Abstract: Numerous restorative plants having incredible rudimentary and therapeutic significance which are the blessing to individual to keep up their sound way of life. *Embllica officinalis* generally known as Indian gooseberry or Amla, has fundamental worth in customary arrangement of medication, including Ayurveda for restorative and dietary purposes to develop lost imperativeness and power. Various phytochemicals separated from *E. officinalis* with its ethnomedical and pharmacological possibilities with sub-atomic components are compactly pondered in this article. Amla has a more noteworthy potential worth not just in human existence even it has phytochemicals that have cell reinforcement and hostile to viral exercises that suddenly battle against microorganisms limited to the illness, guided by a few analysts and distributed in articles and furthermore in books. Extra data was acquired from different books. The phytochemicals of *E. officinalis* removed from unmistakable part particularly from natural product which contain number of phytoconstituents with higher measure of polyphenols like gallic corrosive, ellagic corrosive, various tannins, minerals, nutrients, amino acids, fixed oils, and flavonoids like rutin and quercetin. Illness like irritation, malignancy, osteoporosis, neurological issues, hypertension along with way of life sicknesses, parasitic, viral and other irresistible issues can be treated with the most imperative arrangement amla. The fundamental capacities are thought to molecular pathway with guideline engaged with a few pathophysiology with cell reinforcement property which keeps many harm of cell compartments from oxidative pressure as it has cancer prevention agent and antiviral property predominantly free extreme foragers. Despite the fact that genuine endeavours are needed in foundational research chiefly to recognize, separate and furthermore to assess the compound constituents for dietary and restorative possibilities. Though serious efforts are required in systemic research mainly to identify, isolate and also to evaluate the chemical constituents for nutritional and therapeutic potentials. *E.officinalis* possess pharmacological activities with enormous pathophysiology activities and several mode of actions including antioxidant, anticancer, immune modulator, anti-inflammatory, cyto-protective properties include invasive spectrum. The clinical applications are in managing diabetes, dyslipidemia, obesity, several types of cancer, liver disorders, arthritis, gingivitis, blood clotting property suggested by many medical researchers. From the experimental studies and clinical trials of *E. officinalis* with emphasis on its immuno-enhancer, anti inflammatory and anticancer activities and to provide future directions in mainly clinical research. Here the review is analyzed and Summarised regarding the context of common cold.
