Thus, when Indian educational scenario is surrounded by such road blocks there is a need and necessity of strategic intervention to solve the problems of the educational system. Education should be designed in such a manner that it should bring critical consciousness among the students so that they can solve their problems by the knowledge they have acquired. In a better way following the Chinese proverb it can be said that "Give a man a fish and he eats for a day; help him learn how to fish, and he eats for life". Education should solve this purpose by igniting inner talents of the students. To satisfy the purpose of a meaningful education, it should be imparted in an attractive and fascinating manner. In an era when we are chatting about edutainment with slogans like "Karlo Duniya Muthi Main" and when android phones have started reaching to the vibrant new generation and the youth of this country have started loving technology the technology in itself is a solution to such problem.

With the repaid growth of technology we have reached to an era in which a sim card is cheaper than 1kilo rice, Mobile phones are sold with offers during festivals like dresses, our food is from Swiggy or Zomato, our travel depends on OLA or Uber, our clothes are from Myntra, our medicines are from netmed.com, our grocery shop is amazon, our fruit and vegetables are from bigbasket.com. our restaurant waiter or exam invigilator is a robot and along with Artificial intelligence and machine learning, we have started living in an era of man machine interface. Our relationships have gone shifted to virtual platforms and relationships in the physical environment are pushed to the corner. Our money has become the plastic money, our book has turned to the e-reader and our pen these days is the voice to text keyboard or the paint brush is the joystick. Thus the society surrounding us has changed, the cultural patterns have changed and our involvements with the social institutions have changed. Thus in such an environment of artificial intelligence and augmented reality or virtual reality we have started living in the environment of new educational and information technology and as a user centric and democratic platform, it has brought changes in the communicative behavior of its users. Concepts like edutainment and infotainment type have started becoming the reality of the day. Large amount of information is getting shared everyday through video based platforms to communicate with people in an effective manner to influence communication behaviors of people.

You Tube a powerful and popular platform

YouTube, the most popular video platform of internet was founded by Steve Chen, Chad Hurley, and Jawed Karim. All these three people were employees of PayPal. In its initial days, YouTube did not have much market recognition. On October 9, 2006, Google Inc. announced that it had acquired YouTube. Google's acquisition of YouTube changed

its fate. Later In 2010, it started free streaming of certain content. But in present scenario the market studies say that YouTube is the dominant provider of online video in most parts of world.it not only spreads entertainment content rather it also provides content on education and information in an attractive manner. Due to YouTube, the student community is capable of getting knowledge from top level professors of world. The YouTube as a powerful medium of modern communication has gone able to satisfy the communication needs of people in various manners and by character is quite different from the conventional media system. To speak in a nutshell, it is:

.

- Mostly participatory and the rate of involvement of audience is very high.
- Audience has maximum opportunity to play the role of communicator and receiver.
- A liberal and democratic form of communication with ample opportunities for freedom of expression
- It is a new and attractive form of communication
- Creates a virtual world to provide a better satisfaction in communication.
- Communicator and respondent are known to each other.
- Individual members of the audience are mostly linked with a similar cultural background which makes the communication more effective.

The YouTube with above advantages and with its audio visual contents has become the potential new medium of today and it has started satisfying the uses and gratification perspective of people in a powerful manner. It has gone associated with our lives in such a manner that it has started influencing our lives in almost all spheres.

Economic Life and YouTube

The YouTube has become an industry itself today. The you tube channels are now new platforms of media business for creative people. YouTube is promoting financial literacy among people these days and it is become a new platform to promote business and has proved its effectiveness.

Cultural Life and YouTube

YouTube has become the new platform for cultural exchange. By YouTube we are able to know the cultures of people at different places. We are knowing about traditions and rituals associated with different societies. Folk dance, music and festivals are spreading among people through YouTube. Similarly the media and entertainment industry has also started using YouTube to highlight cultures of different people through their own programs. In fact new forms of culture are created and cultural diffusion has taken place through YouTube.

Social life and YouTube: Due to its wide presence YouTube has started influencing the social life in a powerful manner. In regular intervals contents in YouTube are highlighting issues of social interest and at the same time it is also talking about different discriminations and disparities prevailing in our society.

Educational Life and You Tube

YouTube has proved its usefulness through its audio visual contents. It has become a great source of knowledge distribution and information dissemination. Learning has gone easy due to video based explanations and demonstrations.

Legal life and YouTube

The YouTube in these days have started influencing the legal life of people because through YouTube different legal awareness forums have started creating videos for legal awareness among people and at the same different information relating to legal life have started influencing people.

Religious life and YouTube

May it be Durgapuja, Ramzan or Christmas these days the YouTube has become an important medium to spread the messages relating to religion. Advantages of using YouTube for Education: Anytime, Anywhere- YouTube as a tool

of communication is easily accessible and have no limitation of time and space. Information sharing through YouTube has gone popular all over the world. So lots of knowledge and information are getting shared by using YouTube by large mass of people. New ways of imparting education: YouTube has opened up new ways for teaching and learning. With the advent of YouTube, learning is no more restricted to printed books or materials rather list of learning materials have gone extended to video lectures and demonstrations starting from online study material. The open educational resources have started providing learning materials at free of cost. Low cost of Production: In most of the cases it is considered that production and distribution of YouTube based educational content involves more cost but as they have a wide reach and they are available in a potential forms with more possibilities of success, the production cost ultimately goes low. Considering the qualitative education aspect we can use YouTube in more easy and meaningful way.

Present scenario

In Indian scenario the number of instances of using YouTube for education have increased a lot and it has started reaching to all areas of life to bring changes. Looking towards the modern youth mindset telecom companies have started emphasizing more on data than calls. Thus these days the learners have started using YouTube in a more and more manner and if we will look into the modern learners, then we can realize it that with smartphones in their hands they have started gathering knowledge for their own need. Education has started becoming more and more interest oriented than compulsion. Thus, there is a necessity to understand the preferences and habits of the new age learners and their perceptions relating to YouTube as a learning platform.

Methodology and the Study

To understand the real scenario about learning preferences and perceptions of the new age learners relating to YouTube, a survey among the media students of Bhubaneswar from different media institutes located in Bhubaneswar. Media students were taken into consideration because they are the students who are non-technical but still they are the users. Methodology selected for the purpose of the study is survey, using questionnaires .Sampling technique used is convenient sampling. The study is conducted among 100 students. Bhubaneswar campus of the university is selected because in comparison to other 4 campuses of the university this campus has better internet connectivity. The study has used both primary and secondary data. Primary data is collected from respondents through interview and secondary data is collected from books. Magazines and Internet. The variables associated with the study are time and individual exposure to YouTube.

Use of the Medium

All of them have told that they use YouTube and all of them have also expressed that at different times they use YouTube for learning

Attractiveness of the medium

Responding to the question, whether YouTube is an attractive medium for learning, 93% of the users have told that YouTube is an interesting medium for learning and 7% of them have told that it is not an attractive medium of learning. While 60% of the respondents have told that learning through YouTube is more interesting than class room 33% have not become able to answer anything specific and 7% have told that classroom is more interesting

Learning preferences in YouTube platform

Talking about learning preferences in YouTube platform 73% of the learners have told that they prefer YouTube for learning, and 27% told other platforms or class room as their preferred resources. Similarly 40% prefer YouTube video lectures, 26% prefer to learn by joining social media groups, 20% prefer to contact the teacher directly and 14% prefer to contact other people. Talking about content type preference for learning, 51% prefer video lectures, 35% prefer the content depending upon the topic and 14% prefer text based content while learning. 48% of them expressed their dissatisfaction about advertisements in this video platform and 52% told that they do not worry

much about advertisements. 78% told that if they find a good channel matching to their need, they subscribe it and 22% told they dislike subscriptions. 53% told channel recommendations is good and 47% disagreed.

Learning and the nature of the medium

As nature of the medium also influences learning, that is why when asked about the quickness in getting solutions to questions, 93% have told that it is quick medium and 7% have told that they can't say anything properly. Answering to the question relating to the reliability of YouTube as a learning resource, 40% have told that the information available in YouTube are not reliable, 46% told sometimes the information are reliable and sometimes they are not and 14% told that YouTube is a reliable platform to provide correct information for learning.

Scope for improvement

While answering to the question relating to scope of improvement, 93% of the respondents have told that, there is still scope for it to develop as a better platform for learning and 7% disagreed to the fact.

Barriers

Answering to the question relating to barriers in using YouTube for learning, it was found from 35% of respondents that family restrictions are a barrier, 51% told connectivity, 14% told that advertisements and availability of large amount of resources. Talking about the content selection aspect and its' barriers 79% of the respondents told that information overload is an issue in content selection, similarly 14% expressed that they face problem due to their inability to comprehend the information to use it and 7% told they do not find proper information from YouTube to satisfy their learning purpose

CONCLUSION

From the above findings, it can be said that YouTube as a platform of learning has proved itself to be interesting and attractive for the learners of the new generation. Students have started accepting it as one of the prominent learning source due to attractive presentation formats of the content. However the users are also doubtful about the authenticity of the content in YouTube and barriers like internet connectivity or different restrictions are working like road blocks at the same time to establish YouTube as a better learning resource.

End Notes

An approach of educational system conceptualized by Brazilian Philosopher Paulo Freire

Critical consciousness is a stage in learning conceptualized by Brazilian Philosopher Paulo Freire in which there is a self-realization of the challenges and problems by learner by knowledge based empowerment of the self

ABSTRACT

With the advent of the computer and network technology, the size of data generated is increasing rapidly that lead to the growth of emerging applications like social network analysis, semantic Web analysis , which contains a variety of data(structured, semi structured and unstructured)to be processed . The term Big Data has emerged with new opportunities and challenges to deal with such massive amount of data. In modern digital world, the growing data size have resulted in newer ways of Big Data processing frameworks in order to get meaningful insights . For efficient data processing, Machine Learning based Big Data Processing framework has gained popularity among the various researchers. These type of new processing requirements have given a big boost to the development of new Machine Learning based methods for managing & processing them. In this paper it is presented a detailed review on machine learning characteristics in the context of Big Data and highlights the current scenario from different perspectives.

Keywords: big data, machine learning, big-data Processing

INTRODUCTION

Today in every field of study researchers are dealing with large scale datasets and lot of work is being carried out to better harness and process Big Data. The field of studies, that deals with processing of Big Data are like Engineering .Basic Sciences, Social Sciences, Bio-Medical Sciences, Applied Sciences and so on. Various factors that contribute the explosion of digital data like meteorological data, web-log files, sensor data, banking, growing social networks etc, because of which data volume is also growing exponentially . According to the Digital Universe Study, in 2011, 130 Exabyte of data were created and stored in 2005. The amount grew to 1,227 Exabyte in 2010 and was projected to grow at 45.2% to 7,910 Exabyte's in 2015[3]. by 2020, it is projected a third of the data in the digital universe (more than 13,000 Exabyte) will have Big Data value. Since the traditional tools and infrastructure do not work effectively

to handle these large, diverse and quickly generated data sets, there must be technology to capture, manage and process these unforeseen data, but still there are many challenges and issues which need to be tackled.

The advent of Machine learning has been an effective tool which holds tremendous potential in handling modern data challenges. Machine learning is the subset of Artificial Intelligence which has capacity to learn and is being widely used now-a-days in the number of applications like spam filtering, Alexa, Facebook etc. However, to date, there are relatively very few discussions that analyze deeply and systemically the new characteristics of machine learning in the context of big data and to provide various methods based on machine learning for dealing with big data. Remainder of this paper is organized as follows. Section II describes the related work in the literature. Section III presents the scope and relevance of the review on Big Data Processing using machine Learning and finally the summary of conclusion is presented in Section IV.

LITERATURE REVIEWS

because of the complexity of the structure of the big data, in recent years, most of the researchers are focusing on developing new framework for processing large scale data efficiently and to generate insight from it but with the existing technology, big-data processing has been a great challenges among the researchers, to address this issues, a large number of articles have been published by various researchers. for example,

In [1], Changqing Ji et al. presents the big data processing in the context of cloud computing. It discussed the key issues, including cloud storage and computing architecture, popular parallel processing framework, major applications and optimization of MapReduce.

In [2], Satoshi Tsuchiya et al. discussed on distributed data store and parallelization of complex event processing, which are basic technologies of Big Data processing.

In [3], C. L. Philip Chen et al. proposes several potential techniques to solve the Big-Data problem, including cloud computing, quantum computing and biological computing.

However, the above studies have focused on resource provisioning for the initial time.

In [4], Junfei Qiu et al. proposed a reference framework for processing big data based on machine learning techniques with the power of distributed storage and parallel computing.

In [5], Stefania Loredana NITA et al. discussed about big data, and have presented some characteristics of machine learning. It presented the most used machine learning techniques in big data, giving examples of applications for every described technique.

In [6], Junfei Qiu et al. discussed about the challenges of learning with big data and the corresponding possible solutions in recent researches. In addition, the connection of machine learning with modern signal processing technologies was analysed. It reviewed the machine learning techniques and highlight some promising learning methods in recent studies, such as representation learning, deep learning, distributed and parallel learning, transfer learning, active learning, and kernel-based learning.

In [7], Lidong Wang et al. presented some new methods and technology progress of machine learning in Big Data . it also discussed challenges of machine learning applications in Big Data.

In [8], Abdelladim Hadioui et al. gave an overview of the integration of learning analytics models into the phases of pre-processing of massive data in MOOCs, and it highlighted the advantages of integrating massive data into the process of developing learner profiles.

In [9], Roheet Bhatnagar et al. discussed the role of Machine Learning (ML) based algorithms and methods in Big Data Processing & Analytics (BDA). It also discussed key challenges associated with application of ML based approaches .

In [10], Shweta Mittal et al. discussed that since existing ML algorithms are not suitable for analysis of Big Data, ML algorithms needs to be optimized so that they can be effectively used for big data analytics. Optimization can be achieved by various Dimensionality Reduction techniques, Hashing, Data Cleaning, Sampling etc. Also, to minimize

the execution time, parallel programming techniques can be used. Hybrid machine learning algorithms may also be advantageous in case of big data and can be explored to obtain better results. In [11], Chao Shanga et al. reviewed the current status of research in the field of data analytics and machine learning oriented to data-driven monitoring, prediction, control and optimization and analysed the knowledge gaps to be filled in. Most of the above articles focuses on machine learning techniques that are good for processing structured data but they are lacking in processing semi-structured and unstructured data which requires massive computational efficiency and scalability to handle the huge data .Therefore more optimal techniques need to be designed that can process efficiently large volume of unstructured data in a real time manner .

BIG DATA PROCESSING USING MACHINE LEARNING

Big-Data

Big-Data is a term that refers to a huge volume of data that can not be processed or stored by any traditional data storage or processing units.

Big Data is categorized into three types, such as:

- Structured Data
- Semi-Structured Data
- Unstructured Data

Structured Data has a well-defined structure, it follows a consistent order and it is designed in such a way that it can be easily accessed and used by a person or a computer. Structured data is usually stored in well-defined columns in the Databases. Example: Database Management Systems (DBMS). Semi-Structured Data can be considered as another form of Structured Data. It inherits a few properties of Structured Data, but the major part of this kind of data fails to have a definite structure and also, it does not obey the formal structure of data models such as an RDBMS. Example:Comma Separated Values(CSV) File. Unstructured Data is a data which neither has a structure nor follow the formal structural rules of data models. It does not even have a consistent format and it found to be varying all the time.. Example: Audio Files, Images, video files, etc., According to Gartner definition "Big Data are high-volume, high-velocity and/or high-variety information assets that require new form of processing to enable enhanced decision making, insight discovery and process optimization[3].

Machine Learning

Machine learning is a field of study that gives computers the ability to learn without being explicitly programmed, aiming to understand computational mechanisms by which experience can lead to improved performance [4]. Most widely adopted machine learning methods are :

- Supervised learning.
- Unsupervised learning.
- Reinforcement learning.

Supervised learning : means it has a data set that includes the target values to predict. It receives a set of labelled data as inputs along with the desired outputs, and the algorithm learns by comparing its actual output with desired outputs to find errors and then modifies the model accordingly. It uses methods like classification, regression, prediction and gradient boosting to develop predictive model.

Classification problems ask the algorithm to predict a discrete value that can identify the input data as a member of a particular class or group. Regression problems are responsible for continuous data. Here, the input is sent to the machine for predicting the value according to previous instances. And the machine determines a function that would

map the pairs. If it is unable to provide accurate results, backward propagation is used to repeat the whole function until it receives satisfactory results.

Unsupervised learning: means it has a dataset which has no target to be predicted .It uses unlabelled data and find the hidden patterns or structure in data. Unsupervised learning is a type of self-organized learning that helps find previously unknown patterns in data set without pre-existing labels. Various methods includes k-means clustering , nearest-neighbour mapping, and self-organizing maps.

Reinforcement learning: In this method, the machine learn by it-self from its mistakes. Reinforcement learning is a type of learning that is based on interaction with the environment. It is often used for robotics, gaming because it discovers through trial and error. This type of learning has three primary components the learner or decision maker, the environment and actions [5].

Big-Data Processing using Machine Learning

Currently Big Data Processing has been a major focus area of research and many frameworks & techniques have been proposed by different researchers in recent past. But because of its very huge size of datasets with a great diversity of types it becomes difficult to process by using traditional data processing platform Big Data Analytics is helping organizations to improve business efficiency but then there are many challenges & issues associated with Big Data Processing & Analytics for each of the 5 Vs (Volume, Velocity, Variety Veracity, and Value)[9].

Machine learning is a rather efficient mathematics, based on statistical algorithms that can analyze large volume of diverse data sources. However, as the time for big data is coming, the collection of data sets is so large and complex that it is difficult to deal with using traditional data processing tools and models. As a result, some traditional machine learning techniques are unsuitable to this condition and cannot satisfy the requirements of real-time processing and storage for big data. Thus this needs us to explore some new methods with the power of distributed storage and parallel computing to analyze and deal with big data.

Currently several researches are focusing on Machine Learning based methods and their applications as an integral part of Big Data Processing, and also many new developments have happened in this direction..Qiu et al. [6] describes following future trends from different perspectives in ML based applications for Big Data Processing.

- Data Meaning Perspective: It implies as to how to make ML more intelligent to achieve context-awareness.
- Pattern Training Perspective: It implies how to avoid the over fitting during the process of training patterns.
- Technique Integration Perspective: It deals with integrating other related techniques with ML for Big Data
- Processing. Developing a composite, integrated and seamless platform for Big Data Processing have a great
- research potential.
- Privacy & Security Perspective: It provides a research direction for ensuring security and privacy in Big Data Processing using ML techniques.
- Realization and Application Perspective: How and where one must apply ML research in Big Data to gain optimal results. Applying and utilizing the developed ML techniques to real world problems carries huge potential as research area.

CONCLUSIONS

In this paper, an overview about big data is provided and summarized the types and characteristics of big data. Then a comparison of different machine learning techniques is made In order to highlight the use of techniques in the context of big data, The new features of machine learning with big data is then analyzed. Finally, several research

challenges and open issues are presented. This survey is intended to stimulate more interests in research and development of techniques based on machine learning for big data processing. In future it is planned to design a framework for processing big data based on machine learning techniques with the power of parallel processing in the cloud computing environment.

ABSTRACT

This review summarizes the literature on medicinal plants used for the treatment of eye infection in the indigenous system of medicine. Medicinal plants have been used as traditional remedies for many diseases in different parts of the world from many years ago. In creating nations, natural material keeps on being utilized as the essential wellspring of meds in country territories. The eye is one of the most touchy and significant organs of the human body. Glaucoma, conjunctivitis, Cataract, Ocular inflammation, ocular allergy is common ocular diseases of human body. Among them cataract is the main cause of blindness in the world and in glaucoma disease damage the optic nerve. Glaucoma remains the primary driver of visual deficiency grown-up individuals more than 60 years of age. Conjunctivitis is the infection wherein the mucous layer shaped on the inward surface of the eyelid and causes eye bothered. Conjunctiva is a very thin, translucent membrane lining the anterior part of the sclera and inside of the eyelid. Due to many side effects of allopathic drugs, now a day's more numbers of herbal drugs are used for the treatment of eye diseases.

Keywords: Cataract, Glaucoma, Herbal drugs, Medicinal, Ocular disease

INTRODUCTION

Eyes are the organ of vision. They provide animals with vision, the ability to receive and process visual details. Without eye no one can be able to see anything. There are several natural mechanisms work for eyes to protect itself against various types of infection and diseases. For example "Eyelids and eye lashes protect the eyes from dust and any other type of foreign particles". Like that tear gland is present in eyes, from which tear secrets and keep the eye

surface moist. But sometimes due to some abnormal situation create in eyes or due to some foreign particle entry into the eye cause eye infection. After that severe situation created within eyes. A person faces several visual problems and unable to see anything surround him and slowly lost his vision. Eye infection normally caused by bacterial, fungal, viral and other type of micro- organism (1). To cure the eye infection people are using various type of chemical medicines and drugs. As a result, eye infection cure very soon but many side effects are shown and a person face eye sight problem in future. So that people must know the use of various plants for the cure of eye infection. Every plant has some medicinal properties, only people should know how to use them for a particular type of disease. Thus, medicinal plants are considered a good resource for drug development. By using herbal plant parts for various type of eye infection there is no side effect shown in future.

There are many more medicinal plants are present in our world. Among them half million plant species will be frequently used plants in future for drugs and yet many more medicinal plant's medicinal properties not known by people. But with the invention of "Modern medicine" people show disinterest towards herbal medicine and therefore there must be at last of the knowledge of traditional use of medicinal plants (2). Because people get medicine in market with low price and all the medicines are available in market. But to get herbal medicine people must know how to use the plant properly, which part of the plant used for a particular disease, how to make the drug from the plant part etc. So, they prefer chemical drugs first which are easily available in the market.
Various plant parts are used to treat sever diseases as well as wounds, dog and cat bites. It is also used to treat tetanus and to prevent rabies. However, some medicinal plants have major role against different eye infections. Several herbal drugs used against eye infection and there is no side effects (3).

Ethnobotany

"Ethnobotany is the study of a region's plants and their practical uses through the traditional knowledge of a local culture and people and this is also a part of human environmental science that defines the interface between people and plant and provides various types of substances which are needed for rural development based on sustainable yield from plants products" (4). Plants are normally found in open area seem to have potentials to provide options for rural livelihoods and biodiversity conservation for future use (5). These plants can contribute to poverty mitigation serving as subsistence "Safety nets" or low income "gap fillers" and these plants are useful for socio – economic, cultural, industrial and pharmaceutical uses, generating a lot of money annually to the world's economy (6). Ethnobotany is simply defined as the investigating plants used by societies in various parts of the world. It is usually focusing on the interaction of indigenous plants and local inhabitants (7).

The most ethnobotanical studies frequently report on the most important plant families based on a similar count of species used as a medicine (7-9). The university facilities have realized the necessity of introduction of new academic curriculum to train their students (10).Taking into consideration the above mentioned, one of the purposes of our project was to use the ethnobotanical survey as an educational tool for bachelor students. This study is a part of wider survey on current status of medicinal plant knowledge in Balasore district. Maximum people in the world population are uses traditional medicine, mainly medicinal plants for the cure of various diseases (11). The utilization of therapeutic plants in both a significant asset and a need and it likewise give essential medicinal services framework in creating nations (12).

Since long times ago plants have been essential source of defensive and therapeutic traditional remedy measures for humans and livestock. In India, such plants are utilized in treating pains, mucous discharge, wounded animals, constipation, gastric difficulties, headache, aching tongue in kids and fungal infection (13) The worth and information on restorative plants just notable by more established age who are gradually biting the dust with this information prompting the loss of significant data. The part of information and handling technique for unrefined medications are just accessible in rustic are of a specific network and keep up by these families and networks. At the same time youngsters show a lot of enthusiasm for formal instruction and once in a while get inspired by conventional information on restorative plants, therefore, quite a bit of these customary information remains and

announced and nearly getting lost. The viability of the vast majority of the natural medications has not been tried to verify the generally guaranteed rule in illness the board (14).Be that as it may, because of progress in way of life negatively affected keeping up conventional information on home grown cures; henceforth there is a risk of loss of this information. There is escalating decline of traditional medicine practitioners and consequently a loss in authentic traditional knowledge. (15).

Because of overexploitation and brushing of plant assets have just prompted a misfortune to the plant material accessible (16). Although there is much more progress occur in case of allopathic medicine, tribal people prefers herbal drugs for the cure of several diseases of mankind and pet animals. Total 80 percentage of the world population depend on herbal and traditional medicine (17). Because of better similarity, better social agreeableness with the human body and have lesser symptoms, these are oftentimes utilized in creating nations. There must be progress in tribal welfare for the development of ethnobotany. The world is outfitted with a rich abundance of restorative plants and these plants are a neighborhood legacy with worldwide significance. Plants have given a wellspring of advancement to novel medication compound which have made an enormous impact on human wellbeing and prosperity. They have various principles in that, they may turn into the base for the improvement of new medications and fill in as phytomedicine for the treatment of irresistible illnesses including the shrewd AIDS disease (18). The markers of medicinal plants have acquired some knowledge of the issues of some of these plants by interacting with the suppliers and end users. More authentic information on the curative properties of medicinal plants this can be obtained from practitioners of alternative medicine. Some of each practitioner's supply extracts packaged in various containers stating their curative properties but revealing little or no information on the plant materials contained therein.

Eye infection

The eye infection occurs when harmful foreign particles enter into the eyes and cause several disturbance inside the eyes, as a result a person face various eye side problems. It occurs when a potentially harmful micro-organisms like a fungus, a virus or a bacteria invade your eye ball or the area surrounding your eye. Simply the definition of eye infection is an infection of the sebaceous gland of the eyelid.
Various types of eye infections are described below:

Bacterial Eye Infection

When eye infection caused by various types of poisons bacteria that is called bacterial eye infection. "Among them *Streptococcus pneumonia, Haemophilus influenza, Staphylococcus aureus, Escherichia coli, Pseudomonas aeruginasa, Staphylococcus epidermidis, Bacillus cereus, Chlamydia trachoma* and *Neisseria gonorrhea"* (19). *C. Trichomatis* bacteria caused Trachoma which is the world's most dangerous eye infection which leads blindness and ocular morbidity (20). There are 146 million people suffering from trachoma eye infection. Burning, disturbance, tearing, and generally a mucopurulent or purulent release and so on are the manifestation of bacterial eye contamination. And also, in the morning eyelids are stuck together specially at the morning time. Usually bacterial eye infection is self-limiting. But if left untreated them develop into more serious eye side problem in eyes. It often improves in two to five days without treatment but can take two weeks to go away completely (21).

Fungal infection

There are various types of fungus by which eye infection caused, these are as *"Fusarium solani, Fusarium oxysporum, Aspergillus niger, Aspergillus flavus, Candida albicans* and *Penicillium notatum"* (22). The above-mentioned funguses are very dangerous. If someone infected may lose the vision capacity and become blind (22). The symptoms of fungal eye infections are eye pain, eye-redness, blurred vision, sensitivity to light, and excessive tearing eye discharge (23). After fungal spores go into the eye from an outer source, exogenous contagious endophthalmitis happens. When a blood stream infection spreads to one or both eyes, endogenous, endophthalmitis occurs. Fungal eye infection lasts seven to ten days. Contagious eye contaminations are amazingly uncommon, however they can be intense if

untreated. The most widely recognized path for somebody to build up a contagious eye contamination is because of an eye injury, especially if the injury was brought about by plant materials, for example, a stick or a thistle (24).

Viral Eye infections

When eye infection caused by various types of virus, it is called viral eye infection. Among them simplex virus-I, Adenovirus and Coxackievirus etc.(25). In developing country ocular infection caused by HSV-I virus which leads to blindness (26). HSV-I caused 95% of ocular harps. Usually viral conjunctivitis produces a watery discharge .Typically the infection starts from one eye and quickly spreads to other eye. No eye drops or ointments are effective against the common viruses that cause viral conjunctivitis (27).

Ocular disease

Glaucoma

"Glaucoma is a group of eye conditions that can cause blindness. With all types of glaucoma, the nerve connecting the eye to the brain is damaged, usually due to high eye pressure". Much of the time, glaucoma is brought about by higher-than-ordinary weight inside the eye-a condition called visual hypertension. Yet, some of the time glaucoma can happen in any event, when the weight inside the eye-called intraocular weight or "IOP" is typical (28). "Intra ocular pressure (IOP), ageing, family history, high myopia, systematic hypertension, cardio vascular disease, migraine headaches, peripheral vasospasm and prior nerve damage are some of the important recognised risk factors for glaucoma". Glutamate induced neurotoxicity, nitric oxide based damaged, disruption of neurotrophic factor transport and induced neuro- destruction is the leading possible factors of glaucoma. The liquid inside the eye, called fluid amusingness, as a rule finishes off your eye through a work like a channel. On the off chance that this channel gets blocked, fluid develops. Now and again, specialists don't have the foggiest idea what causes this blockage, yet it tends to be acquired importance it's passed from guardians to kids. Less basic reasons for glaucoma incorporate an unpolished or synthetic physical issue to your eyes. Serious eye disease blocked vein inside your eye and fiery conditions. The following types of glaucoma (29-31):

Open angle (Wide angle, chronic simple glaucoma)

"This is the most common type of glaucoma. Doctors are also called it wild angle glaucoma. The drain structure in your eye looks fine, but fluid does not flow out like it should". "It is probably a genetically predisposed degenerative disease affecting patency of the trabecular meshwork which is gradually lost past middle age".

Angle closure (narrow angle, acute congestive) Glaucoma

This is more common in Asia. "It also called acute or chronic angle- closure or narrow-angle glaucoma. Here eye does not drain like it should because the drain space between your iris and cornea becomes too narrow. As a consequence this can cause a sudden built up of pressure in your eye. It's also linked to farsightedness and cataracts, a clouding of the lens in your eye".

Secondary Glaucoma

"This is another type of glaucoma. When, a person suffering from cataracts or diabetes than this type of eye disease occurs due to increase pressure in eyes".

Pigmentary Glaucoma

In this case of eye infection tiny bits of pigment from eye iris, which is the colored part of our eye, get into the fluid inside eye and clog the drainage canals. A large portion of the individuals with open-edge glaucoma don't have any side effects. In the event that side effects do create, it's typically late in the illness with the goal that this sickness frequently called the (Sneak hoodlum of vision). For the most part, edge conclusion glaucoma indications come quicker and increasingly self-evident. Seeing coronas around lights, vision misfortune, redness in your eye, an eye that looks dim, upsets stomach or spewing and eye torment are the manifestations of glaucoma.

Cataract

"Cataract is a clouding of the normally clear lens of eye. people who are suffering from cataract, seeing through cloudy lenses is a bit like looking through a frosty or fogged-up window clouded vision caused by cataracts can make it more difficult to read, drive a car or see the expression on a friend's face". Early on most of cataracts develop slowly and don't disturb a person's eyesight but with the increase of the time it will eventually interfere with his vision. Cataract is a multifactorial disease and it is very important to identify the risk factors which cause cataract eye disease. These are various toxic factors, environmental, stressors and gene mutations.

Infection conjunctivitis

Conjunctivitis is a bothering or irritation of the conjunctiva, which covers the white piece of the eyeball. It very well may be brought about by sensitivities or bacterial or viral diseases. Conjunctivitis can be incredibly infectious and is spread by contact with eye emission from somebody who is tainted. On the off chance that conjunctivitis is brought about by a typical viral contamination and no different confusions happen, at that point your eyes should clear up inside a couple of days to about fourteen days. Be that as it may, when it is brought about by microorganisms, which even with treatment, for example, remedy anti-microbial eye drops can last as long as a month or more. By touching a unhygienic surface or by skin to skin contact it spreads from person to person. Symptoms include redness, itching and tearing of the eyes. It can also lead to discharge or crusting around the eyes.

Viral conjunctivitis

Viral conjunctivitis is an exceptionally infectious intense conjunctively contamination for the most part brought about by adenovirus. Manifestations incorporate disturbance, photophobia, and watery discharge.80% of instances of intense conjunctivitis are brought about by infections (32). 65% to 90% of instances of viral conjunctivitis are brought about by adenoviruses (33) and furthermore produce two kinds of basic clinical substances related to viral conjunctivitis. Pharyngo conjunctival fever and epidermic keratoconjunctivitis (34).

Bacterial conjunctivitis

Bacterial conjunctivitis is a typical kind of pink eye, brought about by microscopic organisms that taint the eye through different wellsprings of pollution i.e. abnormal proliferation of the native conjunctival flora, (35). Bacterial conjunctivitis is usually caused by "*Staphylococcus aureus, Streptococcus pneumonia, Haemophilus* species or less commonly, *Chlamydia trachomatis"*. The main symptoms of bacterial conjunctivitis include pinkness of the eyes, burning, itching sensation of grittiness or mild pain or discomfort in the eye, swollen and reddened eyelids. The course of the disease usually lasts 7 to 10 days (36).

CONCLUSION

This study has revealed that medicinal plants still play a very important and vital role in the provision of primary health care for the people. Just because of eye is the most important part of organ of human body. So, it should not be right to apply any chemical drugs for eye infection. In our surrounding many herbal drugs are present, which we can be used against different diseases particularly for eye infection and by using this there is no side effect cause. Thus people only should know the technique of using this herbal drug for particular disease.

Table : 1. Types of cataract

Types of cataract	Causative Factor	Vulnerable People
Senile Cataract	"This cataract is caused due to the opacity of the eye lens by natural ageing process".	Elderly persons, mostly those over the age of 60 years.
Traumatic Cataract	"This cataract is caused due to some physical damaged to the eye lens capsule, such as that due to the entry	People working in hazardous condition such as welders and those in glass fornaces.

	of a difficult to remove foreign object".	
Complicated cataracts	"This cataract is the complication of some other chronic disease in the person".	Patience of diabetes and emphysema, asthma etc.
Congenital cataract	"This cataract is caused in infants if the mother had contracted German measles during pregnancy".	New born infants
Toxic cataracts	"This cataract is caused due to long term use of medicine or chemicals that are toxic to the eyes".	People using eye drops containing prednisone and cortisone for a long time. Also smokers as they inhale toxic fumes which affects the eye lenses.

Table:2.List of medicinal plants used against eye infection (37-44):

Sl. No.	Botanical Name	Local Name	Family	Parts Used	Uses in eye disease
1	*Acacia nilotica*	Kikar	Mimosaceae	Whole plant	For burring sensation in eyes
2	*Allium Sativum*	Garlic	Liliaceae	Bulb	Opthalmopathy, sore eyes
3	*Aloe vera*	China kalabanda	Liliaceae	Leaf	Ocular diseases
4	*Cadaba indica*	Patrika	Capparaceae	Leaf	Ocular diseases
5	*Camellia sinensis*	Green tea	Commelinaceae	Inflorescences	Conjunctivitis
6	*Capparis deciduas*	Kareera	Capparidaceae	Leaf	Corneal opacity
7	*Capsicum annum*	Capsicum	Solanaceae	Seed	Ocular diseases
8	*Carissa opaca*	Granda	Apyocynaceae	Stem, leaf, Fruit	Ocular diseases
9	*Cassia absus*	pig's senna	Caesalpiniaceae	Leaf, seeds	Ocular diseases, strengthens eye sight
10	*Cassia auriculata*	Avaram Senna	Caesalpiniaceae	Seed	Eye infections
11	*Cassia italica*	Balibali	Caesalpiniaceae	Leaf	Ocular diseases
12	*Cassia obtusifolia*	Juemingzi	Leguminosae	Seed	Eye infection
13	*Cassia occidentalis*	Peedachennangi	Caesalpiniaceae	Leaf	Sore eyes
14	*Cassia tora*	Tailancha	Caesalpiniaceae	Leaf, seed	Ocular diseases
15	*Celosia argentea*	Guruguaku	Amaranthaceae	Seed, leaf	Blurred vision, eye inflammation
16	*Centaurea calcitrapa.*	Red starthistle	Asteraceae	Whole plant	Ocular diseases
17	*Chenopodium album*	Bathu Saag	Chenopodiaceae	Whole plant	Ocular diseases
18	*Clitoria ternatea*	Blue pea vine	Fabaceae	Root, Leaf	Eye inflammation
19	*Costus afer*	Spiral ginger	Costaceae	Rhizome, Leaf	Ocular diseases
20	*Crepis cameroonian*	Hawk's-beard	Asteraceae	Leaf	Ocular infections
21	*Curcuma longa*	Turmeric	Zingiberaceae	Rhizome	Ocular diseases

22	*Curcurbita pepo*	Pumpkin	Cucurbitaceae	Fruit	Good for eyes
23	*Cyperus nevieus*	Deela	Cyperaceae	Root	Eye sore
24	*Cyperus rotundus*	Mustaka	Cyperaceae	Rhizome	Ocular diseases
25	*Datura metel*	Dhutra	Solanaceae	Leaf, root, Seed	To enlarge pupil in eye
26	*Datura stramonium*	Datura	Solanaceae	Seed	Iritis
27	*Daucus carota*	Carrot	Umbelliferae	Seed	Eye sight, glaucoma
28	*Desmodiumincanum*	Creeping Beggarweed	Fabaceae	Bark	Eye problem
29	*Euphorbia hirta*	Dodhi	Euphorbiaceae	Leaves, Inflorescence	Redness of eyes, remove foreign body from eyes
30	*Ficus benghalensis*	Bargad	Moraceae	Latex, stem	Eye pain
31	*Flacourtia indica*	Rakatsonk	Flacourtiaceae	Leaf	Conjunctivitis
32	*Foeniculum vulgare*	Fennel	Apiaceae	Leaf, flower	Conjunctivitis
33	*Fuerstia africana*	Birirwobsot	Labiatae	Leaf	Eye problems
34	*Fumaria officinalis*	Paptra	Fumariaceae	Leaf, stem, Flower	Conjunctivitis
35	*Ginkgo biloba*	Maidenhair Tree	Ginkgoaceae	Leaf	Retinal vein occlusion, glaucoma
36	*Heliotropiumindicum*	Hatisuri	Boraginaceae	Leaf, root	Conjunctivitis
37	*Iris germanica.*	Lirio	Iridaceae	Flower	Conjunctivitis
38	*Jasminum arborescens*	Jasmine	Oleaceae	Leaf	Eye problems
39	*Jasminum officinale*	Chameli	Oleaceae	Root	Eye problems
40	*Jatropha curcas*	Adaviamudamu	Euphorbiaceae	Latex	Ocular infections
41	*Jatropha gossypifolia*	Ratanjot	Euphorbiaceae	Latex	Corneal opacity increase eye sight
42	*Juniperus excelsa*	Apurs	Cupressaceae	Seed	Ocular diseases
43	*Kalanchoe densiflora*	Air Plant	Crassulaceae	Leaf	Conjunctivitis
44	*Kalanchoe pinnata*	Air Plant	Crassulaceae	Leaf	Ocular diseases
45	*Lepidium sativum*	Zachik	Brassicaceae	Seed	Eye problems
46	*Leucas aspera*	Kubi	Labiatae	Leaf	Ocular diseases
47	*Leucas aspera*	Thummi	Lamiaceae	Leaf	Ocular infections
48	*Lippia nodiflora*	Poduthazhai	Verbenaceae	Whole plant	Ocular diseases
49	*Luffa acutangula*	Ridged Gourd	Cucurbitaceae	Leaf	Granular conjunctivitis, prevent excessive meihomian secretion
50	*Lygodium salcifolium*	Chumng	Lygodiaceae	Leaf	Pain in the eyes and night blindness
51	*Madhuca indica*	Madhuka	Sapotaceae	Flower	Ocular diseases
52	*Mangifera indica*	Mango	Anarcardiaceae	Unripe fruit	Blindness
53	*Manihot esculenta*	Bankye	Euphorbiaceae	Leaf, root	Ocular diseases

ABSTRACT

India is the land of biodiversity. Nature acts as a good providing source for both human being and animal kingdom. Allelopathy has been known and utilized in agribusiness since the antiquated occasions. Allelopathy is a typical natural marvel by which one life form produces biochemicals that impact the development endurance advancement and propagation of different organisms. These biochemicals are known as allelochemicals and have helpful or hindering consequences for target living beings. To guarantee practical farming improvement it is imperative to abuse development frameworks that exploit the stimulatory/inhibitory impact of allelopathic plants to direct plant development and advancement and to keep away from allelopathic autotoxicity.

Keywords: Agribusiness, Allelopathy, Biochemicals, Farming, Plants

INTRODUCTION

"Allelopathy is a part of chemical ecology which concerned with the effects of chemicals that is produced by plants on the growth; it helps for the development and distribution of other plants in natural communities" (Einhelling, 1995). "The term allelopathy was first introduced by Molish in 1937 to show all of the effects that result from biochemical substance which move from one plant to another" (Molish, 1937). The collaboration of allelopathic is one of the critical elements give to species dispersion and a huge amount inside plant networks and it additionally assume significant job in the achievement of intrusive plants (Chou, 1999; Mallick and Mohan, 2003; Inderjit et al., 1997). Plant discharged a few synthetic substances and executing allelopathic impact are named as allelochemicals or allelochemics and allelochemicals are the optional plant metabolites, that is biosynthetically gotten from the essential

metabolites of the plant (Torres et al., 1996).After some year later, the algae, fungi and various microorganisms are accepted as targets of allelochemicals.

This form was polished by Rice (1984) to state that "any direct or indirect harmful or beneficial effect by one plant (including microorganisms) on another through production of chemical compounds that escape into the environment" (Rice, 1984). Allelochemicals contains several type of chemical families and they are divided into following 14 categories, which is based on chemical similarities like: "water- soluble organic acids, straight-chain alcohols, aliphatic aldehydes, and ketones; simple unsaturated lactones; long- chain fatty acids and polyacetylenes; benzoquinone, anthraquinone and complex quinines; simple phenols, benzoic acid and its derivatives; coumarin; flavonoids; tannins; terpenoids and steroids; amino acids and peptides; alkaloids and cyanohydrins; sulphide and glucosinolates; and purines and nucleosides".

Allelochemicals can direct or restrain plant germination and development, and permit the advancement of yields with low phytotoxic buildup sums in water and soil, in this manner encouraging waste water treatment and reusing (Macias et al., 2003). These were a suitable substitute for manufactured herbicides in light of the fact that allelochemicals don't have harmful impacts, in spite of the fact that the viability and disposition of numerous allelochemicals are constrained (Bhadoria, 2011). Exploration of allelopathy prompts the motivation behind application which watched allelopathic impacts on farming creation, reduction of the contribution of substance pesticides and subsequent natural contamination and giving viable strategies to the practical improvement of horticultural creation and environmental frameworks (Macias et al., 2003). In agribusiness, the allelopathic crops are utilized as of late being acknowledged, e.g., as segments of yield turn, for intercropping, as spread harvests or as green excrement (Cheema and Khaliq, 2000; Sing et al., 1999; Irshad and Cheema, 2004; Iqbal et al., 2007).

There were several competitions occurring in among cultivated crops and their nearest plants (Inderjit and moral, 1997; Xian et al., 2005). Allelopathy contain a chemical mechanism which give an benefit for challenging for inadequate resource in plants (Singh et al., 1999). In fields the weeds were controlled by using crop allelopathy, to alleviate allelopathic autotoxicity and reduce inhibitory influence among allelopathic crops (Iqbal et al., 2007; Farooq et al., 2011a). By using crop rotation and intercropping systems, biomass production and weed population density can be significantly reduced (Liebman and Dyck,1993). So the allelopathic nature of crops must be advised in intercropping, crop rotation and stalk mulching (Xuan et al., 2005). Allelopathic plants used as land wrap genus, that provides an ecological forthcoming option (Dhima et al., 2006). In the South-eastern region of Brazil, the fruit peels of coffee (*Coffea arabica*), that contain allelochemicals like: caffeine, phenols and flavonoids, which is used as an organic amendment in agricultural practice to control weeds (Silva et al., 2013). From allelopathic plant, there are some natural herbicides or plant development inhibitors are produced to restrain weed development in fields (Guillon, 2003).

ABROAD
CHINA

The primary distribution presenting the word allelopathy in the Chinese writing of this exploration is distributed in the Chinese with the monograph "Allelopathy and its application" (Kong and Hu, 2001). From Chinese germplasm collections the allelopathic rice and wheat admittances were appraised and screened (Kong et al. 2002; Zuo et al. 2005). A new method has been developed using chemical fingerprinting to evaluate allelopathic crop admittances and individual plants in a non-destructive manner (Kong et al. 2002). At early development arranges, the root exudates from *A. hypogaea*, before the arrangement of root knobs, advanced development of rice, maize, radish and rye grass. This is by all accounts because of the root exudates of *A. hypogaea* triacontanol is found at 1-3 leaf development stage, which effectsly affects the plant development (Hu and Kong, 2002). The growing allelopathic wheat varieties considerably decreased the weed biomass in several corn crops and also reduce weed infestation in

the wheat field which is demonstrated in the field experiments (Ma et al. 1996). The restraint of all wheat genotypes, barring *Secale cereale* L., had allelopathic impacts; brought about by the wheat genotypes expanded as their genome changed from 2n to 4n to 6n (Zuo et al. 2005). The beneficial outcome on the creation allelochemicals, because of the nearness of *E. Crus-galli* , herbicide stress, bright light, jasmonic corrosive application and furthermore substantial metal harm (Kong et al. 2004a; Zhao et al. 2005).A cross between Indica rice assortment Zhong 156 Gumei 2 was attempted to outline quality liable for the allelopathic impact on farm grass, which is gotten from a populace of 134 recombinant ingrained lines (RILS) (Xu et al. 2003).

In China, the allelopathy of different sorts of weeds, particularly extraordinary weeds, have been examined, that is *Ageratum conyzoides* L. Has been concentrated in detail (Kong et al. 2004b). The weeds were effectively suppressed and controlled other insect pests by the intercropping of *A. conyzoides* in citrus orchards. Through the ageratochromene and other allelochemicals released into soil by *A.conyzoides*, the weed and soil pathogenic fungi were effectively suppressed (Kong et al. 2004c). *C.equisetifolia* released some allelochemicals, which inhibited root growth of *C. equisetifolia* seedling and that is showed by research (Deng et al., 1996). From *C. Lanceolata* litter and soil in *C. Lanceolata* woods, a few allelochemicals were confined and they fundamentally repressed the ghowth of *C. Lanceolata* seedlings and in this way influenced the recovery procedure (Chen et al., 2005). In several aquatic ecosystems, the algal and macrophytes were antagonistic to each other (Xian et al. 2005). Under different environmental conditions the allelopathy and competition between *A. tatarinowii* and algae were investigated (Ye et al., 1999).

PAKISTAN

Prof. H.M. Naqvi began researching the allelopathic capability of many grass species while working at the University of Peshawar in Pakistan. Dr. Farrukh Hussain has accomplished the work in certain different species and discovered outcomes especially from buffel grass (*Cenchrus ciliaris*); which buffelgrass restrained the germination and shoot development of foxtail millet (Setaria italic), cattail millet (*Pennisetum americanum*), lettuce (*Lactuca sativa*) and mustard (*Brassica campestris*), when Naqvi moved to the US in 1975 (Hussain and Anjum, 1981). Allelopathic impacts of millet, sorghum and pear were changed by manure and customary culturing (Arshad 1995). Two national ventures have finished by Cheema and his partners at various areas in Punjab, Pakistan. Acombination of allelopathic crops removes (brassica, sunflower, sorghum) can diminish the herbicides utilization by 50 to 75% in field harvests, for example, maize, rice, wheat and cotton were finished up by them (Irshad and Cheema, 2004; Iqbal and Cheema 2007; Jamil et al. 2009). Water concentrate of mulberry (Morus alba) joins with the sunflower and sorghum which repressed weeds in wheat fields (Jamil et al 2009). The brassica dust is contain some sign of promotive impacts and brassinolide compound is distinguished (Grove et al. 1979).

Several reports state that certain growth process as germination of different test species were stimulate by allelopathic extracts at lower concentration (Cheema 1988; Randhawa et al. 2002). It was considered that two splash of canola and moringa blend showered at 40 and 30 DAS, which expanded blend grain yield by 83% (Hussain, 2010). On the planet over, there is an ever-expanding push for naturally delivered materials. There has been an attention on plant-inferred wares as an eco-accommodating methodology which can the substitute herbicide for weed the executives during last two decads (Cheema et al., 1997).

RUSSIA

Red root amaranth (*Amaranthus retroflexus* L.) is distributed world wide, which is a serious destructive weed, especially in garden, orchards, farmland, wasteland and the roadside. Due to its large amount of seed and strong flexibility its control is very hard. The growth of several crops can seriously affected by red root amaranth and it causes great loss to agricultural production (Costea et al., 2004; Li et al., 2004). In North America an exotic invasive

plant is found that is "*Acroptilon repens* (L.) DC (Russian knapweed; formely *Centaurea repens*), a perennial herbaceous plant belong to family Asteraceae, which suspected to be allelopathic" (Fletcher and Renny, 1963). Russian knap weed contain phytochemicals which is harmful to other plants (Stermitz et al., 2003). In North America it is a persistent weed problem, because of its extremely reasonable character and broad environmental flexibility (Goslee et al., 2001).

These monocultures have been allocated to various variables, similar to adaption to unsettling influence, and it contains a broad root framework, and through the creation of natural allelopathic synthetics it obstruction with neighboring plants (Selleck 1964; Goslee et al. 2001). The creation of harmful natural-synthetic concoctions are completed by the impedance between plants (Harper 1977). The term "elemental allelopathy" is defined as the intervention mediated throughout the addition and concentration of non-living elements (Boyd and Martens 1998). "Biochemical allelopathy has been studied by speculation and assumptions" (Inderjit and Del Moral 1997). There is a cool-season bunchgrass called *P. Soicata* which is a less competitor with many invasive weeds. Also *P. Juncea* is a cool season bunchgrass which is inhibited by *A. repens* and that was expected to be tolerant of elevated Zn levels (Bottoms and Whitson 1998; Monsen et al. 2004).Within an *A. repens* monoculture, high Zn riched soil was collected from the top 7.5 cm layer (Bottoms 2001).

INDIA

The term "allelopathy is defined as some direct and indirect effect of one plant on another through the production of chemicals" (Rizvi and Rizivi, 1999). Generally, the allelopathic compounds present in natural plant communities, these are contain a mechanism by which weeds interfere with crop growth (Bell and Koeppe, 1972).The germination and growth of crops are affected by several weed species due to its toxicity. There are some major problems in the rice production field to manage the weed, which is a challenge for the rice farmers. In China, the annual loss of rice production is 10 million metric tons due to weed competition (Zhang, 2001).

Holm et al. Reported that *Cyperus iria* L. Is one of the most common weeds of rice in Srilanka, India and Philippines. Association between *C. Esculentus* and *P. hysterophorus* that show a huge impact on radical length, germination rate, plumule length, new weight, and dry load of seeds. "Any process involving secondary metabolites produced by plants, microorganism, viruses and fungi that influence the growth and gdevelopment of agricultural and biological systems, including positive and negative effects", this statement was defined by the International Allelopathy Society in 1996 (Rice, 1984). From plants several chemicals released and imposing allelopathic influences are known as allelochemicals or allelochemics (Torres et al., 1996). The growth, germination and development of severalplants are affected when they exposed to allelochemicals (Inderjit and Moral, 1997). These compounds are also known as 'natural herbicides'. "The allelopathic effect of hydroalcoholic extract of ashwagandha (*Withania somnifera*) can used for the germination and radical growth of *C. arietinum* and *T. aestivum"* (Macias, 1995).The radical growth and percentage of germination were recorded, which monitor the allelopathic behaviour (Kruse et al., 2000).

Some invasive plant released chemicals which discourage growth of native plants is known as allelopathy (Heirro and Callaway, 2003). Due to allelopathy, Lantana disturbs progression, decline biodiversity, and can lessen life of local plants. The leaf concentrates and leachate of Lantana, that decline the seed feasibility, germination, speed of germination and seedling development limit of *Mimosa* seeds (Maiti et al., 2008)."The aqueous leaf extracts of *L.camara* at different concentrations, that shows inhibitory effect on root, shoot elongation and germination of several food crops like *Cicer arietinum*, *Brassica juncea*, *Phaseolus mungo*, *Cucumis sativus*, *Vigna unguiculata* and *Raphanus sativus*" (Ahmed et al., 1972). The germination of spores of the liverwort *Asterella angusta* was inhibited by leaf extract of *L. Camara* which exhibit a potential against other plants (Kothari and Chaudhary, 2001). The growth of *Parthenium hysterophorus* was inhibited by high concentration of leaf extract of Lantana in flowering stage (Mishra, 2014).

ODISHA

An annual herb like Hyptis, which aggressive nature and that contains several chemicals like phenol, saponin, tannin, carbohydrates, alkaloids, steroids and flavonoid (Mudgal et al., 1997). The leaf extract of *Eucalyptus urophylla*, which inhibit the, root initiation, number of roots and root length of hypocotyls of mung bean and pea (Huang et al., 1997). The aqueous extract of *Hyptis suaveolens* showing the weedicidal effect, so that it contain allelopathic potential (Rao et al., 1987).

ABSTRACT

The Internet of Things (IoT) technologies offer a great scope for educational system to improve learning skill and improve the complete educational operations. IoT in education (IoET) allows transforming traditional education system into adaptable, scalable and effective e-learning in a platform for interacting educational objects. This paper analyzes the manners to achieve enhanced educational practices using IoT that enables the customization of education to give every learner access to their needs and capabilities thus making personalize learning. Besides this, it has investigated the potential of IoT in education for students with disabilities to maintain adaptive and sustainable educational environment through IoT-enabled assistive technology and establish an effective inclusive education system.The objective of this paper is to explore the potential of IoT technologies that can transform effectively in inclusive education and personalized learning.

Keywords: Inclusive education,IoT, IoET, ICT,personalized learning,smart learning.

INTRODUCTION

Inclusive education is the practice of addressing the diversified needs of learners through increasing participation in learning, cultures and communities [1]. The objective is that the entire education system will enable learning atmospheres and each student has an opportunity to succeed [2].Artificial intelligence (AI) offers remarkable potential for use in education. Today's educational institutions intercept many problems like disengaged students, high dropout rates, and the ineffectiveness of a traditional "one-size-fits-all" approach to education [3]. The human has improved the quality in life by making innovative opportunities, services, mechanisms and professional models due to the technological developments. People can interact to the environment with the help of these advances in

different ways and capabilities. Internet is one such technology that redefines the world by interconnection of people and things, referred to as Internet of Things (IoT). Now there is atransformation from Internet of computers into the Internet of people, known as Web 2.0 [4]. An innovative technological trend in the Internet world is the IoT which enables connectivity for anything and for anyone to be interconnected around the globe at anytime and anywhere using any communication technologies to achieve the goal of intelligent detecting, monitoring and handling things. The IoT has the technical properties that enable the advanced services by interconnecting things based on interoperable ICTs. Based on this idea number of devices and things are connected to the Internet, each providing information and services. This technology provides an opportunity for expanding the communication between human to human (H2H), human to things (H2T) or things to things (T2T) for intelligent decision making by interacting with each other [5]. This paper presents a unique Information and Communication Technology (ICT) viz. IoT that is integrated with education for the improvement in personalized learning and inclusive education by addressing learning challenges for disabilities.

Exploring of IoT in Education

IoT in education provides scopes for upgrading the education system in terms of teaching and learning, classroom monitoring, and attendance monitoring automation, student physical and mental health,school security and personalized learning. Integrating IoT in education is referred to as Internet of Educational Things (IoET)that interconnects not only computers, tablets and smartphones, but also it allows connectingevery other educational things to the Internet. Thus it completely changes the traditional model of education [6].IoT is a network of a diversity of connected educational things. Technology in education has played animportant role in integrating and educating the students.The learning activities and the corresponding learning outcomes in the educational institutions are enhanced with the establishment of IoT by providing richer learning tools and pedagogyand gaining real-time interaction with student performance.

The istitutions haveprospect to lead the technical growth and the innovations models for the IoT and has the potential to address the issues like privacy, trust, protection and security associated to the IoT[7]. A Smart educational campus consists of smart IoT-based classroom, lab, sensors, smart educational things, data analytics, cloud computing, artificial intelligence and RFID technology [8]. AnIoT based smart learning system with its important components is shown in figure 1. Educational environment is equipped with advanced learning aids based on smart things such as intelligent sensors with cameras, microphones. IoT in a classroom can help to provide a better teaching and learning environment [9]. The cloud computing system helps to control and manage the activities in the classroom. Smart devices have made it possible for a teacher to adopt dynamic nature of the students. Thus incorporating IoT devices in teaching and learning is a recent trend which provides an innovative approach in educational management.

Role of IoT inPersonalized Learning

In personalized learning, every student will avail unique educational approach based on specific abilities and requirements. The teachers will be provided useful information about their students' learning abilities, and progress, and deliver suggestions to customize teaching methods [10]. The learners have diverse abilities and unique ways to respond learning opportunities. The institutions face massive challenges in community education system to equitably recognize these differences and develop learning approaches for all learners to achieve satisfactorily. Creating personalized learning situations for each learner we can increase equity by providing every learner what they need to be successful irrespective of language, culture, socio-economic background, competition, ethnicity, physical and mental abilities. Thus there is a need of personalized learning [7].

Personalized learning provides an approach that equitably supports educators' efforts to empower learners as individuals and thus it incorporates differentiation and individualization. Adaptive learning technology can be used with the use of technology and tools to assign digital resources to learners based on their unique needs[11]. The basic components of a personalized learning are represented in the figure 2.The process could include whole-class in small-group activities and learners engaged in digital learning activities with technology used that can measure performance continuously in real time.The use of technology enables the teachers to tailor instruction to provide targeted attention to learners who are struggling. IoT enables the customization of education to give every student access their needs. Collecting data about student performance during lessons as well as tests enables the educators to personalize learning as per their interest as well as capabilities [12]. Artificial intelligence (AI) offers high potential for the application in education. Big data analytics and artificial intelligence can provide personalized learning experiences which in turn help to resolve many challenges [13].It gives teachers the useful information about students' learning abilities and provide suggestions to customize their teaching methods to individual needs[14].

Assistive Technology for Inclusion of students with Disabilities

Inclusion of persons with disabilities has been a challenge always. Certain progress is being made in improving inclusion through policies and technologies. Assistive technology is any device or software that is used to improve the functional capabilities of persons with disabilities like visual impairment, hearing impairment, speech impairments, physical and cognitive impairment etc.[15]. Assistive technology is designed to help students who have learning disabilities and allow them to function within the classroom.

Assistive devices are suitable for students with visual impairment or low vision to assist in effective learning. Software can allow users with visual impairment to read documents on a standard scanner with optical character recognition and read using speech synthesis. Text-to-speech software can help the user in adjusting the volume, pitch and speed of reading [16]. Students with low vision not able read small text mayuse large key labels, special equipment for display adjustment, computer-generated enlarged symbols, text and graphics on the monitor. Modifying the color of the monitor or altering the foreground and background colors can help to enhance access and readability for the students having problem to distinguish colors. An RFID-based assistive device application is the navigation system. Visually impaired people require specialized Human Machine Interface (HMI) to control home-based equipment. Specialized zooming devices allow people with low vision to control the home setting[17].

Assistive devices that are suitable for students with hearing and speech impairments can aid in efficient learning[18]. Advanced speech synthesizers act as alternative tool for students who cannot interconnect vocally. Speech recognition software can change a spoken message into a text document that allows the hearing impaired students to read easily.Deaf or hearing impaired people require specialized HMI touch screens to access graphical information and read text. The assistive devices designed for the hearing impaired aresensors and RFID-based devices [19]. A number of assistive technology devices that helps people with physical and cognitive impairments used for learning disabilities are eye gaze trackers, variable speed recorders, speech synthesizer**,**videotaped social skills, math simulations**, a**bbreviation expanders, OCR, FM listening systems, speech-recognition software and word-prediction platforms [20].

IoT technologies and applications have the potential to help people with disabilities for providing education in a better way and accelerate development of assistive technologies. Education for students with disabilities could be improved through the provision of IoT as the assistive technology.IoT and wearables have enormous potential to help the people with disabilities in learning [21]. The basic structure of an IoT-enabled learning for disabilities is represented in figure 3. Many assistive devices are built using artificial intelligence (AI) technologies, including real time speech-to-text transcription and visual recognition tools. Its use in the education space has the potential to help students with disabilities overcoming disability-related learning challenges making the tertiary learning environment [22].With IoTdevelopment, the advances of brain gate technology and brain-computer interfaces made possible the development of models such as brain-controlled prosthetic devices, keyboards and computer games. BCI

technologies can be transformed into real-world applications such as communication and control, motor substitution and entertainment etc[23,24].The World Wide Web could help address various issues relating to the needs of people with disabilities by providing a universal interface to IoT as it does for the traditional internet referred to as Web of Things (WoT) [25].

The key challenges in Integration of IoETcomprise **s**ecurity, mobility, interoperability, scalability. network bandwidth, web analytics, teacher training and cost etc. The growth of integrating IoT in education is increasing and it will have a great impact in future education. It will have more integration of IoT with AI for efficient personalized learning and helps in development of advanced adaptive assistive tools to address learning challenges for disabilities.

CONCLUSION

The IoT in education helps to develop an efficient e-learning farme work to predict the educational needs of the students from the inter connected objects andenables the customization of education to provide every student access to their needs that can regulate their preparation actively and passively enabling the educators to personalize learning as per their needs and capabilities. Besides this, education for students with disabilities could be improved through the utility of IoT-enabled assistive technology. Its use in the education space has the potential to help students with disabilities by overcoming the disability-related learning challenges and enable for effective inclusive education. IoT technology has opened the door ways for innovative ideas in the field of education through artificial intelligence for improvement both students and teachers. Alongside technology, enhanced IoT-supported educational environment demands a higher degree of research in designing IoT-based intelligent teaching-learning platforms.

ABSTRACT

The present work is an attempt to study the grain biology of selected rice landraces of Southern Odisha to recommend the best varieties suitable for cultivation in different agro climatic zones for which 10 rice landraces cultivated using traditional methods and unique in their morphological characters of shape, size and colour were selected. Most of these rice landraces are grown in pristine habitats by a small group of marginal farmers residing in the tribal belts of Southern Odisha who serve as the custodians for these races. The 10 rice landraces selected for the present study are available in the Jeypore tract of undivided Koraput district and are known by their local names as Tiki chudi, Asamchudi, Baunsidubraj, Deulabhoga, Kanakchudi, Muktabali, Kalamalli, Kandulakathi, Dudhamani and Sapuri respectively. The studies carried out with reference to grain biology include the determination of the percentage of seed germination and seedling establishment, changes in the shoot and root length of seedlings, determination of total biomass in terms of their fresh and dry weights, photosynthetic efficiency and changes in gross photosynthetic and respiration rates. The results of the study indicate an immediate attention to conserve the gene pool for restoring the biodiversity of rice landraces.

Key words: Landraces, custodian, germination, biomass, photosynthetic, biodiversity

INTRODUCTION

Rice (*Oryza sativa* L.) belongs to the family Gramineae. It is one of the major food crops of the world and forms the staple diet for about half of the world's population. Asia is the leader in rice production contributing to about 90% of the world's produce. Over 75% of the world rice produce is consumed by people in Asian countries which makes it an important component for the food security of Asia. Rice has been considered as the queen among cereals for its nutritional quality and higher digestibility and it has played a pivotal role in shaping the cultures, diets, and economies of billions of people. The state of Odisha is known for its unique rice land races. The first collection of 1,745 types of rice landraces was done from a small tract in Jeypore (under undivided Koraput district) representing practically the entire range of genetic variability and it helped in establishing the region as the "Secondary centre of origin of cultivated rice" (Ramiah and Ghosh, 1951; Govindswamy and Krishnamurty, 1958). The tribal farmers adopt age-old cultivation practices and grow a number of traditional rice varieties timed to mature in months matching festive or ritual occasions. The traditional life style of these people has always been insulated from the present modern ways of life and comforts. The rice landraces found in Odisha represent a wide range of genetic variability particularly for more useful characteristics such as growth in various land types (upland, medium land, lowlands etc.), possession of strong aroma, drought tolerance nature, stable yield (without use of chemical fertilizers), weed competitiveness, moderate tolerance to pests/diseases, good eating and cooking quality, higher grain number, suitability for various fast-food preparations etc.

There are three main developmental stages in rice: germination/ vegetative growth, reproductive development and grain ripening and seed germination is an early and crucial stage in the life cycle of rice plants and refers to the physiological processes starting from the uptake of water by the dry seed and ending with the radicle protrusion (Bewley, 1997). It is a complex physiological and biochemical process that involves a series of signal transduction and gene expression regulation. Rice seed germination could determine its seedling growth and yield to some extent. A series of exogenous and endogenous factors contribute in germination regulation, including water, temperature, light, circadian rhythm, and phytohormones (Penfield etal., 2005; Holdsworth et al., 2008). Germination and seedling growth are very important for the early establishment of plants and this in turn directly affects the gross photosynthetic and respiration rates as well as the activity of ATPase.

REVIEW OF LITERATURE

The seed is a miniature plant in a latent state, encompassing all the characteristics of the cultivar to which it belongs. It is the terminal point in the life cycle of the mother plant as well as the starting point in the life cycle of the plant that follows it. The transition of the seed from the resting phase to one of activity is known as germination (Gelmond, 1981). Evenari 1961 defined germination as "the sum total of all the physiological processes occurring inside the seed, which starts with imbibition of water and ends with protrusion of the embryonic root in docots and coleororhiza in monocots." Ching, 1972 defined germination as a stage in the "developmental process from fertilized egg cell to mature plant which is genetically programmed and environmentally modulated." Each developmental phase exhibits a characteristic pattern of metabolism controlled by enzyme activities that differ in kind, rate and location. The rate of enzyme activities are controlled by the quantity of the active enzyme, substrates(s), cofactor(s), coenzyme(s), presence of inhibitors or stimulators, physical and chemical micro-environment including temperature, light, pH, hydration, ionic strength etc.

Seed is the most important part of a plant for continuity of life and race and its protection and preservation is also equally important. Germination is the first important event of plant life. The second important event of plant life after germination is seedling growth in which the new areas of the tiny plant develop and the third important event being seedling establishment where the seedling interacts with the environmental factors and survive. During this process of seedling growth, all necessary constituents of the cell, cell-wall and cell inclusions are synthesized which

are utilized for growth, development and stabilization of the seedlings. These events are also directly or indirectly influenced by various environmental and internal factors. During this stage, the seedlings try to become self-established by developing root and shoot systems. The growth of both root and shoot systems are also controlled by various metabolic activities carried out by leaves. Hence, changes in shoot and root length of the seedlings, their fresh and dry weights, changes in certain macromolecular contents such as chlorophylls, other pigments, biomolecules etc. are considered as important parameters of seedling establishment.

High percentage of seed germination and seedling establishment, disease free seedling and healthy growth of the plant are considered to be some of the noteworthy indications about high yield potential of any crop plant. In nature, as the plants are very much exposed to different environmental changes, insects, pests, they suffer from various types of diseases at different stages of their life cycle. So, the plants cannot maintain a perfect disease free life, unless proper care is being taken. The seeds produced from the disease affected plants cannot be utilized in agriculture or for food purposes because these lack germinating vigour and nutritional value.Though the rice plants are very much susceptible to various types of diseases and the production decreases significantly which is strongly related to the degree of infection still it is considered to be the staple food of almost half of the world's population. In India, more than 37,793,000 hectors of land is under rice cultivation and 75% of Indian population depends upon rice as staple food. The cultivation of this cereal crop is a challenging task for a cultivator because it needs a lot of experience and much care. All phases of its life cycle : i) germination phase, ii) seedling phase, iii) growth and tillering phase, iv) flowering phase, v) fruiting phase and vi) harvesting phase are very much sensitive to pest infection and also to changes in the climatic conditions (Chatterjee and Maiti, 1981). Out of all the phases, the germinating phase needs more attention because it is the basic and most sensitive phase from which the life cycle of the plant starts.

MATERIALS AND METHODOLOGY

Sample Collection

Grains of 10 rice landraces were collected from the tribal farmers of Rayagada, Koraput, Malkangiri, Phulbani districts of the southern part of Odisha during the months of July- August. Sample grains of each variety were stored in self-sealing plastic bags at ambient temperature under moisture free conditions in the laboratory for further studies.

Equipments, Chemicals, Labware and tools

All the chemicals used were of analytical grade and procured from Himedia Pvt Ltd. India, Sigma Aldrich India, Merck Pvt Ltd., India. The glasswares and plastic wares were procured from Borosil Glass Works Ltd., India and Tarsons Products Pvt Ltd. respectively.

Equipments and tools used

Digital Balance (Shimadzu BL220H), Dhona balance, pH meter (Eutech pH tutor), Hot air oven, Incubator (C1-3S), refrigerated centrifuge (Remi C-24B), benchtop centrifuge, vortexer, waterbath shaker (Remi), burril shaker, UV double beam Spectrophotometer (Shimadzu 01482), laminar air flow cabinet, micropipettes (0.5-10µls, 5-50 µls & 200-1000 µls), germinator, Photo-Warburg's apparatus (New Paul, India), Whatman No. 42 filter paper.

Studies relating to germination

Studies on seed germination were performed by sowing the grains of each variety in earthen pots during the month of July. Soil having pH of 8.6 and an ambient temperature of 28-30°C was selected for seed sowing .The success rate of germination was calculated for each of the rice landraces under study after 10 days of sowing. The following tasks were performed following the germination of seeds:

Seedling height

Seedling height was measured at the 5 leaf stage. Height is recorded in cm from the base of the shoot to the tip of the tallest leaf blade (IBPGR-IRRI Rice Advisory Committee, 1980).

Study of seed viability

The seeds were soaked with different concentrations of test solution from 12h to 96h. After scheduled period of exposure, the seeds were washed with tap water, followed by distilled water and the seed viability was tested according to the procedure of (Moore 1969). The result was expressed as percentage of mortality.

Experimental methods of seed treatment

Always 25 no. of grains and 50ml seed dressing solution were utilized for single treatment. Usually the seeds were kept inside the nylon netted cloth and then allowed to dip inside the test solution for desired period of time. After treatment the seeds were taken out and then these were further allowed to dry on a blotting paper at room temperature and in shade condition. During treatment the seed dressing solution was under constant shaking by magnetic stirrer. After treatment the test solution was rejected. The above procedure was repeated according to the need of the number of replicates for a particular type of experiment. The seeds were arranged on the petriplates and enough care was taken to see that the seeds remain in contact with the medium and the seeds do not dip-in the medium. The petriplates were kept in the culture racks and also in the seed germinator (Remi). The medium was never allowed to be dried. The exact amount of water required was supplied in equal quantity to maintain constancy.

Always twenty five seeds were kept in each petriplates and each treatment including control. For germination and growth studies mainly out of two types of treatments, short term treatment was conducted in petriplates both in racks and seed germinator. Thereafter the set was regularly supplied with distilled water at an interval of 12 hours. In all sets, the seeds were allowed to germinate in normal photo inductive cycles (PIC), normal humid atmosphere and at a temperature of $26 + 2^0$ C for 48 hours. After 48 hours of normal soaking and incubation, all seedlings were transferred to growth chambers, culture rack and seed germinator [Remi]. To calculate the percentage of seed germination, periodical observations were made at an interval of 24 hours to 144 hours. First emergence of coleorhizae (Referred as Root) about 2 mm in length was considered as normal germination, so also appearance of coleoptiles (referred to as shoot) before emergence of coleorhizae was considered as abnormal germination. From this pilot test, a range was selected by visual screening and percentage of germination and percentage of seedling establishment was noted. The seeds were allowed to grow in petriplates inside the growth chamber. Visual screening was carried out basing on the growth and the percentage of seed germination and percentage of seedling establishment was also calculated. Care was taken to avoid contamination during the experiments.

Study of seedling growth (Petriplate Culture)

In petriplate culture, the petriplates were cleaned with tap water then with chromic acid and then tap water and finally with double distilled water and dried in an oven. Twenty five pre soaked seeds were sown in petriplates at uniform distance in all the sets. All the petriplates were kept at room temperature and normal photo-inductive cycle was maintained by providing light from fluorescent tubes in day time. On each 7^{th} day of exposure, seedlings were harvested for respective experimental analysis.

Study of Morphological Parameters

Shoot length and Root length

From each replicate 10 seedlings were selected randomly and shoot and root lengths were measured, with the help of a scale.

Shoot Weight and Root Weight

Ten seedlings from each replicate were taken. The shoots were separated from the roots. These were washed thoroughly with distilled water, surface dried by means of blotting paper. Then fresh weights of roots and shoots were taken separately by a single pan electrical balance (Dhona). The weighed shoots and roots were kept in an oven for 48 hours at a temperature of 80^0C and their dry weights were recorded at 24h interval till we get a constant weight of the samples.

Percentage of moisture content

Percentage of moisture content was calculated as follows:

$$\text{Percentage of moisture content} = \frac{W_1 - W_2}{W_1} \times 100$$

Where, W_1 = Fresh weight; W_2 = Dry weight

Photosynthetic efficiency

Pigment studies

To study the pigments (total chlorophyll, total phaeophytin and carotenoid content) the pigment was extracted in 10 ml of cold 80% acetone with a pre-chilled micro-tissue homogenizer of the shoot tissue, centrifuged at 8000rpm for 10 minutes and the supernatant was taken and the extinction values at 475, 649 and 665nm were recorded to estimate total carotenoid and total chlorophyll, respectively. From the above supernatant, 5 ml was pipetted into a stoppered test tube, a pinch of oxalic acid was added, shaken thoroughly and was kept in a refrigerator overnight for estimation of phaeophytin. The total phaeophytin was measured by recording the extinction values of the extract at 655 and 666 nm. The amount of total chlorophyll and total phaeophytin was calculated by using the formula given by Vernon (1960). The amount of carotenoid was calculated by using the formula given by Davies (1976).

Total chlorophyll (mg l^{-1}) = (6.45 x OD at 665 nm) + (17.22 x OD at 649 nm)

Total phaeophytin (mg l^{-1}) = (6.75 x OD at 666 nm) + (26.03 x OD at 655 nm)

$$\text{Carotenoid content (mg } l^{-1}) = \frac{D\ V\ K}{2500 \times 100}$$

Where, D = Optical density at 475 nm;

V = Volume of the extract,

K = Dilution factor;

2500 = Specific extinction coefficient at 475 nm

Oxygen evolution and consumption measurements

The evolution of oxygen due to photosynthesis and consumption of O_2 in respiration were measured manometrically with the help of a Photo-Warburg's apparatus (New Paul, India) following the procedure of Hannan and Patouillet, 1972 and Oser, 1965. Rate of photosynthesis was expressed in µl of O_2 evolved hr^{-1} g^{-1} of the seedling and respiration rate was expressed in µl of O_2 consumed hr^{-1} g^{-1} of leaves of the seedling. The GPP (Gross Primary Production) and NPP (Net Primary Production) values were calculated from the values obtained from both the oxygen evolution and oxygen consumption studies. The above studies were conducted for 144hr old seedlings in petriplate culture.

The freshly weighed plant tissue was suspended inside the Warburg's flask with 0.25 ml of sucrose solution (0.25 M) and base medium. The central well of the Warburg's flask contain a wick Whatman filter paper soaked in 10% KOH solution to absorb carbon dioxide produced during the experiment. Triplicate manometers were used simultaneously

with adequate thermo-barometers for necessary corrections. The flasks were acclimatized with the temperature and light intensity for 15 minutes with normal shaking (74-78 strokes / minute) of the apparatus. Then the oxygen evolution was recorded after air tightening the Warburg's flask with normal shaking. The filter paper wick was removed and the entire KOH was soaked. The flask was air-tightened and the Warburg flask was again acclimatized for 15 mins after light was flooded (2200+200Lux).The evolution of oxygen was therefore recoded by the change indicated in the closed arm of the manometer. The readings were multiplied by flask constant and other factors (Sahu, 1987) (a factor, determined earlier for each Warburg flask). Rate of photosynthesis was expressed in µl of CO_2 consumed/ sample (rice seedlings) / hr and respiration rate was expressed in µl of CO_2 produced / sample of seedling / hr.

ATPase activity, extraction and assay

The plant material was grounded with 10 ml of 0.1 M Tris-HCl buffer (pH 7.4) in pre-chilled micro-tissue homogenizer and the crude homogenate was centrifuged at 4°C and 10,000 rpm for 20 minutes. The supernatant was used as the sources of enzyme. The assay mixture consisted 2 ml of 0.1 M Tris-HCl buffer (pH- 7.4), 1 ml of $MgCl_2$ (20 m mol), 1 ml of ATP solution in buffer (1 m mol/ ml) and 1 ml of enzyme extract. The assay mixture was incubated at 37°C for 30 minutes and the reaction was stopped by adding 1 ml of 20% perchloric acid. A zero time control was run at the same time with the enzyme extract added after perchloric acid to the assay mixture. The assay mixture were then kept in a refrigerator for 30 minutes and centrifuged. An aliquot of the supernatant was taken for estimation of inorganic phosphate by Molybdenum blue method (Martineck, 1970). Colour development proceeds at room temperature for 30 minutes and the extinction was measured at 600 nm by a digital spectrophotometer (UV-Visible Spectrophotometer, PC based, Systronics, 119). The amount of inorganic phosphate was calculated from a standard graph prepared by a graded series of known concentrations of Potassium dihydrogen phosphate (KH_2PO_4). Activity of ATPase was expressed as mg of inorganic phosphate (Pi) liberated / hr /100 mg dry weight of the leaf tissue. All the experiments were performed in triplicates and repeated thrice. The observed results were statistically analysed to test the level of significance and validity of the data.

The germination success rate of the selected varieties varied between 81.8- 100%. Varieties Kanakchudi, Muktabali, Kalamalli, Kandulakathi, Dudhamani and Sapuri showed 100% germination whereas 81.8% germination was found withS the varieties Asamchudi, Baunsidubraj and Deulabhoga. The variety Tikichudi showed 90.9% success rate. All the selected varieties showed dwarf habit. The height increase per day was also calculated for each of the selected varieties and the values ranged between 0.93- 2.11. Table 1 and Fig 4 Showed the changes in percentage of seed germination and seedling establishment, root and shoot length and lateral roots in 10 varieties of rice seedlings after 144hrs of exposure. Out of 10 varieties tested varieties V2-Asamchudi and V5- Kanakchudi showed 100% germination and 100% seedling establishment when compared to rest 8 varieties of rice. Tikichudi, Kalamalli and Sapuri showed 80% germination and 80% seedling establishment was recorded in Kalamalli but in case of Tikichudi and Sapuri, 70% seedling establishment was recorded (Fig.12). Deulabhoga seeds showed 45% germination and 30% seedling establishment which is not statistically significant. Baunsidubraj, Muktabali and Dudhamani showed 35%, 28%, 15% germination and 12%, 11%, 07% seedling establishment, respectively. These values are far less significant (Fig. 4 and Table 2).

Table 2 showed very interesting results pertaining to lateral roots. In case of Deulabhoga, the root length was 9.2cms whereas in the rest of the varieties, the root length was less when compared to Deulabhoga. The least number of lateral roots were found in Dudhamani, Muktabali and Deulabhoga. In case of Kanakchudi and Tikichudi maximum number of lateral roots were observed as it is good sign for this monocot plant (Table-22 and Fig. 13). Longest shoot length was recorded in case of Asamchudi, Deulabhoga and Kanakchudi and least shoot length was recorded in case of Dudhamani. The rest of the varieties showed stunted growth. It seems varieties like Tikichudi, Baunsidubaraj, Muktabali, Kalamalli, Kandulakathi and Sapuri showed growth but not like the same as these varieties showed at

Koraput district. It seems these varieties are not responding well to laboratory controlled conditions. It seems the climatic conditions of Koraput district play a crucial role due to which all these varieties respond well to Koraput climate rather than Ganjam or Bhanjabihar climate. The least number of lateral roots in Dudhamani, Muktaballi and Deulabhoga indicated the least growth and production both vegetative and reproductive indicating least grain production. These three varieties are considered to be the least productive among the 10 varieties tested which warrants attention (Table 2). From root and shoot length measurements, it can be inferred that the varieties like Asamchudi, Tikichudi, Kalamalli, Sapuri, Deulabhoga and Kandulakathi may be considered as the best for cultivation when compared to the rest of the varieties (Fig 5 and Table 2).

Table 2 and Figures 6 and 7 showed the changes in root and shoot fresh weight and dry weight of 10 varieties of rice seedlings after 144hrs of exposure. Varieties such as Deulabhoga, Muktabali and Dudhamani showed the lowest fresh and dry weight in roots and shoots of 144hr old seedlings. Asamchudi, Kanakchudi and Kandulakath showed the highest biomasss when compared to rest of the varieties. The variation in weight was probably due to the high photosynthetic potential of the varieties and may be these varieties showed best adoptive features to the present environmental conditions available in the laboratory. Table-2 indicated the moisture content of the 144hr old seedlings. The observations were mostly as expected. Baunsidubraj, Muktabali and Dudhamani showed the lowest moisture content in the seedlings. Moisture content of the seedlings plays a crucial role for the plant growth and development. The survival of the seedlings depends mostly on the moisture content of the seedlings and all metabolic processes are directly related to the water content available in the seedlings (Fig. 16). In low water level, a shunted growth is expected. The depletion in metabolic activity can be linked to moisture content and also in seed biological studies moisture plays an important role during germination.

As sufficient water was available in the experimental plates, deficit of water is not the limiting factor. It may be because of low imbibition rates of the seeds which affected the mobilization of biochemicals at the time of germination and seedling growth that lead to decrease in growth and shunted growth of the seedlings. The differential behaviour of the seeds can also be correlated to storing conditions, use of seed dressing chemicals, age of the seeds. Some of the seeds might have lost their viability and vigour during holding time. However, few seeds germinating in a particular condition and other seeds do not germinate in those conditions probably indicate the mixture of seeds belonging to different viability groups.

Figure 7 related to dry weight analysis followed the same trend like that of figure 6 related to fresh weight of the seedlings as expected. Fig.16 indicated the changes in moisture content in root and shoot of 144hr old seedlings of 10 different varieties of rice seeds / grains conducted under laboratory controlled conditions. The following varieties showed the highest moisture content: Sapuri-84.8%, Kanakchudi- 83.6%, Kandulakathi- 83.3%, Asamchudi-82.8% and the rest of the varieties showed significantly less moisture content in the 144hr old seedlings. Baunsidubraj, Muktabali and Dudhamani showed the lowest moisture content when compared to the rest of the varieties. This low water content probably harmed the survivability of the seedlings. As described earlier the moisture content plays a key role in early phases of germination of the seeds and the seedling growth depends upon the moisture content.Table 4 and figure 9 Showed the changes in gross photosynthetic rate in 144hr old seedlings in 10 varieties of rice seedlings after 144hrs of exposure. Asamchudi showed 248.4±15.6µl of O_2 evolved g.-1 hr.-1, Kanakchudi showed 239.7±14.1µl of O_2 evolved g.-1 hr.-1, Tikichudi showed 231.9±11.5µl of O_2 evolved g.-1 hr.-1 and Deulabhoga showed 221.5±17.3µl of O_2 evolved g.-1 hr.-1 gross primary production or photosynthetic rate in 144hr old seedlings. In rest of the varieties the photosynthetic rate was significantly less. The least photosynthetic rate was marked in case of Dudhamani variety 157.6±11.3µl of O_2 evolved g.-1 hr-1. Significantly low values of photosynthetic rate were also observed in Muktabali and Baunsidubraj where the values were 169.4±16.3µl of O_2 evolved g.-1 hr-1and 162.7±11.8µl of O_2 evolved $g^{-1} hr^{-1}$ (figure 9 and table 4).

Table 4 and figure 9 Showed the changes in respiration rate in 144hr old seedlings in 10 varieties of rice seedlings after 144hrs of exposure. Asamchudi showed 236.6±11.4µl of CO_2 evolved g^{-1} hr^{-1}, Kanakchudi variety showed 214.5±13.2µl of CO_2 evolved g.-1 hr.-1, Tikichudi variety showed 228.7±9.8µl of CO_2 evolved g.-1 hr.-1 and Deulabhoga showed 201.5±12.4µl of CO_2 evolved g^{-1} hr^{-1} respiration rate in 144hr old seedlings. In rest of the varieties, the respiration rate was significantly less. The least respiration rate was marked in case of Baunsidubraj variety 148.3±6.5µl of CO_2 evolved g^{-1} hr^{-1}. Significantly low values of respiration rate was observed in Muktabali and Dudhamani where the values were 165.8±19.4µl of CO_2 evolved g^{-1} $hr^{-1}$and 151.3±9.3µl of CO_2 evolved g^{-1} hr^{-1} respectively (Fig. 9 and Table 4).

Table 4 and figure 10 showed the changes in ATPase activity in 144hr old seedlings in 10 varieties of rice seedlings after 144hrs of exposure. Kanakchudi showed 4.24±0.37µg of ip liberated/ hr/ 100mg dry wt., Asamchudi showed 4.14±0.43µg of ip liberated/ hr/ 100mg dry wt., Sapuri showed 4.09±0.61µg of ip liberated/ hr/ 100mg dry wt., Tikichudi variety showed 3.82±0.54µg of ip liberated / hr / 100mg dry weight and Deulabhoga showed 3.5±0.56µg of ip liberated / hr / 100mg dry weight ATPase activity in 144hr old seedlings in the descending order. In rest of the varieties the ATPase activity was significantly less. The least ATPase activity was observed in case of Dudhamani which was 2.25±0.24µg of ip liberated/ hr/ 100mg dry weight. Significantly low values of ATPase activity was observed in Muktabali and Baunsidubraj where the values were 2.47±0.53µg of ip liberated/ hr/ 100mg dry wt. and 2.63±0.61µg of ip liberated / hr / 100mg dry wt. (Fig. 10 and Table 4).

Table 5 and Fig. 11 showed the changes in chlorophyll content in 144hr old seedlings in 10 varieties of rice seedlings after 144hrs of exposure. Kanakchudi showed 1.996 mg of chlorophyll/ liter, Asamchudi showed 1.992 mg of chlorophyll/ liter, Sapuri showed 1.935 mg of chlorophyll/ liter, Tikichudi showed 1.981 mg of chlorophyll / liter, Kalamalli showed 1.974 mg of chlorophyll / liter, Kandulakathi 1.965 mg of chlorophyll / liter and Deulabhoga showed 1.714 mg of chlorophyll / liter in 144hr old seedlings in the descending order. In rest of the varieties the chlorophyll content was significantly less. The least chlorophyll content was marked in case of Dudhamani which was 1.588 mg of chlorophyll/ liter. Significantly lower values of chlorophyll content was observed in Muktabali and Baunsidubraj in which 1.622 mg of chlorophyll/ liter and 1.658 mg of chlorophyll/ liter was found respectively (Fig. 11 and Table 5).

Table 5 and Fig.11 showed the changes in phaeophytin content in 144hr old seedlings in 10 varieties after 144hrs of exposure. Asamchudi showed 1.346 mg of phaeophytin/ litre , Kanakchudi showed 1.342 mg of phaeophytin/ litre, Sapuri showed 1.302 mg of phaeophytin /litre, Tikichudi showed 1.311 mg of phaeophytin /litre , Kalamalli showed 1.322 mg of phaeophytin /litre, Kandulakathi 1.105 mg of phaeophytin / liter and Deulabhoga showed 1.101 mg of phaeophytin / liter in 144hr old seedlings in the descending order. In rest of the varieties the phaeophytin content was significantly less. The least phaeophytin content was found in case of Dudhamani which was 1.009 mg of phaeophytin / liter. Significantly low values phaeophytin content was marked in Muktabali and Baunsidubraj where the values were 1.114 mg of phaeophytin/ liter and 1.066 mg of phaeophytin/ liter respectively (Fig. 13 and Table 5). Table 5 and Fig.13 showed the changes in carotenoid content in 144hr old seedlings in 10 varieties of rice seedlings after 144hrs of exposure. Kanakchudi showed 0.000386mg of carotene/ liter, Asamchudi showed 0.000384mg of caroterne / liter, Tikichudi showed 0.000381 mg of carotene/ liter, Kalamalli showed 0.000378mg of carotene/ liter, Sapuri showed 0.000376mg of carotene / liter, Kandulakathi 0.000269 mg of carotene / liter and Muktabali showed 0.000274 mg of carotene / liter in 144hr old seedlings in the descending order. In rest of the varieties the carotene content was significantly less. The least carotene content was marked in case of Dudhamani which was 0.000198 mg of carotene/ liter. Significantly lower values of carotene were found in Deulabhoga and Baunsidubraj which were 0.000262 mg of carotene/ liter and 0.000245 mg of carotene/ liter respectively (Fig.12 sand Table 5).

The differences in chlorophyll content is linked to photosynthesis and gross production and a higher chlorophyll level will indicate higher production and lower chlorophyll level indicates stress. Padhy (2006) clearly opined that different climatic factors have major impact on the chlorophyll content, rate of photosynthesis and production.

CONCLUSION

Out of the ten varieties tested for the seed biological studies, it was evident that the six varieties like Kanakchudi, Asamchudi, Tikichudi, Kalamalli, Sapuri and Kandulakathi were the best varieties which can be cultivated in all agroclimatic conditions. Dudhamani variety can only be grown in Koraput district and this variety will not suit to all agroclimatic conditions. The present study at base level in seed biology will only indicate the status of the system under study. Detailed biochemical and enzymatic analysis of all the available varieties can give us some interesting information regarding the variation in the biological characteristics of the varieties. In addition, molecular profiling and sequencing data using the tools of biotechnology can hint at the phylogenetic relationships among the studied rice landraces. Further the biochemical and nutritional evaluation of the studied races would pave ways for the successful exploitation of these rice landraces in food fortification processes to combat elemental and nutritional deficiencies and the results of the study would also provide a means for the conservation of these neglected races.

ACKNOWLEDGEMENTS

The authors are highly thankful to the Head, department of Botany, Berhampur University for providing the necessary lab facilities for carrying out the work. The authors would also remain indebted to the management of Centurion University of Technology and Management, Paralakhemundi for their encouragement to take up such a study.

ABSTRACT

Procurement management plays a pivotal role in the successful execution of the project in the construction industry. On the other hand, procurement management has continued to pose significant obstacles to the building projects' progress and profitability due to Covid-19. Studies have shown that materials account for 60 percent of the total cost of the project, which clearly specifies that if any delays or mishandling occur during the procurement process; the project schedule will be affected, thus increasing the cost and time. This study attempts to identify the distinct phases of procurement management and to analyze Covid-19 attributable empirical study on the impact of the Procurement Management Process in construction projects. The project recommends key procurement areas including certain quantity of materials, designed to set standards and specifications for the materials to be procured, preparing the scope of the procurement work by the influence of Covid-19, drafting up a report on the suppliers to enhance their effectiveness, giving adequate technical and financial coordination with the suppliers to overcome the financial crisis.

Keywords: Covid-19, Empirical study, Procurement Management

INTRODUCTION

Construction projects are extremely complex and often take place in an uncontrolled, unprepared, and dynamic environment where each project is completed through several phases. Modern construction management therefore requires real-time and accurate information to be shared between all parties involved in order to carry out efficient and effective planning, as well as execution, Equipment, equipment, manpower, and resources needed to construct and execute a project. Building material contributes around 60 per cent of the overall construction value. That demonstrates how important procurement is to manage the project. Materials management is an essential function

which enhances productivity in construction projects. There is hardly any place in today's globalized world that has been left untouched by the magnitude of the Novel Corona virus or the Covid-19 pandemic. At the hands of the cruel Covid-19 almost every commercial operation is suffering. Due to the intrinsic nature of business practice, some industries may inadvertently prosper under the pandemic, while others may weather the storm. The construction and engineering sector is definitely at the wrong end of the curve, albeit with a great deal of difficulty but of the hardest affected. Efficient planning of materials procurement and storage on construction sites can lead to significant improvements in construction productivity and project profitability. Overlooking these critical interdependencies between material procurement and site-space availability can lead to serious project problems including material shortages, improper storage, poor and unsafe site layout, and productivity losses in the lockdown time. Hence, the efficient use of material has an important influence on a company's profit and can avoid delay in construction.

METHODOLOGY

The research was focused on examination of the literature, study of past documents, general interview between workers, various types of surveys and the analysis of sources of knowledge. The case study focused on building construction projects from which detailed about the procurement process of materials could be collected in the Covid-19 period. With the aid of different literature case studies and analysis of procurement management measures involved in the usual building constructions at different areas, the major problems involved in the material management processes carried out through the projects have been identified. Through this methodological approach, the different phases of this project should be clearly distinguished and the processes involved in material management have been continuously observed without failure and the root causes can be determined. The experimental analysis consists of theories and concept consideration in practice. Therefore, the present work involved in the construction site was classified as follows. Analysis of site and management, analysis of inventory controlling, analysis of purchasing procedures, analysis on procurement and tracking cost analysis. The construction and engineering sector, already facing multiple challenges, ranging from lack of capital and credit avenues to insolvencies, multiple fraud and regulatory burden under the Environmental Laws and Real Estate (Regulation and Development) Act, 2016, is now marred by the Covid-19 pandemic, with no probable relief in view. The study allowed collecting the basic data of the projects related to procurement process, approvals, purchase reports, claim reports and supply reports. From the information gathered improved strategies were obtained and a proper strategic approach to the material procurement management process was proposed for the building projects in this lockdown period.

Material Procurement

To analyze the stages in which maximum irregularities occur in the procurement process and the factors in the procurement process leading to high costs. To study the setup of the organization and factors of the site affecting the planning of the procurement in construction projects. The Objectives of material procurement are characterized by buying the best item at the right price, quantity, time and cost. The efficient as buying the best item at right Quality, Quantity, Time and Cost. The efficient material management system can bring many advantages for a company, such as reducing the overall cost of materials, improving material handling, reducing duplicate orders, materials on site when necessary and in the right quantities and improving the labor productivity, Improvements in project schedule, Quality control, Better field material control, Better relations with suppliers, Reduce of materials surplus, Reduce storage of materials on site, Labor-saving, Stock reduction, Purchase savings and Better cash flow management. This project helps to identify the gap between the procurement process and on-site use of the material at the construction stage and suggest appropriate methods and management to ensure the efficient procurement process for high quality construction projects with significantly reduced time and cost

A. Procurement Cycle

Steps to be followed in Procurement Management are:

- Requirement identification.
- Quantification of appropriate elements and preparation of requirements of procurement.
- Ensuring internal requisition and processing.
- Demanding quotes (or) for proposals.
- Assessment of propositions.
- Contract award to supplier.
- Procurement and purchasing process.
- Material delivery and inspection.
- On-site storage and handling prior to dressing.
- Return surplus stock products.

***B.* Planning**

Bill of quantities prepared by the clients in the most commonly used basis for planning things out for the project. Companies can have two main planning stages – micro and macro. The four major types of planning undertaken at sites are time, cost, material and labor. The preparation will be updated as much as possible to track whether work is processing as expected.

***C.* Purchasing**

Procedure to purchase can be described as:
Step 1 – Indent Content
Step 2 – Vendor inquiry
Step 3 –Comparison of Vendor
Step 4 – Vendor Selection and Negotiations
Step 5 – Order to purchase
Step 6 – Vendor Assessment

***D.* Ordering System**

Which materials, quantity, volume and location or distance to the site are the main problems with regard to ordering and this information will be clarified from contract documents such as the quantity bill

1. Synchronized system
2. Prescheduled ordering system
3. Periodic ordering system
4. Non-periodic ordering system

Large components such as air conditioning system, steel work, called synchronized system are ordered. The next step is large volume material like panels and a door called prescheduled ordering system; these are not as big as the synchronized system. Such materials as cement, gravel, called periodic ordering system that is required at different project stage. The small volume and large quantity are called non-periodic ordering system, such as nails and bolts.

***E.* Receiving System**

Receipt system can be divided into receipts from suppliers outside, receipts from suppliers inside. Even before the material reaches the site the receipt system starts. The three documents to be dispatched are the purchase order copy, the consulting document for suppliers and the resale note.

F. **Inspection**

Inspection can occur in two ways that is on site inspection and pre- dispatch inspection. It is the inspector's responsibility to inspect all materials delivered to the site before they are used in the work

Methods of Inspection

There are three methods of inspection:

1. Statistical
2. Visual
3. Tactile

G. **Stacking and storage**

The types of physical on-site storage system differ with the availability of space and client activities. Industrial guidelines for the loading and storage of particular materials are also considered.

Procurement management issues

A. The current faults in the Procurement management system are:

- Decision making delays and award of tender.
- Orders not done on time.
- Materials which do not match the purchase order.
- Delay in arrival of material.
- Importance of quality and the best product or service is not being realized due to lack of knowledge / improved technology.
- Excess procurement of the products and materials.
- Training shortage and ineffective management.
- Lack of communication and relationship between suppliers and contractor.

Some common problems at construction site are:

- Failure due to a timely order delaying in the project.
- Distribution which interrupts the schedule of work at the wrong time.
- False materials or mistakes in the direction of materials which require work.

B. **Delivery of Material**

Delivery of material can be divided into the following parts;

1. Issues concerning departments which consume
2. Issues for manufacturing with outside suppliers

In the case of all construction materials, on-site emitting does not occur. In case of sand or aggregate the materials are consumed according to the progress of the project as and when required. Issues are based on production program for other materials. Work order are printed based on this and the bill of materials, listing for each material. The quantity to be issued against each component requiring that material. That will control consumption automatically.

Procurement management processes

Procurement management includes the necessary processes from outside the project team to purchase or acquire products, services or outcomes needed. Project Procurement Management includes the contract management and change control processes required by authorized project team members to develop and administer contracts or purchase orders issued. Project procurement management also includes the administration of any contract issued by an external organization acquires the project from the executing organization.

a) **Procurement Plan** — This is the method of documenting a project purchase decisions, setting out the approach and identifying new sellers.

b) **Procurement Conduction** —This is the method of receiving answers from the vendor, choosing a supplier and

awarding a contract.

c) **Procurement Administer** — This is the process of overseeing, tracking contract performance, contract relationships and making adjustments and corrections where necessary

d) **Close Procurement** — This is the closure process for every procurement project.

A. Study and Analysis

The study was carried out through literature study, Questionnaire survey and virtual site case study.

B. Case Study

The case study was carried out in Major Construction Companies around Southern part of India during the Covid-19 period. Based on the detail study on case studies, factors affecting the material procurement are identified. They factors are mentioned below.

- Poor project preparation and scheduling culminated in late acquisitions.
- Delays in customer's approval of materials ended in late procurement.
- Delays in the issuance of PO (Purchase Orders) resulted in late material delivery.
- Lack of lead time to late procurement and delivery of the products.
- Poor quality of material involved in the construction site and damaged materials.
- Wrong information about the suppliers may leads to delay in the material procurement
- Current price variance causes major difference in the purchasing of materials.
- The performance of the contractual obligations is necessary or unconstitutional due to a change of circumstances beyond the control of the parties after the contract has been executed.

C. Questionnaire Survey

The Questionnaire Survey carried out with minimum fifteen members including project managers, procurement managers, contractors and consultants in each company. Data obtained from the survey were analyzed using simple percentages and Relative importance Index (RII) method

RII = ΣW÷A×N

W= the weight assigned to each strategy by the respondents A = Highest weight

N = the total number of respondents

Factors affecting Material Management are rated as

Strongly Agree (4), Agree (3), Disagree (2) and Strongly

Disagree (1).

RESULT AND CONCLUSION

Based on the on-site problems due to improper material procurement management, each problem was categorized and a cause-effect diagram was created, where factors such as consultant factors, customer, contractor, inventory, procurement, material, external factors were all addressed in general during this Covid-19 period. The various factors affecting material procurement management are listed as Contractor Contributed Factors, Owner Contributed Factors, Consultant Contributed Factors, Material Contributed Factors and External Factors. Fig 6.1 Factors affecting Material Management Nearly fifty questions were prepared and from the answers thus obtained from them were categorized into each class of problems. In this the major factors affecting the material Procurement as the first three ranks are listed below.

A)Software used for Material Management

Construction materials management software will help efficiently to produce and track purchase orders and requisitions, manage materials and back orders, and export price and cost data to multiple systems Figure. 6.2 shows 90.6% of the Organizations uses the software called BUILD SUPER FAST (BSF**)** for material management 90.6% of the organizations used MIS-MANAGEMENT INFORMATION.

B)Top Factors affecting Procurement Management

C)Cost Considered in Material Planning

The term inventory implies the cost of materials in stock at a given time. Inventory could be of raw materials, construction finishes material, tools and spares, etc**.,** there are various costs associated with Inventory Management which effects on overall process of materials management. They are purchase cost, ordering cost, carrying cost and stock out cost. A balanced inventory acts as a cushion between supply and site requirement till supplies are received. Figure. 3 shows the knowledge of considering the cost in material planning. 91% of the survey results show that most of the organizations considered all the cost involved while planning materials and only 3% of the organizations don't have knowledge about the cost involved in material planning

D)Solution

The various factors affecting the Material procurement management after the lockdown period are to be solved by the following process.

1) Late procurement of materials

a) Improper scheduling

- Wrong Material specification/quantity
- Mistakes in the schedule
- Mainly the lead time is not properly calculated

b) Lack of planning and scheduling

- Material procured without planning
- Schedule is not planned before starting the project

c) The late procurement to be avoided by the following process

- Mainly Lead time consideration for scheduling
- Plan and schedule the Materials before start the project
- Correct Material Specification and Quantity

2) Delay in approval

- Delay in approving major changes in the scope of work by Client.
- Delay in material approval by Architect
- Delay in material approval by consultants

3) Unclear and inadequate details in drawings

- Delays in updating the drawings
- Lack of details in the drawings
- Errors in the Drawings
- Drawings(Architectural, Structural, interior designs)

a) The Unclear and inadequate details in drawings to be avoided by the following process such as

- Proper coordinated drawings for services
- Advanced technology implementation
- Proper Inspection and detailed study of Drawings
- Proper update of drawing revisions
- Proper filing system of drawings
- BIM used for material applications (Clash detection, Material Specifications, revisions quantity)

ABSTRACT

An implementation of Artificial-Neural-Network (ANN) based speech recognition system is explored in this thesis. The fast Fourier transform (FFT) is an important operation in speech recognition, in which a great number of outing-point arithmetic operations are performed. In this thesis, we use Integer FFT to replace the Floating FFT so that the speed of speech recognition is enhanced without including the recognition rate. This uses the Hidden Markov Model (HMM) algorithm to construct speech recognition platform which causes that the speech recognition.

Keywords: ANN, HMM, FFT.

INTRODUCTION

The speech production system generates Speech signals, from our idea of understanding of signals and systems, the system characteristics depend on the design of the system. The case of the system which is linear time invariant, which is characterized in terms of its impulse response characteristics, depending on the type of input excitation the nature of response is depends to the system. For a given system to which we will use different signals like impulse response, step response, sinusoidal response etc. each of these output responses are used to understand the behaviour of the system under different conditions. In the production of speech signal the similarly phenomenon happens in which, the speech production can be broadly classified into three activities which is depending on the input excitation phenomenon. The first case where the input excitation is nearly periodic in nature, the second case where the input excitation is random noise-like in nature and third case where there is no excitation to the system. Accordingly, the speech signal can be broadly categorized into three regions. The study of these regions is the aim of this experiment.

ANN Method

The ANN is formed by connecting millions of biological neurons which are connected to each other like computer network architecture. As we biological neural network consists of dendrites, soma, nucleus, axon similarly artificial

neuron network consist of inputs, summing junction, activation function. The main objective of Artificial Neural Network is to develop a system which will perform complex task very fast then a normal traditional system with good accuracy. Each of the input and output are called nodes which are used for communication between nodes to get meaning full output.BNN can be compared with ANN as soma is as node, Dendrites are as inputs, Synapse as weights or inter connection and Axon are as outputs.

The net input is calculated by

$Y_{in}=X_1W_1+ X_2W_2+ X_3W_3+.....+ X_mW_m$

i.e$Y_{in}=\sum_1^m X_iW_i$

Where X_1, X_2 ... X_m are input signals and W_1, W_2..... W_m are strength of synapse which are connected to input signals to neuron. The neurons are the processing unit which will calculates the weighted sum of the input.

MFCC

The 5th processing step is the Mel frequency spectrum. Where the Mel frequency spectrum is filtered with different band pass filters and the power of each spectral band weight calculated or computed. The computed filter banks applying to angular filters. The main scale aims to mimic the normal human ear perception bye low frequency discriminative and is at higher frequency is less discriminative. We can convert frequency and Mel spectrum (m) using the below equations

$m=2595\log_{10}(1+ (f/700))$

$f=700(10^{(m/2595)}-1)$

Windowing

In signal processing the window function plays an important role. It is also called as function where zero valued outside of the interval normally symmetric around the middle bandwidth. In this process the waveform of the speech signal is multiplied with window function (hamming function). The modelling is done by multiplying buy one inside the window and outside the window.

Frame Blocking Windowing

The speech signal is divided into a sequence of frames where each frame can be analyzed independently and represented by a single feature vector. Since each frame is supposed to have stationary behaviour, a compromise, in order to make the frame blocking, is to use a 20-25 ms window applied at 10 ms intervals (frame rate of 100 frames/s and overlap.) In order to reduce the discontinuities of the speech signal at the edges of each frame, a tapered window is applied to each one. The most common used window is Hamming window, described as below

CONCLUSION

From the presented work, it is concluded that neural networks can be very powerful models for the classification of speech signals. Some types of very simplified models can recognize the small set of words. The performance of the neural networks is being impacted largely by the pre- processing technique. On the other hand, it is observed that Mel Frequency Cestrum Coefficients are very reliable tool for the pre-processing stage. Very good results are provided by these coefficient

ABSTRACT

Big Data is term for datasets that are so large or complex that the traditional data processing application software is inadequate. The use of Big Data has widely spread during the recent times. All the multimillion companies has started implementing methods to make the best use of it. Big Data has its own share of challenges to be dealt with. As the data is really large the retrieving of useful information and classifying the data is a huge challenge.The software experts strived hard in developing the algorithms for classifying and retrieving the data required. The retrieving is dependent on queries produced by the user.

Keywords: Big Data, Data sets, Classification

AIM

The aim of our paper is the software experts strived hard in developing the algorithms for classifying and retrieving the data required. The retrieving is dependent on queries produced by the user. In our project we implement a classification algorithm called KNN (K Nearest Neighbors) that classifies the data and gives a map of the nearest neighbors.

History

Big data is a term for data sets that are so large or complex that traditional data processing application software is inadequate to deal with them. Challenge includes capture, storage, analysis, data curation, and search, sharing, transfer, visualization, querying, updating and information privacy. The term "Big Data" often refers simply to the use of predictive analysis, user behaviour analytics, or certain other advanced data analytical methods that extract value from data, and seldom to a particular size of the data set. There is little doubt that the quantities of data now available are indeed large, but that's not the most relevant characteristic of this new data ecosystem. Analysis of data sets can find new correlations to "spot business trends, prevent diseases, and combat crime. Scientists, business

executives, practitioners of medicines, advertising and governments alike regularly meet difficulties with large data sets in areas including internet search, finance, urban informatics and business informatics.

Description

Data sets grow rapidly – in part because they are increasingly gathered by information-sensing mobile devices, aeriel (remote sensing), software logs, cameras, microphones, Radio Frequency Indentification (RFID) readers and wireless sensor networks. The world's technological per-capita capacity to store information has roughly doubled every 40 months since the 1980s; as of 2012, every day 2.5 extrabytes (2.5×10^{18}) of data are generated. One question for large enterprises is determining who should own big-data initiatives that affect the entire organization. Relational database management systems and desktop statistics- and visualization-packages often have difficulty handling big data. The work may require "massively parallel software running on tens, hundreds, or even thousands of servers". What counts as "big data" varies depending on the capabilities of the users and their tools, and expanding capabilities make big data a moving target. "For some organizations, facing hundreds of gigabytes of data for the first time may trigger a need to reconsider data management options. For others, it may take tens or hundreds of terabytes before data size becomes a significant consideration."

Motivation

The computing revolution that began more than two decades ago has led to large amounts of digital data being amassed by corporations. Advances in digital sensors; proliferation of communication systems, especially mobile platforms and devices; massive scale logging of system events; and rapid movement toward paperless organizations have led to a massive collection of data resources within organizations. And the increasing dependence of businesses on technology ensures that the data will continue to grow at an even faster rate.

Purpose

The concept of Big Data has been around for more than a decade – but while it is potential to transform the effectiveness, efficiency, and profitability of virtually any enterprise has been well documented, the means to effectively leverage Big Data and realize its promised benefits still eludes some organizations. Ultimately, there are two main hurdles to tackle when it comes to realizing these benefits. The first is realizing that the real purpose of leveraging Big Data is to take action – to make more accurate decisions and to do so quickly. We call this situational awareness. Regardless of industry or environment, situational awareness means having an understanding of what you need to know, what you have control of, and conducting analysis in real-time to identify anomalies in normal patterns or behaviors that can affect the outcome of a business or process. If you have these things, making the right decision within the right amount of time in any context becomes much easier.

Scope

A team of statisticians, data scientists and software engineers experienced in handling big data platforms such as Hadoop, MongoDB etc. Inclusion of data from social media and other publicly available sources for better insights and decision making. Integration of Sentiment Analysis engine with Big Data platform to process large volumes of data from internal as well as publicly available sources.

LITERATURE SURVEY

The aim of this section is to provide a review of the research efforts related to effective temperature monitoring systems.

Big Data

The term has been in use since the 1990s, with some giving credit to John Masheyfor coining or at least making it popular. Big data usually includes data sets with sizes beyond the ability of commonly used software tools to

capture, curate, manage, and process data within a tolerable elapsed time. Big data "size" is a constantly moving target, as of 2012 ranging from a few dozen terabytes to many petabytes of data. Big data requires a set of techniques and technologies with new forms of integration to reveal insights from datasets that are diverse, complex, and of a massive scale.

In a 2001 research report and related lectures, META Group (now Gartner) defined data growth challenges and opportunities as being three-dimensional, i.e. increasing volume (amount of data), velocity (speed of data in and out), and variety (range of data types and sources). Gartner, and now much of the industry, continue to use this "3Vs" model for describing big data. In 2012, Gartner updated its definition as follows: "Big data is high volume, high velocity, and/or high variety information assets that require new forms of processing to enable enhanced decision making, insight discovery and process optimization." Gartner's definition of the 3Vs is still widely used, and in agreement with a consensual definition that states that "Big Data represents the Information assets characterized by such a High Volume, Velocity and Variety to require specific Technology and Analytical Methods for its transformation into Value". Additionally, a new V "Veracity" is added by some organizations to describe it, revisionism challenged by some industry authorities. The 3Vs have been expanded to other complementary characteristics of big data.

Volume: big data doesn't sample; it just observes and tracks what happens
Velocity: big data is often available in real-time
Variety: big data draws from text, images, audio, video; plus it completes missing pieces through data fusion
Machine learning: big data often doesn't ask why and simply detects patterns

Digital footprint

big data is often a cost-free byproduct of digital interaction. The growing maturity of the concept more starkly delineates the difference between big data and business intelligence Business Intelligence uses descriptive statistics with data with high information density to measure things, detect trends, etc. Big data uses inductive statistics and concepts from nonlinear system identification to infer laws (regressions, nonlinear relationships, and causal effects) from large sets of data with low information density to reveal relationships and dependencies, or to perform predictions of outcomes and behaviors.

Advantages

Big Data is Timely –60% of each workday, knowledge workers spend attempting to find and manage data.
Big Data is Accessible –Half of senior executives report that accessing the right data isdifficult.
Big Data is Holistic –Information is currently kept in silos within the organization.Marketing data, for example, might be found in web analytics, mobile analytics, social analytics, CRMs, A/B Testing tools, email marketing systems, and more each with focus on its silo.
Big Data is Trustworthy –29% of companies measure the monetary cost of poor dataquality. Things as simple as monitoring multiple systems for customer contact information updates can save millions of dollars.
Big Data is Relevant –43% of companies are dissatisfied with their tools ability to filter outirrelevant data. Something as simple as filtering customers from your web analytics can provide a ton of insight into your acquisition efforts.
Big Data is Secure –The average data security breach costs $214 per customer. The secureinfrastructures being built by big data hosting and technology partners can save the average company 1.6% of annual revenues.
Big Data is Authoritative –80% of organizations struggle with multiple versions of the truthdepending on the source of their data. By combining multiple, vetted sources, more companies can produce highly accurate intelligence sources.

Big Data is Actionable –Outdated or bad data results in 46% of companies making baddecisions that can cost billions.

Applications

- Health Care
- Education
- Media
- Manufacturing
- Internet of Things(IOT)
- Retail

Description

Big Data is a phrase used to mean a massive volume of both structured and unstructured data that is so large that it is difficult to process using traditional database and software techniques. In most enterprise scenarios the volume of data is too large or too fast as it exceeds current processing capacity. Big Data has the potential to help companies improve operations and make faster, more intelligent decisions. This data, when captured, formatted, manipulated, stored and analysed can help a company to gain useful insight to increase revenues, get or retain customers and improve operations. Big data is the term that may seem to reference volume of data. But in case of vendors, it may refer to technology that an organization required to handle the amounts of data and storage. The technology consists of tools and processes.

Volume: Organizations collect data from a variety of sources, including business transactions, social media and information from sensor or machine-to-machine data. In the past, storing it would have been a problem – but new technologies (such as hadoop) have eased the burden.

Velocity: Data streams in at an unprecedented speed and must be dealt with in a timely manner. RFID tags, sensors and smart metering are driving the need to deal with torrents of data in near-real time.

Variety: Data comes in all type of formats from structured, numeric data in traditional databases to unstructured text documents, email, video, audio, stock ticker data and financial transactions.

Variability: In addition to the increasing velocities and varieties of data, data flows can be highly inconsistent with periodic peaks. Is something trending in social media? Daily, seasonal and event-triggered peak data loads can be challenging to manage.

Complexity: Data comes from multiple sources, which makes it difficult to link, match, cleanse and transform data across systems. However, its necessary to connect and correlate relationships, hierarchies and multiple links or your data can quickly spiral out of control.

Potential: As the data keeps growing day by day the need for big data keeps raising. The data on global level is almost inconceivable and it keeps growing. It is estimated that all the information the world has acquired till 2013 is equal to the amount that we got in the next two years. The big data has the potential to store, search and retrieve all this information to us. It is probably the only source in the world right now that can help us the growing data.

It can be embedded with the latest technologies like IOT, Neural Networks to get the better results. The data we receive has already been revolutionized during the recent times by developing the means of social networking and it can only get better with big data.

Review on Big Data

In the current scenario, Web and its associated entity, Internet, a shadow has been cast on the same with the data explosion that has taken place in the last couple of years considering the interaction that has been taking place between people and systems associated at multiple touch points. This huge entity which is taking place at every touch point as mentioned above in its wholesome behaviour is known as Big Data. Some decades earlier, Kilobytes and Megabytes used to be entities, which used to combine the entire definition of data existing on the planet, and due to continuous interactions between people and systems that have been taking place which has lead to exponential growth of data due to which new terms such as Gigabytes, Terabytes, Petabytes, Exabyte's & Zettabytes have graced the steps of the computing world. Theorists and Researchers have propagated this that as Moore's law was to growth of transistors inside the circuits, Data in Internet would exceed the entire brain capacity of the living species. Technological advances have been taking place continuously across all the domains and the major reasons for it are advances in digital sensors, computation, communications and storage that have created humongous collection of data.

As explained above, data is generated through various sources which will be used by multiple organizations to run and understand the various business scenarios which help them understand and run their business. All the above data when analysed through various sources and methods of data analysis help organizations in studying customer behaviour, interpreting market trends and taking strategic and financial decisions. When we speak about Big Data, as we have done above, we often identify it as a jargon, catch phrase which means a exponential volume of unstructured and structured data that contains so many huge datasets which cannot be processed by traditional database management techniques and associated software techniques. With the size of the big data and simply the capacity of the data that it encompasses, it carries in itself the potential that will help companies, in making far better, intelligent and data driven decisions and help in improving operations. For most of the organizational scenarios, it can be easily identified either the data is in excess of the current storage and processing capacity, or the volume of the data is too big or it moves too fast. To give insights using the same data, that we have spoken about earlier, it has to help us in giving insights which would help us in gain competitive advantage, increasing revenues and customer retention and for that we need to capture the data, clean the data, format, manipulate, store and analyze the same.

Data Forms

Structured

When we talk about structured data, we often conclusively identify that, as soon as we placed our current data ware house in the relational database management system, the structure of the relational database management system was enforced on the current data ware house system, which is inclusive to understand the meaning associated with it. So we know, which columns are placed where, whom are they associated with and how the columns are associated in between tables and table spaces. The format of the data can be in text or numerical, but it is common understanding that for every person there is a unique identifier in terms of Age.

The entire data is organized in terms of Entities (Semantic Chunks).

Relations or Classes (Similar entities are grouped together).

Attributes (Same descriptions for entities existing in the Same groups)

Schema (All Entities in the group have a description associated with it.

Semi Structured

As we move on from structured data to semi structured data, there is little to demarcate and often the differentiating lines goes blurry. The data format that we are describing here does not conform to an explicit and fixed schema, however the tags associated with the data, if found associated with organizational structure, then the same data would be easier to analyze and organize. The same concept described here would predate the idea of XML but not HTML. Data is available in many formats, in the current scenario, electronically

- Database Systems
- File Systems e.g., Bibliographic data, Web data
- Data Exchange Formats, e.g. EDI, Scientific data
- Data that is not completely structured, but partially as spoken earlier
- Grouping of Similar Entities and semantically organized
- Entities may not have same attributes in the group

Unstructured

We have already discussed about the Structured and Semi Structured formats. Moving on to the unstructured format, this type would consists of formats that cannot be easily indexed. When we talk about indexing, it is with reference of relational tables and for the purpose of querying or analysis. This would include the file types that are associated with audio, video and image files.

Importance of Big Data

Importance would be defined in terms of how effective this concept has been for organizations, in improving their most important KPI's, also not with the quantity of data the organization has, but with the insights that it has helped to generate. Data is taken from multiple source and integrated across various environments which when analyzed can help us give answers to following:

- Time & Cost reductions.
- Customized & Optimized Market Offerings & New Product Development.
- Strategy Development & Smart Decision Making.

In a Business environment, there are a lot of decisions that are to be taken on the basis of Data & associated analytics and in simple terms, we could define it as Big Data when combined with powered analytics, lot of business related tasks can be accomplished such as:

- Root Cause Analysis can be conducted in real time for associated defects, failures and issues.
- POS based generated coupons based on Consumer Behaviour.
- Risk Portfolio – Quick Calculations/Re-Calculations can be conducted in minutes.
- Conducting Fraud Detection & use of Fraud analytics before hitting organization.

Big Data Characteristics

As mentioned before, big data is a concept and the same can be defined through a model and in our case, it can be defined through 3V model, whose definition was casted by Laney, "high-volume, high-velocity and high-variety information assets that demand cost-effective, innovative forms of information processing for enhanced insight and decision making". Recently in 2012, Gartner processed the definition of Big Data as "Big data is high volume, high velocity, and/or high variety information assets that require new forms of processing to enable enhanced decision making, insight discovery and process optimization". By definitions, both aforementioned incorporate three main features: Volume, Variety, and Velocity. When the concept is spread across organizations and different business models & big data practitioners, the 3V model can be extended to 4V (V for Value added) or 5V (V for Veracity) could be another factors dependent on the organization, which model they want to adapt. Getting a summary of the same, we can easily state that these models, provide a straightforward and all accepted definitions related to what all is incorporated in a big data based application, solution, problem and framework.

Volume: This would refer to the data from multiple sources, data being in huge capacity. It caninclude all and any kind of data, including the data that is created from all the connected devices, IoT & mobile data and all the data that is being resulted from this communication. In the current scenario, it can be easily stated that, data that is being generated is being approached in computer memory sizes, that were being heard of exabytes, petabytes & zettabytes. It will be coined to reach terms, that are still undefined and new names would have to be though for the same. However, since the data is being generated at the capacity, that we are unable to comprehend, and organizations are still trying to keep up with that pace. Consequences, that are being resulted from these actions, it has become anormalcy for the companies, to store enormous and varied amounts of data : financial, biochemistry, electronics, computer records, genetic, social networks & healthcare. The benefits that are being generated from incorporating this data, are companies at their disposal have a lot of data, which is a challenges in itself, however, valuable information can be obtained from the same regarding people & companies.

Velocity: When we talk about transferring a movie, than we really do not worry about velocity, forthat movie will be approximately 1 Gigabyte in size and would take a minute to complete. But when we talk about the big data, we can easily state that, for the data that is of the size of exabytes & petabytes, the same data, would take a lot of time to transfer and hence the velocity becomes a very important factor as it affects performance also. When we speak about the data, the contents are constantly changing, via introduction of previous or legacy collections & absorption of complementary data collections and will involve data streamed through multiple sources. Velocity not only involves, the speed at which the data is transferred, but will also involve, data streams, creation of structured records, access to data & delivery. The issues does not only lie with the velocity of incoming data but also to stream outgoing data for batch processing.

Variety: This refers to varied data types and the same can be accumulated from various sources,sources being: social networks, Smartphone, sensors in the forms of videos, images, audio, logs etc. This data can be highly structured (data fetched from the traditional database systems), semi-structured (feeds – social, rss, raw; web logs) or unstructured (clicks, audio, images, videos).

Value: It refers to the critical & valuable information that is being extracted from big datasets thatare associated with the concept of Big Data and this concept in its entirety is called as Big Data Analytics. When we speak about the 4V model, V that stands for Value becomes the most critical factors for any Tanvi, Dr. Radha Krishna Page 26 application based on Big Data & this for the sole reason that it allows to generate useful business information. Till recent times, large volumes of data were recorded as part of regulations but never analysed or exploited. Considering that fact, Value is highly subjective in nature. Big Data as a concept brings with itself the technologies, that enables people & organizations to help exploit the data, the way it was never done before.

Veracity: This term would refer to the accuracy & correctness of the data on which the analysis is tobe conducted. A lot of uncertainties can be caused for the most simple of reasons such as : Data inconsistency, Data Ambiguity, Data Duplications, incompleteness, deception, fraud, duplication, Approximated models, spam & latency. It is not necessary, that the analysis on top of big data, would give a perfect conclusive result. However, everything can be assigned a probability.

Analysis on Big Data

Data Acquisition and Recording

After discussing so much on Big Data, we can safely assume that,Big Data does not simply appear out of thin air. There are multiple sources from which data is recorded. Since we are accumulating so much data, it will be obvious, that part of the data will be of no use & speaking in that way, filtering & compression techniques can be used to sort the matter out. When speaking out about filtering & compressing, we have to take care to define them in such a way,

that they should not leave out important information. The other challenge that we would be speaking about is the generation of right metadata to describe the recording of the data and measurement of the same. Also, at the same point of time, we can easily state that, recording the information about the data at the start/birth is not useful since in the pipeline it will keep on changing and interpreted in different ways while being carried through the data analysis stages.

Information Extraction and Cleaning

Simply collecting the information would not help ingenerating analysis or will not be in a state to generate analysis and insights. Data simply in this collected form, will not be in a format which can be analysed. To do this correctly, we need a process which will help us in extracting information, that will help us in pulling out the required information and will be presented in a structured analysis, which will help us in generating insights from the same. Doing the aforementioned process again and again, and that too in a continual manner with correctness being the top priority is a technical challenges that is continuous in nature. Data cleaning is one of the primary focus areas, that assumes constraints that are well documented and well recognized on valid data or error models that have a deep understanding with reference to the data. For most of the areas, where Big Data emergence is new, these models do not exist.

Data Integration, Aggregation, and Representation

When we speak on the current topic, wewould be talking about Data analysis. Data Analysis is not as simple as the meaning it connotates, for it includes challenges than simple location, identification, understanding & citing data. When we speak about the analysis that is constituted on a large scale, it would be happening in a purely automated fashion. In the current scenario, when we speak about Database Design, it is an art as opposed to science. When we speak about the aforementioned top heroic as science, it has to be developed in a context, whether it being in the Enterprise or Cloud context. Domain Scientists has emerged as a new context, where in they are highly paid professionals along with enabling other professions in the same domain as well, to develop effective database designs. These can be achieved via various ways: design process will be assisted by devising tools, revamping the designing process, development of new techniques and all of them will be used for effective creation of intelligible database design.

Query Processing, Data Modeling, and Analysis

Big data is traditionally different from traditionaldatabase management systems and hence the methods for querying & mining in Big Data are different from traditional statistical techniques which will be different on Big & small samples. When we talk about Big Data, we often associate it with being dynamic, inter-relationships, untrustworthy & noisy as opposed to the process of mining, which will require clean, trustworthy, integrated, efficient, accessible data which can be accessed via mining interfaces using declarative queries, scalable mining algorithms and computing environments for big data. When we are speaking of the aforementioned topics, we can easily state that the data mining itself can be used to help with trust quotient of data as well improving quality of the same, understanding the associated semantics of the data & provide insightful & intelligible querying functions. One of the major problem that Big Data faces is that there is no coordination between the database packages which host the big datasets that are part of the Big Data. Part of the Database systems host the data, part deal with SQL Querying and other ones host the data mining and statistical analysis.

Interpretation

We should understand that analysis is of limited value, if user cannot understand thesame with reference to Big Data. Even if analysis is done all the reports and graphs are generated, one still has to sit and interpret the same. The interpretation cannot happen, while sitting alone in a cubicle or vacuum as the person analysing the reports and graphs has to take care of the assumptions that were used while generating the analysis and retracing the steps.

Big Data Ecosystem

While speaking about the Big Data, we can sense that and would like to statethat, it is a problem, not only related to database or Hadoop, but would constitute technologies at its core and components for data processing on large scale and data analytics. The entire structure of components to analyze by storing, processing, visualizing and delivering results to applications which were the target incorporating Big Data as "fuel" for all the processes which are data related and associated source, target and outcome. All the associations between the components and the intertwined relationships can be incorporated into the BDE or Big Data Ecosystem that will incorporate in itself all the data, supporting infrastructure, models during entire Big Data Lifecycle.

Techniques and Technologies

In the current paper, we will not be giving an in depth overview on the tools and techniques, however, we will be giving an overview of the tools and techniques associated with Big Data. This will help the reader get a association with the tools used for Big Data analytics.

Techniques

There are a lot of techniques that could be used when going to start with a project. Some of the tools which have frequent usage are summarized here.

Association rule learning

A set of techniques for discovering interesting relationships, i.e.,"association rules," among variables in large databases.

Data mining

One of the most important terms related to data-driven decision making and describesit as "searching or 'digging into' a data file for information to understand better a particular phenomenon."

Cluster analysis

Cluster analysis is a type of data mining that divides a large group into smallergroups of similar objects "whose characteristics of similarity are not known in advance."

Crowd sourcing

Crowd sourcing collects data from a large group of people through an open call,usually via a Web2.0 tool. This tool is used more for collecting data than for analyzing it.

Machine learning

Traditionally computers only know what we tell them, but in machine learning, asubspecialty of computer science, we try to craft "algorithms that allow computers to evolve based on empirical data.

Text analytics

A large portion of generated data is in text form. Text Analytics is the process ofconverting unstructured text data into meaningful data.

Technology

As with the analytical techniques, there are several software products and availabletechnologies to facilitate big data analytics. Some of the most common will be discussed here.

EDWs: Enterprise data warehouses are databases used in data analysis.

Visualization products

One of the difficulties with big data analytics is finding ways to visuallyrepresent results. Many new visualization products aim to fill this need, devising methods for representing data points numbering up into the millions. Beyond simple representation visualization can also help in the information search.

MapReduce

MapReduce is a processing technique and a program model for distributed computingbased on java. The MapReduce algorithm contains two important tasks, namely Map and Reduce. Map takes a set of data and converts it into another set of data, where individual elements are broken down into tuples (key/value pairs). Secondly, reduce task, which takes the output from a map as an input and combines those data tuples into a smaller set of tuples.

Hadoop

It is an open-source framework that allows to store and process big data in a distributedenvironment across clusters of computers using simple programming models. Hadoop is an Apache managed software framework derived from MapReduce and Big Table.

NoSQL databases

NoSQL database, also called Not Only SQL, is an approach to data managementand database design that's useful for very large sets of distributed data. NoSQL is especially useful when an enterprise needs to access and analyze massive amounts of unstructured data or data that's stored remotely on multiple virtual servers in the cloud. The most popular NoSQL database is Apache Cassandra. Other NoSQL implementations include SimpleDB, Google BigTable, Apache Hadoop, MapReduce, MemcacheDB, and Voldemort.

Usage Areas of Big Data

Big data is used efficiently in numerous fields. Some of them are listed below:

- Automotive industry
- High technology and industry
- Oil and gas
- Telecommunication sector
- Medical field
- Retail industry
- Packaged consumer products
- Media and show business
- Travel and transport sector
- Financial services
- Social media and online services
- Public services
- Education and research
- Health services
- Law enforcement and defense industry

SUMMARY

Big Data is the latest technology that stores, searches and retrieves the data for the end user.The tools and software for using this technology are being developed in the recent times by most of the multi-million companies.Our project is an effort that we did in this field using the K-means methods which is an algorithm that is being used in Big Data.

CONCLUSION

After writing this report/paper, we have developed better understanding of this concept called as Big Data after we have been able to put words to it. We have been able to define models, ecosystems and categorize elements on the basis of it. We also have been able to identify the tools and techniques that have been associated with Big Data Analytics on a frequent basis. On the basis of the analysis conducted, we identified the areas with maximum usage of Big Data Analytics.

ABSTRACT

Electric discharge machining (EDM) is one of the most efficient non-conventional manufacturing technologiesused in highly accurate processing of all electrically conductive materials irrespective of theirmechanical properties. It is a non-contact thermal energy process applied to a wide range ofapplications, such as in the aerospace, automotive, tools, molds and dies, and surgical implements,especially for the hard-to-cut materials with simple or complex shapes and geometries.This present work represents the variation of machining parameters (current, pulse on time, pulse off time and machining time) in EDM on machining performance (MRR and surface roughness) of aluminum, brass, mild steel (MS), stainless steel (SS) and EN8. The result provides a better comparative conclusion among the parameters on their performances in EDM.

Key words: EDM, Pulse on Time, Pulse off Time, MRR, Surface Roughness.

INTRODUCTION

In recent years, rapid developments in aerospace, medical instruments, transportation, and many other industrial sectors increased the need for new materials with favorable characteristics. In additionto unique characteristics, most modern materials need special manufacturing processes to enable themto be machined with ease [1,2]. Most of these materials are usually diffiult to cut by conventionalmanufacturing processes [3–5]. The unique characteristics of these hard-to-cut materials increase theirapplications, which further drive manufacturers to explore new machining processes with reasonablecost and high precision [6]. Electric discharge machining (EDM) is one of the most advanced manufacturing methods used to successfully machine conductive hard-to-cut materials [7-9]. EDM is the

process of choice tomachine hard-to-cut materials widely used in modern industries to facilitate accurate machining [10-11], complex shape machining, and better surface integrity. The process is utilized to machine electricallyconductive materials by applying repetitive sparks between electrode and workpiece. Unlike inmechanical machining, no deforming force is required between the electrode and the workpiece, andthe machining takes place without actual contact between them [12-13]. There are a large numberof variants of the EDM process such as sinking EDM, wire EDM, micro-EDM, powder-mixed EDM,and dry EDM; all of these possess work on the same mechanism of material removal. EDM can be used to machine the materials which have complex shape and size. Since there isno direct contact between the electrode and work piece, so there are no mechanical energyexisting between them. Any type of electrically conductive hard materials can be machinedby EDM irrespective of the hardness or toughness of the material.

Experimental Work

To determine the effect of Current and Pulse Time for machining of Aluminum, Brass, Stainless Steel, Mild Steel by an Electron Discharge Machine (EDM), so as to find out the optimum input parameters which will enable minimum machining time while maintaining an acceptable surface roughness. Four samples from each of the five materials were taken, the images of which are shown below.Each of the samples were of cylindrical shape with diameter of 40mm and thickness of 15mm.Then each of the four samples from each of the five materials were machined by providing randomly chosen 4 combinations of input parameters and the Output parameters were recorded as in the following tables.

RESULTS AND DISCUSSION

After the experimental procedures, the performance parameters were taken out and recorded as shown in tables 1,2,3,4 and were compared from which the following remarks were analyzed.

CONCLUSIONS

From the above experiment and analysis, the followings may be concluded.

1. The surface roughness of machined workpieces significantly increases with higher values of machining parameters i.e. pulse on time, pulse off time, duration of machining significantly. However, for better surface finish, the values of input parameters should be imposed in a controlled manner which may lead to significant improvement in performance parameter.
2. It was also obvious to state that, the rate of material removal (MRR) also increases with the increase in input parameters which is significant about the statement regarding surface roughness values of workpieces. However, the values of machining input parameters may be selected keeping in views the responses and utilization of performance parameters.

ABSTRACT

In this present work, a review of the major fatigue models and life time prediction methodologies for fiber-reinforced polymer composites subjected to fatigue loadings has been studied. A composite plate is modelled having a centre hole and four holes on each corner of the plate. For conducting this fatigue damage analysis validation, a comparison is done with available literature, which shows good agreement. Further fatigue damage analysis has been carried out on a braided carbon fiber composite plate with different material parameters. A three-dimensional finite element method has also been followed using FE Software (ANSYS 19) for the analysis of fatigue damage evaluation of both materials i.e. structural steel and braided carbon fiber polymer matrix composite material. The results have been compared with the fatigue damage behaviour of structural steel and composite material & found that the strength and the load bearing capability of a braided type composite material has much greater than that of the conventional materials .

Keywords: Composite material, Braided type composite material, Fatigue Analysis, Finite Element Method.

INTRODUCTION

Composites are combinations of two materials in which one of the materials, called the reinforcing phase, is in the form of fiber sheets or particles and are embedded in the other material called the matrix phase. The primary functions of the matrix are to transfer stresses between the reinforcing fibers/particles and to protect them from mechanical and/or environmental damage whereas the presence of fibers/particles in a composite improves its

mechanical properties such as strength, stiffness etc. A composite is therefore a synergistic combination of two or more micro-constituents that differ in physical form and chemical composition and which are insoluble in each other. Fiber reinforced polymer composites are now considered as an important class of engineering materials. They offer outstanding mechanical properties, unique flexibility in design capability and ease of fabrication. Additional advantages include light weight, corrosion and impact resistance and excellent fatigue strength. Today, fiber composites are routinely used in such diverse applications as automobiles, aircraft, space vehicles, off-shore structures, containers and piping, sporting goods, electronics and appliances. A fiber reinforced composite is not simply a mass of fibers dispersed within a polymer.

It consists of fibers embedded in or bonded to a polymer matrix with distinct interfaces between the two constituent phases. The fibers are usually of high strength and modulus and serve as the principal load carrying members. The matrix acts as the load transfer medium between fibers and in less ideal cases where loads are complex, the matrix may even have to partly bear loads. The matrix also serves to protect the fibers from environmental damage before, during and after composite processing. The carbon fiber Reinforced polymer matrix material or CFRP is the type of composite material in which the composite consists of two parts: one is matrix and another part is reinforcement where carbon fiber is used as reinforcement which provides the high or good strength and the matrix is usually as a polymer resin, such as epoxy. The braided type of composite materiala are mostly used now a days in various fields because of their superior strength &high stress bearing capacity.

The main motive to use this braided type composite materials are, Generally, when a structure is relative to elevated fatigue load or fatigue cycles, there are some micro-cracks occurs direction of the matrix of prep rag laid-up structures. So the micro-cracking can be minimized at the yarns of intersections of the reinforcing, so that this material can be easily adapted in the aerospace industry. Its impact resistance enhanced during efficient distribution of the load in a braided structure. Numerous experimental as well as computational studies have been developed to investigate the fatigue damage development. With their high stiffness-to-weight and strength-to-weight ratios, braided composites are attractive materials for aerospace and automotive components as well as sports protective equipment (Ayranci and Carey 2008). The application of residual strength for fracture is based on the fact that, when the number of loading cycle is zero, the residual strength of the material is equal to the static strength, while at failure (n = N), it is equal to the maximum applied stress (Post et al., 2008). Using GMC, (Liu et al. 2011) built a framework for a three-scale analysis of tri-axially braided composites, and effective properties of the RUC at each scale were determined. Both two-dimensional (2D) and three-dimensional (3D) braided architectures can be fabricated in many ways, such as two-step or four-step method of rectangular braiding, tri-axial braiding, circular braiding, and other displacement braiding techniques (Bilisik 2012). a number of research teams implemented FE analysis of braided textile composites based on meso-scale geometry models. In these attempts, a RUC was used to evaluate mechanical behaviour of the whole composite structures equivalently (Pankow et al. 2012; Cousigné et al. 2013; Wan et al. 2015). J.

Montesan et al [7] conducted fatigue analysis and prediction of fatigue damage behavior of a braided type composite plate having centre hole and the fatigue analysis has been carried out using FEA software ANSYS. Fiber reinforced composites are extensively used in every sector ranging from aerospace to medical instruments due to their excellent properties such as high strength to weight ratio and high stiffness to weight ratio. Despite its crucial benefits over the conventional materials, composites are yet to be a primary choice for all high strength applications due to the complex failure mechanisms under different loading conditions because of their anisotropic characteristics (Jefferson Andrew et al., 2016). S. Anand Kumar et al. [2016] described the details study about the fracture toughness and the fatigue behaviour of spider silk and s-glass epoxy composite materials which has used in the manufacturing of modern aircraft structure using finite element method (FEM) approaches. The performance of composite materials varies under different loading conditions due to their heterogeneous nature and adverse failure mechanisms. The results of many intense researches about the strain rate effect on GFRP composites show the tensile strength and strain as less sensitive to the strain rate (Naresh et al., 2016; Naresh et al., 2017)] focussed on a review of the state-of-

the-art progressive damage analysis of braided composites with finite-element simulation. This review highlighted the importance advantages & limitations of as-applied failure criteria & damage evolution laws for yarns & composite unit cells. Ganesan et al [2018] proposed a two-parameter residual strength & fatigue life model by accounting the effects of stress ratio when the structure undergoes continuous loading. The lowest tensile strength resulting from strain rate studies has been used ultimately for conducting fatigue life & residual strength tests.

Modelling and Numerical Analysis

Damage Model Formulation

The undamaged triaxially braided PMC material is considered to behave as an orthotropic linearly elastic material, and the diffuse damage is assumed to be evolving incrementally. Damage is also assumed to be orthotropic. Since in-plane tensile loading is considered, the braided composite is subjected to a plane stress state. According to CDM theory, three internal variables representing damage are incorporated to degrade the material elastic constants for the plane stress condition. The stiffness degradation expressions are given as:

$$E_{11} = E_{11}^{0}\,(1 - D_{11})$$
$$E_{22} = E_{22}^{0}\,(1 - D_{22})$$
$$G_{12} = G_{12}^{0}\,(1 - D_{12}) \quad \text{..... (1)}$$

Where $E11$ and $E22$ are the Young's modulii, $G12$ is the in-plane shear modulus, and Dij are the corresponding internal damage variables. The superscript ''o'' refers to the undamaged material parameter. The thermodynamic potential or free energy (ρ^{ψ}) is defined for a damaged orthotropic material in a plane stress state by the polynomial:

$$\rho^{\psi} = \frac{1}{2}\left(\frac{E_{11}^{0}(1-D_{11})}{1-\nu_{12}\nu_{21}}\right)\varepsilon_{11}^{2} + \frac{1}{2}\left(\frac{E_{22}^{0}(1-D_{22})}{1-\nu_{12}\nu_{21}}\right)E_{22}^{2} + \frac{1}{2}G_{12}^{0}(1-D_{12})\gamma_{12}^{2} + \frac{\nu_{12}E_{22}^{0}(1-D_{22})}{1-\nu_{12}\nu_{21}}\varepsilon_{11}\varepsilon_{22} \quad \text{.....(2)}$$

Where ν_{12} and ν_{21} are the major and minor Poisson ratios, respectively, ε_{11} and ε_{22} are components of the strain tensor, and γ_{12} is the engineering shear strain. It is assumed in this study that the damage terms D_{11} and D_{22} are only effective when the corresponding strains are positive, i.e., E_{11} and E_{22} are not affected during compressive loading states where the effects of damage are not influential on damage evolution. From the thermodynamic potential of the damaged material, the resulting stiffness tensor is defined as:

$$c_{ij} = \begin{bmatrix} \frac{E_{11}^{0}(1-D_{11})}{(1-\nu_{12}\nu_{21})} & \frac{\nu_{12}E_{22}^{0}(1-D_{22})}{(1-\nu_{12}\nu_{21})} & 0 \\ & \frac{E_{22}^{0}(1-D_{22})}{(1-\nu_{12}\nu_{21})} & \\ sym & & G_{12}^{0}(1-D_{12}) \end{bmatrix} \quad \text{.....(3)}$$

Modelling and analysis

Finite Element Analysis (FEA) is being generally used by worldwide Engineers. Where ANSYS software has been used to analyzed the Finite Element Analysis. In this present work the FE software (ANSYS 19) is used to analyze the fatigue damage evaluations. In this present work the structure or the geometry has been taken as a braided type composite plate having a center hole includes four holes on each corner. For the analysis of fatigue damage development the modeling or the geometry has been taken as one quadrant of the total geometry because of symmetry condition. The model or the geometry has given in fig. 1. Where the plate width and height is 50mm, thickness is 25mm, radios of the centre hole and corner hole is 20mm and 8mm respectively.

RESULTS AND DISCUSSION

In the present study of prediction fatigue damage development of carbon fibre polymer matrix composite plate in order to demonstrate the fatigue damage the undamaged material properties has been given in the table 1, The model has been discredited into 21989 numbers of nodes where as the 4626 numbers of elements are used to analysis and simulate the results. & its model/geometry after mashing has been shown in Fig. 2.

For analysis of the fatigue damage a cyclic load of 55 Mpa is applied in the direction of y-axis or in the tensile direction. Fig 3 represents the loading applied on the composite plate. Where a and b are the fixed load applied where c represents the tensile load applied in y direction on the model. After simulation fig. 4 represents all the results of fatigue damages at different loading cycles such as (a) 500, (b) 1000, (c) 2400, (d) 5000 cycles.

CONCLUSION

The composite materials have resulted a greater achievement in various fields of work. now a day. This paper represents a review of the major fatigue models and time prediction methodologies for fibre-reinforced polymer composites, subjected to fatigue loadings. Here a braided composite plate is modelled having a centre hole and four holes on each corner of the plate. For conducting this fatigue damage analysis validation and comparison is done with available literature, which shows good agreement.

ABSTRACT

Conventional fossil fuels, currently the main source of world's energy demand, are limited due to which the world will face energy crisis sooner or later. During the last few years, a good amount of research is being carried out on unconventional hydrogen fuel cell technologies to meet energy crisis, to mitigate environmental concerns about global warming and to decrease the emissions of carbon dioxide (CO_2). Hydrogen can be used in Polymer Electrolyte Membrane (PEM) fuel cells, providing a greater efficiency and producing no greenhouse gas emissions when combusted with oxygen. The only significant emission, in the process is water vapor. As Hydrogen is not a natural source of energy, it can be produced from a variety of sources making its production costlier than petroleum products. But, its excellent fuel characteristics in hydrogen fueled engines have become one of the most important research directions. This paper discusses hydrogen fuel cell technologies as one of the potential solutions to above issues and estimates the latest developments on use of hydrogen as an engine fuel. It presents possible future of hydrogen energy for better environment.

Keywords: Hydrogen energy, unconventional fuel cell technologies, PEM fuel cells, emissions, performance, production cost.

INTRODUCTION

With the growing concern for depletion of conventional fossil fuel and global warming, researchers are being interested in cleaner and more efficient automobile engines, powered by bio-fuels, electricity, solar energy and in this case, Hydrogen. Fuel cell is considered as an efficient mechanism for generation of power, because the efficiency of conversion of fuel is higher in fuel cell. The lower thermal and acoustic emission, which is generated by reaction of fuel with air is also a considerable characteristics which can be noticed in fuel cell. Fuel cells have advantages like

ease in operation, maintenance, mobility and flexibility in size also. Thus, they present a potential source to be used in places where clean electric power and conventional internal combustion engines work reliably. Typical Hydrogen fuel cell thermal efficiency ranges from 40 to 60%, which is considerably more than IC engines (20 to 30%) [1, 2]. At partial load, efficiency of Hydrogen PEM fuel cell systems is more than full load and hence most suitable for the use in engines operated at partial load, e.g. when driving in city roads. Also it cells produces zero CO_2 emission due to H_2 fuel. Transportation noise in cities is also less by use of the cells. Fuel cell automotive can be applied as generators of electricity when parked at houses and offices. From this perspective, the use of PEM fuel cells is suitable, not only for personal vehicles, but also for public transports like buses [3]. PEM fuel cell automotive have less no. of hydraulic and mechanical subsystems, in comparison to conventional engines, give better flexibility in design, less platforms and so more efficient production procedures can be developed, which leads to cost cutting. The cost cutting potential of PEM fuel cells should be considered and in accordance with the alternate vehicle in future auto-market [4].

II. PRINCIPLES OF POLYMER ELECTROLYTE MEMBRANE (PEM) FUEL CELLS

PEM cells, also known as Proton Exchange Membrane fuel cells, give high level of power density and offer advantages of low volume and weight compared to regular fuel cells. These fuel cells only require hydrogen, oxygen and water to operate. Storage tanks or reformers supply pure hydrogen in these fuel cells. Solid polymer is treated as electrolyte and porous carbon plates are treated as electrodes in PEM fuel cells. The fuel cell also contains platinum (Pt) catalyst [5, 6].

PEM fuel cells operate at lower temperatures than regular fuel cells. The typical temperature of operation is around 80°C [7]. Operation at the low temperature allows them to start quickly requiring less warm-up time and eventually results in less wear of the system components and better durability [8]. But, the fuel cell needs a metal catalyst, preferably Platinum (Pt), to separate protons and electrons of hydrogen. This adds to cost of the fuel cell. The Pt catalyst is sensitive to poisoning by Carbon monoxide (CO), which makes it requisite to apply another reactor, which reduces CO in fuel gas. This additional reactor also adds to the cost [9]. Hydrogen is produced by means of a reforming reaction carried out either externally or internally. In a fuel cell operated at high temperatures (e.g. molten carbonate fuel cell), the heat is used for generating H_2 and CO_2 as well as facilitating electrode reaction simultaneously [10]. In a low temperature fuel cell, the reforming process occurs in an external reformer and the hydrogen produced is consumed to generate electricity. Figure 2 shows main components of fuel cell system.

If natural gas has to be used, it is processed in a reformer to create hydrogen rich fuel. Figure shows schematic diagram of H_2 and O_2 fuel cell [11]. The processed fuel is fed to the fuel cell between the end plate (bipolar separator plate) and the nickel anode. Simultaneously, air (oxygen) is cleaned with filters and then channeled between the cathode and bipolar separator plate (end plate). Sandwiched in between the anode and the cathode is the electrolyte (40% KOH) [12, 13]. This porous material enables the hydrogen and oxygen to chemically react. Electrode reactions occur releasing free electrons that flow an external circuit through load and to the cathode. The following reactions take place in the fuel cell:

Anode: $2H_2 + 4OH^- \rightarrow 4H_2O + 4e^-$
Cathode: $O_2 + 2H_2O + 4e^- \rightarrow 4OH^-$
Cell reaction: $2H_2 + O_2 \rightarrow 2H_2O$

Mechanism of PEM cell is very basic. Hydrogen fuel cell was first demonstrated by scientist William Grove in 1839, which is given in Figs. 1 and 2. In Fig. 1, the water electrolysis producing oxygen and hydrogen by passing the electric current is shown [14]. However, in Fig. 2, the H_2 and O_2 are recombined, and the electric current is being produced. The figures demonstrate the basic principle of PEM cell [15, 16].
In the first step, hydrogen is combusted in the simple reaction to obtain water (H_2O).
The current produced, in the experiment, is less, which is because of:

- The area of contact between the electrolyte, gas and the electrode is small.
- The distance between two electrodes is large and so the electric current is resisted by the electrolyte. To address this, the electrodes are manufactured with plane surface with a coating electrolyte as shown in Fig. 2.

Each electrode has pores which allow the penetration of the gas and electrolytes from the both sides. It gives possibly the maximum contact of electrolyte, electrode and the gas. But, to show the reaction of H2 and O2 which gives the production of electric current, and place from which electrons are obtained from, separate reactions should be considered which occur at the electrode [17]. It varies with the change in types of fuel cells. At the anode, the H2 ionizes, which creates H+ ions because it releases electrons.

$$2\,H2 \rightarrow 4H^{++} + 4e^{-} \quad (2)$$

Energy is released in the reaction. At the cathode, O2 reacts with electrons released at anode, and H+ ions which forms H2O.

$$O2 + 4e^{-} + 4H^{+} \rightarrow 2H2O \quad (3)$$

The two reactions need to be continuous for which, the cathode should be continuously provided with electrons from anode [18, 19]. H+ ions or protons should pass the electrolyte also. The acid is liquid with free H+ ions, and so it fulfils the requirement. It can be seen from Eqns. 2 and 3 that two H2 molecules are required for one O2 molecule when the fuel cell is at balance. Also the electrolyte should allow H+ ions, not electrons, to pass it [20] or electrons can go by inside of the electrolyte, not in the circuit external to it. In the second case, the alkaline electrolyte cell, the basic reactions are same, but the reaction at each electrode is separate from the other. In alkaline electrolyte cell, hydroxyl (OH−) ions move and at anode, react with H2, which releases energy and electrons, and produces H2O also [21].

$$2H2 + 4OH^{-} \rightarrow 4H2O + 4e^{-} \quad (4)$$

At cathode, oxygen does reaction with electrons from the electrode and water from electrolyte, which forms OH− ions.

$$O2 + 4e^{-} + 2H2O \rightarrow 4OH^{-} \quad (5)$$

The reactions should be continuous, for that, OH− ions should pass the electrolyte and the circuit should be formed for the electrons to travel from anode to cathode [22]. Also comparing Eqns. 4 and 5, twice hydrogen is needed as oxygen with the acid electrolyte. Though consumption of water occurs at cathode, it is reformed at anode in double speed [23, 24]. To use PEM cell effectively, huge engineering mechanisms are needed to be applied in system. When being supplied at a load, the external properties of PEM fuel cell should match the requirement of load. When PEM cell is being supplied at a load, which varies, is it even more challenging [25]. For the most of the cases, an interface is required, between the PEM cell and the load, which can be a power electronic converter. For the performance to be dynamic, various operational variables, like temperature and injection rate of fuel, are required to be controlled. So a mathematical model is needed for design and performance control [26, 27]. Essential steps for fueling of H2 are [28]:

- First the station of fueling should be supplied with H2. H2 can also be produced inside the tank, but for this case, fueling stations are being considered. The hydrogen fuel can be delivered to the station by truck, train and pipeline.
- Storage of H2 can be in form of liquid or gas at the fueling station.
- As the state of hydrogen stored, can be in separate form the form which is needed at the time of fueling, the fuel state conversion from liquid to gas for final supply, is required.
- H2 is fueled to vehicle tanks.

For the case, where hydrogen can be produced onsite, it can be obtained from electrolysis of H2O. In the case, if engine is on load, the water is obtained from storage and passes inside PEM cell, where the H2 is produced and used as fuel. H2 is not stored as a gas, when engine is not on load that is when the engine is off, only water is kept in storage which if safe for passengers [29, 30]. But the method is not economical and not discussed in the current paper.

III. SUBSYSTEMS OF PEM FUEL CELLS

PEM cell automobiles have an electric drive train to generate electricity electrochemically, from fuel cell. Along with that, other subsystems of PEM cells are [31]:

A. H_2 storage and fueling subsystem
B. H_2 delivery subsystem
C. Electric drive subsystem
D. Power management and electric propulsion subsystem

Along with these subsystems, some fuel cell vehicles are attached with more mechanisms to increase the efficiency of PEM cell, like equipment to save the energy dissipated during braking. Figure 3 shows each of the subsystems and locations of them, within a H2 vehicle drive train [32]. The paper focuses on the H2 fueling and fuel storage, fuel delivery, electric drive and fuel cell power management subsystem.

A) Hydrogen Storage and Fueling Subsystem

The common form to store and supply H2 on board, is the form of compressed gas. In vehicles of current development, the typical storage pressure of H2 is 35 M Pa. Compressed- hydrogen systems operating at pressure of 70 M Pa are being developed also [33, 34]. H2 is transported from storage system to stack of PEM cells, in a subsystem called pressure piping, going by 2 to 3 stages, which decrease the pressure of H2 to 0.034 MPa, at the time when it enters the stack of PEM cells [35]. Primary element in the subsystem is compressed- H2 fuel tanks. As H2 has a low energy density per unit volume, the design of fuel tank should be proper for supplying required amount of H2 to be within practical driving range [36]. To address the limitations, fuel storage subunit is designed to take very little space and composite materials with low weight are used to produce the subunit [37, 38]. Also, to address the low energy density, the storage tank is designed to store H2 at high pressure [39].

B) Hydrogen Delivery Subsystem

Delivery of H2 from fuel tank to the stack of PEM cells is by a series of piping, flow meters, filters and pressure regulators, which is considered as the H2 delivery subsystem. Primary requirement of H2 flow control system is efficient delivery of H2 to stack of PEM cells, at stable temperature and pressure for PEM cell operation at full range operating condition [40]. Delivery of H2 should be at a specific rate, even when the pressure in storage tank drops or any change occurs in ambient temperature. The specifications for delivery of H2 are decided by storage pressure in initial condition and the pressure at duty cycle [41, 42]. Materials of piping system should be selected and then tested in such a way that it should be able to maintain the pressure without rupture [43].

C) Electric Drive Subsystem

Along with providing the electricity required to operate the drive motor, electric drive system produces electricity for charging vehicle batteries and capacitors. The PEM cell contains a stack of hundreds of fuel cells in which H2 and O2 electrochemically react to produce the required electricity [44] and they can continuously produce it when delivered with pure H2 and O2, simultaneously [45].

D) Power Management and Electric Propulsion Subsystem

PEM cell vehicles are powered with electric motors, which are capable of producing and supplying mechanical energy to drive axle, by conversion of electrical energy produced in the cell. Batteries and ultra-capacitors are the other components of the subsystem [46]. Most of the PEM cell vehicles have front-wheel drive, with electric drive motor and drive train mounted in the engine compartment, transverse along front axle. The pattern is similar to traditional internal combustion vehicles. For large SUV-type vehicles, all-wheel drive is provided with 2 electric motors, one along front axle and one along rear axle, and 4 compact motors are provided, as one for every wheel.

IV. ADVANTAGES AND DISADVANTAGES OF PEM FUEL CELLS

For the design, investment and applications of the fuel cells, the advantages and the disadvantages of fuel cells need to be considered. The main advantages of the fuel cells are: The PEM fuel cells are more efficient than regular fuel cells, simple to design and manufacture and flexible for wide application range. Also the PEM fuel cells create low emissions and are economy and environment friendly. These fuel cells are more silent in operation also [47]. The main disadvantages are: The cost of the hydrogen infrastructure, production and refueling of Hydrogen and Platinum catalyst. The high cost of construction and storage can be compensated by application of fuel cell in public transport vehicles. Construction of a water infrastructure should be in accordance with cost effectiveness for less maintenance requirement [48].

CONCLUSION

Applications of PEM cells in automobile sector will be successful when manufacturing and pricing of these vehicles will be rigorous and hand in hand with internal combustion engine vehicles. Design and testing of PEM cells should be analyzed with finite element methods to prove efficiency of the parts and metals used in production of them. PEM cells are most suitable for applications in mobile powers as their power density is high and temperature of operation is low. Still all the applications of PEM fuel cells are as fuel cells in hybrid vehicles. The hybrid combination results in the better response and ability to obtain the best characteristics of both PEM cell and conventional batteries. PEM cells can actively decrease air pollution, when a large population will start using the technology. In twenty first century, H2 fuel can be part of national economy of any country and PEM cells can be used to generate a large amount of electricity for transportation sector. So we should shape up PEM cell not as a dream but as a good solution to address the demand of energy and environment of the future.

V. FUTURE SCOPE

Fuel cells using hydrogen will have a major role in automobile and transportation industry in the coming days. Enough investigation is required to produce fuel cells in large amount at reduced price in order to make it commercialized. It could be hoped that transportation, power plants and electricity generators used with fuel cells will be a better alternative in the coming days.

Conflict of Interest

The authors declare no conflict of interest.

ABSTRACT

Right to Information or the Freedom of Information has the ability to generate more controversy and heated debate than virtually any other aspect of contemporary government and administration. Having experienced certain important contents of RTI act from different literature and experiences, researchers of this study focus on the challenges faced by the applicants since the legal systems, administration, policy and practices of RTI is unclear in terms of implementing practically. Hence the aim of the study is to evaluate the influence of the challenges on the implementation of RTI in Srikakulam District. This study carried out through a method mix of both descriptive and exploratory research with qualitative and quantitative approach. The respondents were selected through convenience sampling from Srikakulam district determine to the size of 388 all the selected variable of challenge have been analysed with comparing means and ANOVA to know the impact on the successful implementation of RTI through positive public response. It is found through interpretation that almost all the challenges are significant enough and influence a lot on implementation errors of RTI. A couple of suggestions with respect to the awareness, PIO attitude and other variables have been offered for the maximum possible utilization of RTI with the least errors.

Keywords: RTI, Challenges of implementation, public response, Srikakulam

INTRODUCTION

Freedom of expression as a key role, the system through Right to Information act process the democratic ruling by governments as coded in Article 19(1) (A) of the constitution being called as a pioneer for the liberty majorly and thereby protects other aligned activities to be participated by the public with freedom. Acquisition and dissemination through the same article is entitled to process without any hindrance which leads to form an accomplished opinion by any applicant.

If any individual fails to get the information or pay against getting information or else feel sensitive or worthless to pay because of public apathy. It tends to be stated as the same individual has no freedom. It has been a continuous experience by the public that the departments concerning transactions and communications of financial markets to government, from national security to education, form multinational corporations to small employers, from police to social welfare, medical treatment and social services have shown a contempt kind of results in implementation since they fail regularly in storing and disseminating the information to the public who need it for several liberty reasons. Information being taken to light and being transparent enough would pave the way for the eradication of corruption which in turn help the public with respect to the information comfort and trustworthy the confidence to be created in public with respect to the information given whenever needed without any flaws would in turn be a dexterous consequence of initiation to eradicate corruption. This is possible with the moment of implementing RTI properly since the legal rights are attributed with the transparency is evitable and accountability is assured. it also increases the citizens 'participation in governance and the quality of life of citizens would thereby be enhanced with integrity and rights' fulfilment.

RTI ensures the right more enforceable to question, examine, audit, review and assess government acts and decisions which should be are trusty with the principles of public interest, correctness and justice. The access to public is expected to improve from the right would rather get modified with certain constructive conditions to curb and convert to effective usage. On the other hand , it should also be noted that the concept is not completely existed in our constitution, at the same time, employing RTI is indifferent in many countries in line with its establishment (H.M. Seervai, 1976). In India, Supreme Court has had several decisions to develop the legal stand of RTI time to time.

There have been several positive and negative experiences from the applicants where in some organisations provide accurate information in time but, most of the other organisations do not. The reason behind this are vary enough and turns into the challenges could not be well absorbed by the public. The process from receiving the application to responding positively has innumerable challenges amalgamated with severe gaps. The researchers with the substance acquired from pilot study, tried to expose the implementation hurdles of the applicants where the purpose of RTI is not well served. Having studied certain important contents of RTI act from different literature and experiences, researchers of this study focus on the challenges faced by the applicants since the legal systems, administration, policy and practices of RTI is unclear in terms of implementing practically. There have been real time experiences at different government offices and the previous research experiences had been taken into consideration and analysed to measure the severity of the challenges faced by the public. Public response in this issue has been finalised with intensity.

Objectives

The objectives of the study is to

- Study the Implementation process of Right to Information act in India
- Identify the challenges to access the right to information access by public.
- Assess the public response towards implementing the right to information act in Srikakulam District
- To evaluate the influence of the challenges on the implementation of RTI in Srikakulam District

RESEARCH METHODOLOGY

The study was carried out with a cross-sectional design survey research to achieve the stated objective. This research is both explanatory and descriptive where in researchers have preferred quantitative and quantitative approaches for achieving the purpose of the study. The target population consisted of the public from Srikakulam district (A.P.) who pursued information from government offices through RTI act with respect to the proportion of rural and urban people irrespective of demographical preferences. Considering the purposes of this study, primary and secondary data collection methods have been carried out. In view of the information needed for the study, and the nature of the target population,the selection of respondents was proceeded by using Non-probability with convenience sampling technique to select the respondents from the study area.

The self-administered questionnaire contained the major independent variables in order to comprehend the challenges faced by the public in implementing the act of Right to Information. The measures were developed based on literature and empirical studies conducted previously. The questionnaire included closed ended questions of Likert scale type.

Related Literature

There have been enough literature and documents related to RTI act which can be discussed as the fundamental dicta, but the purpose of the study needs to discuss the literature related with the challenges or problems that the public who apply for the information to RTI and the severity or the intensity of the problem which prevent from the successful implementation of RTI in not only Urban but also Rural places. Undergoing the study of RAAG and PWC, the established challenges epitomised are as follows.

- Increasing level of awareness for certain communities are found highly needed since proper enlightening drive organized by the government in India is yet to be accomplished.
- Quality of RTI awareness in common public is to be emphasised, particularly among women, rural people and OBC/SC/ST category public which is found very low.
- Availability of user guidelines for RTI is another issue being considered as a challenging factor, whereas, with reference to Section 26 of the RTI Act, the responsible Government is indebted to print and dispense user guides for the people that seek information.
- The standard form of RTI assists in receiving straightforward information such as personal details and other requirements which accommodates Public Authority to classify the nature of information requisitions so that it can be established as a suo-moto disclosure.
- There have been many inconvenient hurdles while submitting RTI application where the channel noise confuses the public with the prescribed language, media, technology and payment.
- Submission of fees for application is to be made convenient since the confusions exist with cash and demand drafts, which troubles the citizens.
- Under Section 5(3) of RTI Act, PIO has to support citizens in filling in RTI applications. But there is a high dissatisfaction for the same is not served in reality.
- Limitations confronted in inspection of records are numerous since some applicants require PIOs to collect and analyse the data for previous years. However, it is noted that PIOs never do it and advised that they should obtain the same.
- It is highly observed that the information required by the applicant are not able to get in time so as considered as a big failure to provide information within prescribed time period of 30 days.
- Another problem of appeal process is very lengthy and the authority is not given judicial power regarding this.

- There is an ambiguity whether the higher judiciary of the country is covered under the provisions of the RTI Act or not. Unless the higher judiciary starts considering its responsibility, complete transparency is impossible.

The present study has included four influencing challenges from the above specified challenges i.e. Low level of awareness, Non-availability of user guides for RTI implementation for information seekers, Constraints faced in inspection of records, and Failure to provide information within 30 days which have been found important at the present situations in Srikakulam district. Researchers also conducted a pilot study with experts and administrators from which other variables such as PIO willingness/Attitude to provide information, Responsiveness from state information commission and Applications with political interest rather than public interest have also been included.

Analysis And Interpretation

Challenges faced by the public from the implementation of RTI today: It is found and easily understood that the problems faced by the public while implementing RTI in the district of Srikakulam have been severe enough as the comparing mean values of all explored in table 1. However, the element "Responsiveness from state information commission is poor" carries the highest mean value of 4.0917 and the element "Applications are with political interest rather than public interest" shows the least mean score with 3.1101. Hence, it can be understood that the severe problems while applying or implementing RTI in Srikakulam district are poor response from state Information commission, Negative attitude of PIO and Availability of Low level of information for they carry 4.0917, 3.9907 and 3.9000 respectively. At the second rate the elements influencing moderately carrying mean values are around 3.7 as shown in the table are Non-availability of User Guides, Constraints faced in inspection of records and Failure to provide information within 30 days represent the intensity is moderate but the public.Quite surprisingly, the respondents have shown a little disagreement towards a blame that the applicants are seeking information from the government offices through RTI out of political interest rather than public interest.

Table 2 shows the relationship among the severity of different challenges and the successful implementation of RTI act. The F values between dependant variable and independent variable starting from "Non-availability of User Guides" is 108.080, "Constraints faced in inspection" is 67.320, "Failure to provide information within 30 days" is 92.474, "PIO willingness/Attitude" is 234.606, "Responsiveness from state information commission" is 88.194, "Low level of information" is 66.405 and "Applications are with political interest rather than public interest" is 112.449. The values for all independent variables show high significance with 0.000 at the level of 0.01. So it can be concluded that all the factors are showing high significance on the Implementation of RTI in Srikakulam district. Hence it can be interpreted that the variables selected by the researchers have been proven imperative and have high level of impact and influence.

CONCLUSIONS

The utmost dissatisfaction has been shown by the respondents towards the administration of government offices handling RTI act and delivering services in line with all the variables/ problems which are considerably significant.
It can be concluded that the poor responses from state Information commission, Negative attitude of PIO and Availability of Low level of information are considered as the most painful for the respondents at the first rate. On the other hand, the elements influencing moderate are Non-availability of user guides, Constraints faced in inspection of records and Failure to provide information within 30 days represent the intensity is moderate but the public.

RECOMMENDATIONS

1. Since the problems are all significant enough, the execution of RTI act is yet to be flexible with respect to the applicants' awareness and the government should incorporate certain amendments in the act to make it deliverable at ease.
2. PIO's responsiveness being negative is not to be excused at all. PIO's attitude provide information with accuracy as per norms should be made mandatory.
3. Achieving the objectives of RTI act with transparency as the main goal should not lead to any corruption and the related authorities should focus on the continuous monitoring with accountability.
4. Awareness of RTI act to the rural community is to be highly promoted since there are very less people found known about this act. Though some know about this as a basic knowledge, knowing how to implement is a big dilemma.

ABSTRACT

Halogenated refrigerants of present generation drops down the ozone layer and catalyses global warming. Replacement of synthetic halogenated refrigerants by natural organic substances is the front line research challenge over last few decades. The recent work is an endeavour to estimate a sharp range of Acetone-water ratio that ratifies to a suitable refrigerant in vapour compression units with pros and cons. The natural solution in designed ratio was retrofitted in a vapour compression unit coupled with engineering equation solver (EES) considering trendy R-134a as base line refrigerant. The ratifying parametric conditions were calculated in terms of $(COP)_{ref}$, nontoxic character ,reasonable compression ratio, work input, flammability, durability, stability & environment friendliness. In comparison to synthetic refrigerant R-134a the designed ratio of Acetone-water solution was echo friendly with proximal $(COP)_{ref.}$ The designed ratio was non corrosive with greater thermal and chemical stability for domestic refrigeration and air conditioning units.

Keywords— Vapour Compression Refrigeration System, Acetone & Water Solution, designed ratio, process development, validation.

INTRODUCTION

Recycling the refrigerant by change of phase through vapour compression system is the evolutionary technology of recent generation. The technology has been widely adopted in refrigerating, air conditioning, heat pumps and water chillers unit. The context of technological evolution of refrigerants includes hydrocarbons (HC), hydroflurocarbons (HFC), HFC/HC, hydrochloroflurocarbons, (HCFC), carbon dioxide (R744) and ammonia (R717). Amongst these working fluids halogenated refrigerants are rampantly used in vapour compression systems reasoning its good thermodynamic and thermo-physical properties. However the toxic nature of these fluids vitiates the ozone

depletion potential (ODP) and global warming potential (GWP). International refrigerant protocol standard (Montreal and Kyoto) refrains use of halogenated refrigerants in the vapour compression systems. However it does not encompass hydrochloroflurocarbons (HCFC) till 2040, in developing countries like India outgrown by 2030 [1]. Use of HCFC as refrigerant recently drops down in developed nations. Minimizing the emission of six categories of green house gas contributed by hydroflurocarbon (HFCs) refrigerants has been mandated by United Nations Framework Convention on Climate Change (UNFCCC) [2]. In recent context designing right combination of echo-friendly mixture finds new way of investigation. Combination of HC and HFC mixtures reduces GWP. However the combined mixture is instantly inflammable that restrains its use in bigger capacity units [3]. Smaller units prefer HC refrigerant mixtures for domestic purpose that requires lower volume of refrigerants.

HFC mixtures are ozone-friendly associated with significant GWP and immiscible to mineral oil, which require synthetic lubricants (such as polyolester). The presence of synthetic stuffs in HFC are hygroscopic in nature, expensive, causes itching in contact with skin and provides way to several service problems in overhauling [4]. Problems associated with HC and HFC refrigerant mixtures are overcome by blending hydrocarbons with HFC that facilitates miscibility (with mineral oil) and reduces flammability [5]. Basing on investigations HFC/HC mixtures are miscible with mineral oil with one-third GWP than HFC, when used alone. Hence HFC/HC mixtures can replace halogenated refrigerants [6].Use of natural working fluids as refrigerants have been reported in VCR and VAS [7].Use of different pure HC refrigerants have been reportedly experimented [8].Evolutionary development of pure refrigerants from early use to the present has been reported [9]. Investigations on environment-friendly alternatives reported that refrigerant mixtures are the replacement for halogenated refrigerants [10].

In recent context no specific or very little investigations have been reported on refrigerant mixtures. Hence, the present work more broadly investigates the performance of new refrigerant mixture: Acetone water with special focus on its possibility as an environmental friendly refrigerant. Moreover, the study involves estimation of echo friendly impact, economy of use in fraternity with retrofitting, forecasting of refrigerant properties in the scenario of refrigeration and air-conditioning segment with technical pros and cons.

MATERIALS AND METHODS

Selection of materials

The UNFCC mandates phases-out pure halogenated refrigerants. A very narrow range of pure fluids exists in nature that exhibits parallel properties to halogenated refrigerants. Hence mixture of two or more refrigerants that shows adjustment of properties and behaves as a single substance is desirable. Azeotropic mixtures evaporate and condense as a single substance with their properties being different from those of constituents. Boiling point of azeotropes is lower than either of their constituents used as refrigerants. Acetone water solution was azeotropic in operating range of temperature and pressure. However further increase in temperature and pressure made it nearly azeotropic mixture. Nearly azeotropic mixtures are having very low temperature glide in the range between 0.2 and 0.61^0 C that does not affect the hardware design. So in present investigation azeotropic mixture of Acetone to water in the ratio ranging from 54: 1 to 76:1was trialed. The range of ratio was designed basing on unwieldy iterative trial and error with evaluation of properties.

Material characterization

Acetone commercially known as propanone, is an organic compound with the formula $(CH_3)_2CO$. It is the simplest and smallest ketone, colourless, volatile, flammable liquid with a characteristic odour. Acetone is miscible with water. Acetone is produced and disposed of in the human body through normal metabolic processes. The other chemical identity specifications were given in Table.1.

Process development and validation

The Acetone water refrigerant in designed ratio was retrofitted to a test rig using R-134a as baseline refrigerant. The COP of both refrigerants was recorded for comparison. The technical specifications of the test rig were: Model UPSON, Model number-URF-M5, Rated voltage 240V, Electricity consumption 0.5kWh/24h & Power 90W, and Weight 19kg, Volume 47L coupled with engineering equation solving software (EES).The major feature of EES is the high accuracy thermodynamic property database that is provided for hundreds of substances in a manner that allows it to be used with the equation solving capability. Refrigerants retrofitted alternately were R-134a and Acetone water. The flow diagram of the refrigerant test rig was depicted in Fig.1.

Rig thermodynamic processes

Process: 1-2(Compression)

The process was adiabatic. Work was done on refrigerant ($W=v.\ dp$) by energy input. Compression was dry, wet or super heated depending upon the phase of the refrigerant at that instant.

Process: 2-3(Condensation)

The process was isobaric rejection of heat from refrigerant to atmosphere.

$$Q_1=W_{C+}Q_2$$

Process: 3-4(Expansion)

The process was adiabatic retrofitted with capillary tube expansion valve.

Process: 4-5(Evaporation)

The process was isobaric heat addition from desired cooling space to the evaporator flooded with refrigerant. Figure.2 shows the flow diagram of different processes with phase change.

$$Q_2=m.c_p.dt$$

Refrigerant mixture

The research evolutionary gestation period of R134a emerged out with discovery of the damaging effect of CFCs and HCFCs refrigerants to the ozone layer. It is known as Tetrafluoroethane (CF3CH2F) of HFC refrigerant family. Present generation of refrigeration and air conditioning rampantly use it as CFCs and HCFCs replacement in centrifugal, rotary screw, scroll and reciprocating units. It is safe for normal handling as it is non-toxic, non-flammable and non-corrosive. Currently automotive sectors use it in interior air conditioning. The properties of R134a were summarized in Table.2.

However UNFCCC mandates use of HCFC till 2040, in developing countries like India outgrown by 2030 [1]. The combined mixture is instantly inflammable and raises Global warming potential (GWP) that restrains its use in bigger capacity units [3]. Hence in present context the search for an environmental friendly refrigerant was prevalent focusing on proximal COP. Acetone water mixture in designed ratio 54: 1 to 76:1was such a nearly azeotropic refrigerant on which attention of investigation was concentrated to find its possibility as an environmental friendly refrigerant. A summary of chemical properties, structure and thermo chemistry of Acetone to be used as primary component of refrigerant mixture was given in Table.3.

RESULT AND DISCUSSION

Selection of materials

Acetone was preferred as primary constituent of novel nearly azeotropic mixture refrigerant considering its ball-beam structure, dimensional structural formula & bond order configuration. The structural geometry was shown in fig.3. The structural geometry contributes to : thermal and chemical stability, low density(low pumping work to circulate), assessable range of boiling point(not achieved in halogenated refrigerants),non toxic nature, comparatively higher emissivity & refractive index than conventional refrigerant(low compressor work), low freezing point of -78^{o}c(superior cooling effect), stoechiometric pressure impact on conduit walls(latent heat transfer),better lubrication property(no scaling inside copper conduit at elevated temperature & pressure), odorous(easy leakage detection) and negligible GWP & ODP.

However its high inflammability, low density and low specific heating value were imperative issues to be addressed before considering its possibility as primary constituent of refrigerant mixture. High flammability restrains its use in bigger units, low density increases possibility of leakage in conduit and valves when compressed and low specific heating value is not tolerable. The associated problems were addressed by mixing water with Acetone to form a nearly azeotropic refrigerant solution in the ratio of 54:1 to 76:1. Mixing of water increased its density and specific heat thus decreasing chances of leakage and manages the sharp increase in temperature while adding heat. It also moderates the flammability risk. The mixing of water in designed ratio (54: 1 to 76:1) did not intervene any irregularity in nearly azeotropic behaviour of the mixture refrigerant over a wide temperature range as it was readily soluble to Acetone. So, the solution of Acetone & Water (54: 1 to 76:1) holds optimized characteristics of a refrigerant. However the designed ratio (54:1 to 76:1) was to be fairly maintained, any violation may cause serious damages to the system. Excess water causes corrosion, valve choking and seizure of piston or vanes of compressor unit. It also impairs heat absorbing & radiating nature and compressibility of refrigerant mixture causing decreased $COP_{ref.}$. Fair maintenance of designed optimal ratio (54:1 to 76:1) was the investigation objective of present research endeavour to develop a better ever refrigerant mixture. The experimental thermodynamic behaviour of the refrigerant solution was presented in table.4.

Material characterization

Choosing Acetone as primary constituent of refrigerant mixture was rationalized to its lowest contribution to global warming, considering various hydrocarbons.Table.5 represents the contribution of various possible hydrocarbon refrigerants to global warming.The other inference of identifying Acetone as primary constituent was its fairly change of phase with respect to designed range of temperature and pressure and thermodynamic behaviour as a refrigerant. The figure.3 explains the pressure and temperature oriented phase change and table.6 represents the thermodynamic behavioural comparison of Acetone with other refrigerants in critical range of pressure and temperature.

The comparative thermodynamic behaviour investigated that Acetone inferred: high latent heat of vaporization, suction gas density, no excess pressure inside evaporator and condenser, chemically stable with water, non-corrosive, non-toxic and environment friendly. The flammability was moderated with adding water in designed ratio (54:1 to 76:1). Other favorable result was critical temperature and triple points were well beyond the designed range of working.

Process development and validation

The test rig was initially charged with R-134a as baseline refrigerant. Performance of R-134a was evaluated from the parametric conditions of compression, condensation, expansion and evaporation employing engineering equation solver software (EES) coupled with test rig [11]. Secondly the rig was retrofitted with presently developed acetone

water solution refrigerant in optimal ratio 76:1 to record the software generated performance. The performances of both the refrigerant were compared considering R-134a as baseline refrigerant. Comparative results obtained were presented in Table.7.The parametric inputs were the working temperatures at superheating, sub cooling and compressor speed (Ta, T_{ff} & T_{fz}). Thus, for a given set of guessed values for P_e , P_c , h_1 and T_R , the compressor sub-model calculates h_2 , the condenser sub-model estimates h_3 and T_3=T(P_c,h_3), the internal heat exchanger sub-model calculates h_4 and T_1 , and the evaporator sub-model calculates h_5 and T_5 =T(P_e ,h_5).

CONCLUSION

The present investigation validated a nuance in COP between R-134a and Acetone water mixture. The proximal COP of Acetone water mixture to prevailing used refrigerant R-134a was addressed to unwieldy process development in designing the ratio of mixing Acetone with water (54:1 to 76:1). The economical viability of using Acetone as primary constituent of presently developed refrigerant mixture was addressed to its lowest unit price than halogenated refrigerants. The GWP, ODP and flammability of the developed refrigerant was also moderated by designed ratio of mixing with water (54:1 to 76:1).More over the designed refrigerant was echo friendly, stable chemically & thermally, non toxic and non corrosive in nature.

ABSTRACT

Foxtail millet (*Setaria italica* L.), like other small millets belongs to the family Poaceae, is drought tolerant crop grown in drylands under rainfed conditions with higher CO_2 abatement opportunities. In the present context of temperature rise and ill effect of climate change, the low input demanding and ecologically sound foxtail millet can automatically be chosen for agricultural sustainability in drylands. Foxtail millet is nutritionally superior to other cereals. Recently developed varieties of foxtail millet respond well to added nutrients and proper nutrient management is essential for production sustainability. In the present paper, the available literature on different options of nutrients application to foxtail millet for sustainable productivity is reviewed. Application of nitrogen in the soils with low available nitrogen is beneficial for enhancing productivity. Nitrogen in combination with phosphorus or recommended dose of balanced fertilizer can boost the yield of foxtail millet. For sustainable production of foxtail millet, integrated nutrient management can be adopted. As there is insufficiency in research and the crop is having nutritional and ecological importance, there is ample scope for future research towards precision nutrient management.

Keywords: Nitrogen, Application, research, foxtail millet,

INTRODUCTION

Millets are a group of coarse cereals that produce small seeds and used mainly as food, feed and forage grown in arid and semi-arid regions in the world. Amongst different millets, sorghum (*Sorghum bicolor* L.) and pearl millet (*Pennisetum glaucum* L.) are known as major millets, however, rest are categorized as small millets. Under fragile ecological conditions, small millets are cultivated by resource-poor farmers in subsistence cropping system with an acreage of around 7.0 lakh ha with a productivity of 633 kg/ha (Maitraand Shankar, 2019). In India, small millets are grown in 6.8 lakh ha and the country ranks the first with 80% of the production of Asia (Maitra, 2020). Out of different small millets cultivated in India, finger millet (*Eleusine coracana* L. Gaertn) shares about 80% of production

and it is followed by *kodo* millet (*Paspalum scrobiculatum* L.) and foxtail millet (*Setaria italica* L.). Foxtail millet, like other small millets, belongs to the family *Poaceae*,is highly drought tolerant crop grown in drylands under rainfed conditions with higher CO_2 abatement opportunities (Brahmachari *et al*., 2018). In India, the cultivation of foxtail millet is confined mainly to Andhra Pradesh, Karnataka and Tamil Nadu. The nutritional value of foxtail millet is highly appreciating as 100g of foxtail millet grain contains fibre 8 g, protein 12.3g; carbohydrates 60.9g, fat 4.3g, calcium 31mg, iron 2.8mg, phosphorus 290mg, vitamins 3.3g, minerals 3.3g and food energy 323-350 K Cal (Vanithasri*et al*., 2012). Besides, small millets are considered as functional foods containing bioactive ingredients useful to combat against chronic diseases (Banerjee and Maitra, 2020). In the present context of adverse climatic conditions due to global warming, dryland agriculture became more risky and growing of hardy crops is one of the solutions to combat climate change. Foxtail millet is a low input demanding and ecologically sound crop which can automatically be chosen for agricultural sustainability in drylands. The average productivity of foxtail millet in India is 780 kg ha^{-1} (Monisha *et al*., 2019). But under proper agronomic management, the crop can produce about double of its yield in unit area as evidenced in experimental results (Ramyasri *et al*., 2018; Mubeena *et al*., 2019). Sufficient research work has not been carried out on nutrient management in foxtail millet for maximization of productivity. Based on published literature, an initiative has been taken up to gather information together on nutrient management in foxtail millet targeting production sustainability.

Nutrient Management Options

Foxtail millet is a low nutrient demanding crop, but during recent times improved varieties have been developed which respond well to applied nutrients. In comparison to major cereals, much information on nutrient management in foxtail millet is not available for different agro-climatic zones under different cropping system. Researchers suggest adopting integrated nutrient management (INM) for different crops. The INM is proportionate use organic manures, biofertilizers and chemical fertilizers. The combined and harmonious use of nutrients from different sources in INM enables the sustainable agricultural production system by enhancing soil fertility, water holding capacity and soil microbial activity with a holistic impact on soil physico-chemical and biological properties (Maitra *et al*., 2019).

Chemical Fertilizer

Nitrogen and phosphorus

Nitrogen (N) is one of the essential primary nutrients that influence growth and productivity of crops including foxtail millet. N is the component of the proteins and useful for the function of chlorophyll, various enzymes, nucleic acids and indispensable organic compounds (Ohyama, 2010; Aczel, 2019). To provide N, generally chemical fertilizers are applied to crops. NavyaJyothi*et al.* (2016)observed that application of 50 kg N ha^{-1} increased growth and productivity of foxtail millet in a trial conducted at Tirupati, Andhra Pradesh in sandy loam soil with low available N.Nandini*et al*. (2018) noted that application of 125% recommended dose of nitrogen (RDN) expressed better performance of yield attributing characters like number of effective tillers, panicle length, panicle weight and test weight of foxtail millet at Shivamogga, Karnataka in typical red sandy loam textured soil of with slightly acidic in reaction and low available N.

The results revealed that 125% RDN registered significantly more grain and straw yields and protein content of seed than 100% RDN, but 100% N resulted in more crude fibre content in seed. Further, a field experiment carried out duringrabi season in rice fallows at Naira, Andhra Pradesh in neutral sandy loam soil with low available nitrogen showed that application of 80 kg N ha^{-1} produced more grain (1684 kg ha^{-1}) and straw (3101 kg ha^{-1}) yields of foxtail millet and higher N uptake than lower doses(Ramyasri*et al*., 2018). Phosphorus (P) is a vital nutrient which triggers plant growth and development. In process the photosysthesis, adenosine triphosphate (ATP) is produced which is the energy unit of plants and P is there in the structure of ATP. Like N, applied P increased yield of foxtail millet as noted in different experiments. In the alfisols of Karnataka, the application of 30 kg N+15 kg P_2O_5 ha^{-1} gave higher grain yield (1792 kg ha^{-1}) which was followed by 22.5 kg N+11.25 kg P_2O_5 ha^{-1} which yielded grain of 1615 kg/ha

(Naik*et al*. 2010).Reddy *et al*. (2019)observed a synergistic effect of N and P and application of 60 kg N ha^{-1} and 40 kg P_2O_5 ha^{-1} resulted in highest growth, grain and straw yield as compared to other treatments under south Odisha conditions.

Combined Application of nitrogen, phosphorus and potassium

The proportionate use of three primary nutrients, namely, N, P and K is known as balanced fertilization to crops. As per the soil fertility status balanced application of these three major nutrients are recommended to obtain optimum productivity of crops. Researches were carried out on application of N, P and K in foxtail millet which indicated that application of balanced fertilizer enhanced productivity (Hasan*et al*. 2013). In medium black soil of Raichur, Karnataka foxtail millet recorded significantly higher grain and straw yields and nutrient uptake with the application of 100% recommended dose of fertilizer (RDF) than 75% and 125% of RDF (Mubeena *et al*., 2019).

Organic Manures and Biofertilizers

Organic manures supply almost all essential nutrients to crops, but the analytical value is less. During the present time, there is substantial growth in organic farming with an increasing demand of organically produced foods. In organic farming, different organic manures and biofertilizers play an important role to supply nutrients to crops. Research evidences indicated that organic manures and biofertilizers enhanced productivity of foxtail millet significantly. Upendranaik *et al*. (2018) observed that a combination of different organic manures along with mulching increased growth and productivity of foxtail millet. Application of *jeevamrutha* + mulching + IFS compost + vermicompost + *panchagavya* resulted in significantly more grain yield of foxtail millet over control at Raichur, Karnataka. Rafi *et al*. (2012) and Rafi and Charyulu (2016) reported that inoculation of *Azospirillum* sp. and phosphate solubilizing bacterium (PSB) individually and combined inoculation improved the yield of foxtail millet.

Integrated Nutrient Management

Integration of organic manures, inorganic fertilizers and biofertilizers play an important role in enhancing crop productivity, sustaining a soil health and reducing adverse effects on environment. Research trials carried out on INM indicated positive impacts on productivity of foxtail millet. A field experiment conducted at Sundarbazar, Nepal, clearly indicated that INM resulted in enhancement of productivity of foxtail millet and application of FYM 6 t ha^{-1} along with NPK 60:30:20 kg ha^{-1} gave 152% more yield than control (Ojha*et al*., 2018). In another experiment, application of 50% RDF + 25% N as neem cake + *Azophos* recorded maximum values in expression of plant height, number of tillers, panicle length, Test weight, grain and straw yield in sandy loam read soils at Madurai, Tamilnadu and the treatment was superior to 100% RDF (44:22:0 kg N:P_2O_5:K_2O ha^{-1}) and absolute control (Monisha*et al*., 2019).However, Kumaran and Parasuraman (2019) recorded that integrated nutrient management increased grain yield of foxtail millet at Tiruvannamalai district of Tamilnadu and combined application of farmyard manure, recommended dose of fertilizer and foliar application of 3% Panchagavya at 20 days after sowing gave the maximum grain yield (1652.5 kg ha^{-1}). A combined application of 75% RD N through Urea + 25% N through PM + *Azospirillum* Seed Inoculation gave maximum grain yield (2.31 t ha-1), higher net return and maximum B:C ratio (2.59) at Prayagraj, Uttar Pradesh in sandy loam soil (Selectstar Marwein *et al*., 2019).

Future Scope of Research

Chemical fertilizer production process releases enough of GHGs causing global warming and there is urgent need for prevention of wastage and increase on nutrient us efficiency. The study reveals that enough research has not been conducted on efficient nutrient management of foxtail millet. But nutrient management is one of the key aspects determining productivity. Hence the future research may be carried out in the following directions.

1. Study may be intensified on INM in different agro climatic regions under various cropping systems.
2. Research work may be laid out on management of secondary nutrients and micro-nutrients in foxtail millet. Moreover, time and method of nutrient application should be considered.

3. There is enough potential for adoption of precision nutrient management technologies like soil test crop response (STCR), site specific nutrient management (SSNM),diagnosis and recommendation integrated system (DRIS) on to enhance nutrient use efficiency with target yield output. Further, latest precision technologies like use of geographic information System (GIS), sensors and hyper-spectral imagery may also be considered in future research for detection of nutrient stress in plants, geochemistry of soil and precision crop management (Hakim *et al*., 2016; Bogue, 2017; Robinson and Kinghan, 2018).

CONCLUSION

As foxtail millet is cultivated in low fertility soils of drylands with improper management practices, fertilization plays a pivotal role for increasing the crop yield. INM is considered as one of the best approaches for production sustainability of foxtail millet. The available literature indicated some limitations like insufficient research on INM for different agro climatic zones and precision nutrient management and the present study suggests future research scope for sustainable foxtail millet production.

ABSTRACT

In this study, the growth of green gram (*Vigna radiata* L.**)** and chickpea (*Cicer arietinum* L.) were evaluated in different soil conditions. Soil, vermicompost and fly ash in different proportions were taken to observe the impact of flyash and vermicompost on shoot length of these two species. All the growth attributes was found to be maximum in plants grown in the plot with soil and vermicompost for both these pulse crop. The length of chick pea plant grown in soil and vermicompost in 4: 1 ratio was maximum with 26.9cm in 3rd week after germination of the seeds. The growth of green gram was measured and maximum growth of 18.8cm was found in soil and vermicompost with 3: 2 ratio respectively and SVF (Soil + Vermi compost + Fly ash) with 17.7cm and 1:3:50 ratio showed no growth and ultimately all plants died. The present study was undertaken to observe the impact of fly ash and on the growth and yield of green gram and chickpea.

Keywords: *Cicer arietinum* L., Fly ash, growth, soil fertility, vermicompost, *Vigna radiata* L.

INTRODUCTION

Green gram

Green gram is the most important pulse crop in the sub-tropical zones of the world. It contains 51% carbohydrates, 24 to 26% proteins, 3% vitamins (Afzal et. al., 2008). Besides providing protein in the diet, greengram has the remarkable quality of helping the symbiotic root *Rhizobium* to fix atmospheric nitrogen (Anjum *et.al.,* 2006). Still several works are going on to study the crop growth and also alternate uses of fly ash and the performances of the pulse crop (Hassan *et.al.,* 2004). The yield depends on soil codition, time of sowing, climatic condition and also the crop varieties (Anjum *et.al.,* 2006). The rate of growth varies depending upon these factors. It was also revealed that plant with optimum leaf area may produce higher yield (Pandey et.al 1978; (Dutta and Mondal 1998). A plant with

optimum leaf area and net assimilation rate may produce higher biological yield. Green gram has been consumed as a common food in china for more than 2,000 years. It is well known for its detoxification activities and it uses to refresh mentality, reduce swelling in the summer .it is beneficial in the regulation of gastrointestinal in the upset and to moisturize the skin (Min, 2001).

Chick pea

Cicer arietinum L. was first domesticated in the Middle East. It is widely in India, Australia, Pakistan, turkey. It is important cool season pulse crop and is also called as Bengal gram. I terms of pulse production India contributes total 255 to the world pulse production (Pooniya *et.al*., 2015). Chick pea is the premier crop in India and grown on 8.25 million hectares during 2014-2015 resulting 7.33 million tones yield. This accounts for about 70% of the total global area with 67% of global production (Anonymous, 2016). Chickpea is an important source of protein in the diet of the poor & is particularly important in the diets and is an important substitute for animal protein. It is an excellent source of protein of about 18 to 22%, carbohydrates from 52 to 70%, fat (4 to 10%) and minerals, like calcium, phosphorus, iron etc. and also contain vitamins (Prasad, 2012).

MATERIALS AND METHODS

The present research work conducted at the field of Centurion University campus, Bhubaneswar, during the period of September to December 2019. The field experiment were conducted to compare the growth rate of green gram and chickpea seeds in different soil condition and its impact on vegetative growth and yield of green gram and desi chickpea.

Pot preparation

Before sowing of the seeds, the pods were prepared. Eight pots prepared for sowing the seeds. Vermi compost, fly ash was added in the needed quality. Soil, vermicompost and fly ash were mixed in different proportion and filled in earthen pots(20 cm diameter and 28 cm height) Before filling the pots small broken pieces of stones were placed on the bottom of the pot for free drainage.

Soil testing

Soil testing is an important practice to know the soil in which the crop will be grown. Soil testing is done to optimize crop production and to known the nutritional content of the soil and improve the nutritional balance of the growing media. Soil samples of different pots were collected before the addition of manure to the soil. Vermi compost, soil and fly ash in different ratios i.e. soil and vermin compost in 3:2 ratio, soil and fly ash(20 gm),soil ,vermin compost and fly ash in 3:2:10 gm ratio, soil, vermi compost and fly ash in 1:3:50 gm ratio. These ratios of pods are prepared for green gram. Then soil, vermi compost and fly ash in 3:2:10 gm ratios, soil and vermin compost in 4:1 ratio, soil, vermi compost and fly ash in 2:2:50 gm and last only soil and few vermin compost for desi chickpea.

Crop/planting material

The variety of green gram and desi chickpea were used for the present study. The required seeds were collected from the market. Healthy, well matured seeds were selected. Before sowing the seeds were tested for germination was found to be over 90%. The important characteristic of two varieties was enumerated. Green gram and chickpea are medium statured, semi erect cultivars with basal primary branches. Stem pigmentation is absent at the seedling stage, but green gram becomes light green at the late vegetative stage and chickpea become light radish at the late vegetative stage respectively. Leaves are dark green with slightly pubescence. Leave size is medium with dark green colour, short petiole and rachis that form no tendrils. The flowers of green gram are light green and flowers of chickpeas are light pink. For sowing of seeds, wild type seeds are collected. Seeds sown were done in pots using traditional hand sowing method. Dry land was required for germination. Seeds were both sown in random traditional way and in lines.

Cultivation Practices

Vermi compost and fly ash were added in different concentrations. Thinning and weeding were done at 20 days after sowing, when the plant attained after 15 days of sowing. Distance between the plants was maintained at a gap of each 7 days. Second weeding was done at 35 days, when the plants attained after another 7 days gap. For crop sampling and data collection, the plants were selected randomly from each pot and were uprooted for data recording. Plant height of 10 plants was randomly measured in weekly interval. Plant height was measured randomly from each pot from the ground level to the apex of the main shoot of the plant by meter scale.

RESULTS

The growth of green gram and desi chickpea in different proportion of soil, vermicompost and fly ash were studied. Data depicted in Table 1revealed that the growth of chick pea plant grown in soil and vermicompost in 4: 1 ratio was maximum with 26.9cm in 3rd week after germination of the seeds. These plants also bear flowers. SVF (Soil + Vermi compost + Fly ash) in 3:2:10 ratio showed 25. 7 cm. followed by SV (Soil + Vermi compost) in 3: 2 ratio, in SVF with 2:2:50 ratio, showed no growth after 3rd week. All the plants died in SF with 1:20 ratio after 3rd week. The growth of green gram was measured and maximum growth of 18.8cm was found in soil and vermicompost with 3: 2 ratio respectively and SVF (Soil + Vermi compost + Fly ash) with 17.7cm and 1:3:50 ratios showed no growth and ultimately all plants died (Table 1, Fig. 1). Under such condition, the productivity of soil can be sustained at satisfactory level by use these biofertilizers.

In 1st pot we take the composition of soil and vermi compost in 3:2 ratios. The length of green gram seedlings was 9. 7 cm in 1st week. Because the composition is suitable for the growth of plants.nut in 2nd week growth of some plants did not occur because some nutrient present in the soil inhibits the growth and finally in 3rd week which plants are exist they grows 18.8 cm. In 2nd pot we take the composition of soil and fly ash in only soil: 20 gm fly ash ratios. The plant of mung bean grows 9. 7cm in 1st week. But in second week no growths occur. Because the composition is not suitable for the plants so they inhibit the growth. In 3rd week all were found to be died. In 3rd pot we take the composition of soil, compost and fly ash in 2:2:10 gm ratios. The seedlings showed 9. 7cm in length in 1st week, 13.4cm in 2nd week and 17.7 cm in 3rd week. In 5th pot the composition of soil, compost and fly ash is 3:2:10 gm. This composition was found to be suitable for the growth of chickpea plants. In 1st week, the length of plants was 10.2 cm, in 2nd week 16.7 cm and 3rd week 25.7cm respectively.

In some pots flowers emerged. In 6th pot the composition of soil and compost in 4:1 ratio showed maximum growth in length in which the seedling length in 1st week was10.3cm, 2nd week 17.9cm and 34rd week 26.9cm respectively. In 7th pot the composition of soil and fly ash was 2:2:50 gm ratios. In 1st week plant growth is 4 cm, 2nd week 10 cm and 3rd week no growths occur. In 8th pot the composition of soil and fly ash is 1:20 gm in 1st week plant growth is 8.2cm, 2nd week 10.3cm and in 3rd week no growth in length was noticed rather all seedlings died because the growth was inhibited by the minerals present in this composition leading to death of the seedlings.

DISCUSSION

Number of pods per plant was found to be highest in the plants grown in soil treated with fly ash and vermi compost.Root nodules are also found to be increased in the plants treated with the vermi compost.it was reported that the vermi compost is more beneficial than that of fly ash.In the composition of 2:2:10 gm the plant of mung bean grow well.but in the ratio of 1:3:50 gm the plants dies due to excess amount of fly ash.

CONCLUSION

This experiment revealed that fly ash can be mixed with the soil in minimum doses with vermicompost for cultivation of crops. But the pulses should be evaluated for their nutritional composition to estimate the trace

element and heavy metals. From these results it can be summarized that the plant growth depends on the status of soil, variety and also other abiotic factors including climatic condition.

ACKNOWLEDGEMENT

The authors are thankful to the gardeners and horticulturist Mr. Prasanna Kumar Sethi of CUTM, for their constructive cooperation during this piece of work.

ABSTRACT

This work describes the conceptual design study before the detail designing, fabrication and testing of the airships. The airship is planned to design for indoor flight for 30 minutes with taking a payload of 0.5kg and flying at a constant altitude. This report provides the standard methodology for RC airships, basic buoyancy, aerodynamic calculations and structural envelope considering four basicflight parameters such as takeoff, hover, cruise and landing. The theoretical force analysis was done by definding maximum speed, cruise altitude and takeoff time. The thrust required in each flight regime was then determined based on calculation of the lift, weight and drag forces. The conceptual design was done by taking five concepts for the envelope shape to find out the optimal shape of airship. An iterative procedure was developed to optimise the envelope design based on the weight of components and the lifting force needed to achieve neutral buoyancy.

Keywords: Airship, Blimp, Conceptual design, Airship envelop

INTRODUCTION

Aircraft can be divided into two groups: lighter-than-air aircraft (LTA) and heavier-than-air aircraft (HTA) [1]. Conventional fix-wing and rotation-wing aircraft which utilize lifting surfaces like wings and blades as the source of lift belong to HTA. LTA is mainly referring to aircraft such as balloons and airships (blimps). Unlike HTA, LTA is designed to contain within their structure a sufficient volume of gas lighter than air (heated air, hydrogen, or helium)

to acquire enough lift force from the buoyancy of the gas. Without consuming extra fuel to generate necessary lift for floating, airships over advantages over air cargo transportation in the past.

Many different types of aircraft are designed and fabricated for diverse applications and scenarios. A survey of recent developments in aerial robotics gives a general overview of the definition, types, categories, and topics of aerial robotics[2]. This work describes classifies and briefly introduced more than one hundred high-quality aircraft papers from more than thirty thousand that have been published in the top journals and conferences in a systematic way. In the last 50 years airships have been used for certain niche applications such as advertising, surveillance and aerial photography. The most well known advertising craft is the Goodyear blimp which has been prominent at major sporting events. Smaller craft have been used for advertising and photography in large indoor arenas such as basketball and ice hockey stadiums. The United States Coast Guard has also experimented with using airships for high altitude surveillance of its borders and coastline.

Some earlier scientific and technical notes and documents about airship design can be found as technical reports from NASA. There are two famous reports by Tuckerman [3] [4], emphasizing two most critical issues of airship design - the determination of forces on an airship hull and inertia factors. Regarding airship, [5] introduced the recent researches and conceptual designs of airships and classifies the airships according to its body. In paper [5], a state-of-the-art literature review on airship dynamics modeling is presented, aerodynamics and flight dynamics modeling method are described. This also provides the structural flexibility, incorporation of atmospheric turbulence as well. Based on six degrees of freedom, an attractive dynamic model is presented in ref. [6]. In ref.[7], a blimp-based robot and its navigation system are introduced. The blimp is a commercial kit which can be used as platform directly. Ref. [8] introduces a design methodology and fabrication of an easily deployable finless airship for indoor surveillance and advertisement. The detailed and step-wise procedure for designing and fabricating indoor remotely controlled airships are discussed in [9].

A comparison between the airships using design methodology introduced in this work with some other commercially available airships are also exhibited. Paper [10] introduces an airship that mimics fish-like movement in the air, propelling an airship by undulating its hull and a caudal fin. A work on DEA predicted that DEA strip actuators could reach 90% maximal efficiency in optimal conditions. However, an actual peak efficiency of 18% was measured in the experiment due to the high energy loss of such a voltage transform [11]. The propulsion efficiency analysis of fish-like robot is exhibited in [12], the relationship of speed and energy efficiency are analyzed. Ref. [13] does a research on the efficiency of fish propulsion. As a commonly used propulsion unit for indoor airships, small-diameter propellers performance data including energy performance are tested and a reliable database of performance data of many propellers has been created in [14]. Recent years, several fish-like indoor airship projects appeared due to high efficiency of fish propulsion. [15] [16] the propulsion efficiency of both propeller and fish movement is studied. The efficiency of fish movement and propeller is studied in [17] and [18] respectively.

Aims

The project aims to design and construct a small airship capable of indoor flight.
Specifically, this project aimed to achieve three main objectives:

- To design and build an airship to meet specified flight parameters
- To implement a complete manual and partial automatic control system
- To have the ability to capture images and transmit them to the ground

The final product could be used for indoor aerial photography, surveillance and advertising purposes. This paper discuses only the conceptual design part for a airship of following requirements.

CONCEPTUAL DESIGN

Desired Modes of Flight: The modes of flight describe the rotational and translational movement of the airship. The requirements of each flight mode were determined based on the feasibility study [20] and the broad goals of the project.

Maneuverability: The manoeuvrability of an airship is described using a right handed, orthogonal coordinate system passing through the airship's centre of volume (Figure 1). If a force acts on the airship it causes a turning moment which is defined as "the product of the magnitude of the force and of the perpendicular distance from the Cv to the line of action of the force" (Beer and Johnston, 1987). The three possible turning moments of an airship are classified as roll, pitch and yaw moments about the x, y and z axes respectively. Control of yaw and pitching moments was part of the project definition, but roll control was not deemed necessary. As almost two thirds of the mass is contained in the gondola any minor roll moments will be counter-balanced by the natural tendency of the airship to move back to the equilibrium position. The rate of turn of the airship describes how fast the airship can yaw. The feasibility study suggested that it would be possible to achieve a 90º turn in 3 seconds. The target rate-of-turn, was therefore 30º/s.

Takeoff: The takeoff manoeuvre describes how the airship moves from the ground to its cruise altitude. The takeoff motion is designed to be entirely vertical, although it is also possible to takeoff diagonally with a small thrust from the side fans. Diagonal takeoff is not an essential part of the project. Two flight parameters needed to be determined so the takeoff mode could be defined accurately. A cruise altitude of 6m was chosen mainly due to a limitation in the ultrasonic height sensors which fail to accurately measure height above this altitude. The time required to reach the cruise altitude also needed to be defined. Preliminary thrust and drag calculations suggested that 20 seconds was an achievable ascent time hence this figure was chosen.

Hover: When the airship does not move in the horizontal plane and maintains its altitude it is in hover mode. Hovering mostly occurs at the cruise altitude. As a safety mechanism, the airship was designed to be slightly less than neutrally buoyant, that is the lifting force is almost that of the overall weight force. Therefore, to hover, a constant upward thrust is required to maintain altitude. The magnitude of the upward thrust will be more closely defined in the detailed design.

Cruise: The cruise mode is essentially the same as the hover mode except that it includes movement in the horizontal plane. Cruise calculations required that two flight parameters be determined. A maximum cruise speed of 1.0 ms-1 was deemed to be achievable based on the initial thrust and drag calculations. The performance of the NUS airship and the Rowan University airship also suggested that this cruise speed was appropriate. To calculate the maximum cruise thrust, the time to reach maximum speed also needed to be defined. A value of 10 seconds was chosen based on preliminary testing of ducted fan units.

Landing: The landing of the airship was designed to be entirely vertical although there is the capability for a descent where horizontal thrust is provided. Since the total weight of the airship is designed to exceed the lift provided by the helium, the airship should descend under its own weight. Descent time from the cruise altitude was designed to be less than 20 seconds. The excess weight calculations will be used to determine the exact theoretical descent time. Summary of Flight Parameters is given in Table 3.

FORCE ANALYSIS

Weight Determination: The exact weight of the airship was difficult to ascertain during the conceptual design phase. Research was done into the weight of every component and an overall weight estimate was made.The

envelope and stabiliser weights were estimated based on discussions with the manufacturer of the envelope, Airship Solutions. They provided information on the polyurethane density and thickness. This was then combined with preliminary surface area estimations to calculate the total weight of the envelope. It was especially difficult to estimate the weight of the gondola housing and internals as the gondola design changed frequently. The balsa wood density and thickness were combined with an approximation of the total surface area of the gondola to estimate its weight. The weight of the motors, ducted fans, batteries, speed controllers and automatic control components was determined from manufacturer data sheets. Parts that were definitely going to be needed in the final design were purchased and then weighed to confirm the manufacturer's data.

Lift Determination: The lifting force is comprised of the static lift from the helium and the dynamic lift created by the pressure distribution around the airship during flight. The envelope is very inefficient in creating dynamic lift due to its shape and the low speed airflow. The dynamic lift was assumed to be negligible compared to the static lift.

Lifting gas: From Archimedes' principle, the upward buoyancy force due to the lifting gas is equal in magnitude to the weight of the fluid (air) displaced. To be effective in generating lift, the density of the gas displacing the air must be as low as possible. The buoyancy force can be expressed as a function of the lifting gas density, air density and the volume.

$$F_{Lift} = (\rho_{air} - \rho_{lifting\ gas})\, g\, V$$

Where

F_{Lift} = Lifting Force (N)
ρ_{air} = Density of Air (kg/m^3)
$\rho_{lifting\ gas}$ = Density of Lifting Gas (kg/m^3)
V = Volume of the Envelope (m^3)

Four alternative lifting gases could have been used for the airship: hydrogen, helium, methane and ammonia. A comparison of the lifting force is shown in Figure 2 and the calculations for each gas are shown in Appendix B. The unit of lifting force was converted to grams for ease of comparison with the mass of components. Figure 2 shows that to lift 3kg of weight using ammonia or methane would require a volume of at least 5m3. Hydrogen and helium provide almost double the lifting force per volume and hence would need a total volume of approximately 3m3. Hydrogen could not be used due to its extreme flammability. Hence it was concluded that helium was the only suitable gas for the airship.

Atmospheric Effects: Temperature, altitude and air density all affect the lifting capacity of the airship. Due to the low ceiling height, any altitude affects were deemed negligible. Air was assumed to be an ideal gas and hence the affect of temperature on the air density can be calculated.

$$\rho_{air} = \frac{P \cdot M}{R \cdot T}$$

Where:

P = atmospheric pressure (Pa)
M= Molar mass of air (kg/kmol)
R= Specific Gas Constant (N m kg^{-1}kmol^{-1})
T= Temperature (K)

The lifting force was then determined at varying temperatures by substitution into the lift equation. The complete solution can be seen in Appendix B. As the airship was designed for indoor use, the temperature would generally be between 15 and 25º C. The maximum operating temperature for the airship was determined to be 35º C (950g of lift

per m3). At higher temperatures, the helium lifting force was insufficient for the airship to fly.

Thrust Determination: Using the flight parameters established in section 3.1 it was possible to calculate the thrust needed in each flight mode. The thrust required was calculated in grams as this is the standard unit used for rating RC ducted fans.

Takeoff: In takeoff mode the airship must overcome the drag force acting downward as well as the weight force. The buoyancy force alone is not sufficient for takeoff, hence an upward thrust must be provided. The required thrust in takeoff was determined from applying Newton's Second Law to the airship. The equation assumes that the buoyancy force is equal to the weight of the airship.

$\Sigma F = m\,(dv/dt) = \text{Thrust} + \text{Buoyancy} - \text{Weight} - \text{Drag}$
$\therefore \text{Thrust} = m\,(dv/dt) + \text{Drag}$

The drag coefficient for the envelope in takeoff was conservatively approximated to be equal to the drag coefficient for a horizontal cylinder moving upward which has C = 1.15 (Munson, 2006). All other variables in the takeoff equation were defined in the flight parameters. The maximum thrust required in vertical takeoff was calculated to be 96g.

Hover: The thrust required in hover was determined using the same procedure as for takeoff mode. As stated in section 3.1, the lift force was designed to be just less than the weight force, hence a constant vertical thrust was required in hover mode. The airship was designed to descend from a height of 6m in 20 seconds. An excess weight of 20 grams was chosen as this allowed the airship to descend in approximately 20 seconds. Hence the constant upward thrust was required to be 20 grams for the airship to hover.

Cruise: In cruise mode, the airship required thrust in both vertical and horizontal directions. The vertical thrust was equal to that needed for hover. The drag coefficient was approximated as an ellipsoid with C =0.38 (Munson, 2006). The drag caused by the gondola was assumed to be negligible compared to the drag of the envelope especially considering the low maximum speed. From the hover force analysis, the constant vertical thrust was determined to be 20g. The forward thrust was calculated by applying Newton's Second Law in the horizontal direction. The required horizontal thrust was calculated to be 130g.

$\Sigma F = m\,(dv/dt) = \text{Thrust} - \text{Drag}$
$\therefore \text{Thrust} = m(dv/dt) + \text{Drag}$

ENVELOPE DESIGN

Structural Parameters: The structure of the envelope could be based on several main designs: rigid, non rigid and semi rigid. Each type of structural design was assessed based on its cost, lifting force efficiency and aesthetics. Rigid airships have an internal framework which maintains the shape of the envelope. Rigid internal frameworks are typically seen in large scale airships such as the giant Zeppelin craft of the 1920's and 30's. Several ballonets containing the lifting gas are located within the main envelope as seen in Figure 7. Separate ballonets containing air are also housed in the envelope. The weight of the envelope, and hence the lifting force, can be controlled by pumping air in or out of the ballonets. For a small airship design, a rigid structure significantly decreases the effective lift and increases the complexity and cost of manufacturing. Non-rigid airships contain no internal framework to maintain the shape of the envelope. Instead, their shape is maintained by the pressure of the lifting gas within the envelope. Larger non-rigid airships typically include a protective outer surface, made from a robust material such as rubber. Small scale designs generally use a single skin of a durable material which has a low

permeability to helium. One disadvantage of non rigid airship is that other components cannot be stored within the envelope. Non rigid envelopes are a simpler, less expensive alternative to rigid envelopes and are commonly seen in smaller airships under 10 metres in length. Semi rigid airships try to include the most desirable features from both rigid and non rigid airships. Semi rigid airships have a non rigid envelope with an internal pressure higher than that of the atmosphere, to maintain their shape. They also have a framework, but this framework in not as extensive as that found in rigid airships and hence the overall weight of the envelope is reduced. The key requirements in the design of the envelope include indoor use and a low cost. A singled skinned, non rigid design is the most suited for this project's application. It is an inexpensive option and has a high lift to weight efficiency. A non-rigid design is also the most appropriate for indoor use as forces due to air currents will be low. This style of envelope is also commonly used by projects of a similar scale and is regularly used in small commercial craft.

Shape and Aerodynamics: Using the knowledge obtained through the feasibly study, five concepts for the envelope shape were developed. These shapes are outlined in Table 3. The concepts were created using geometric formulae for hemispheres, ellipses, cones and cylinders. The aerodynamics, volume efficiency and aesthetics of each shape were then analysed. An aerodynamic analysis of the different shapes included an examination of the frontal area and the streamline properties. Both of these properties affect the form drag of the envelope. Each of the shapes was given a rank (1-5) based on how they compared with an ideal aerodynamic shape. The results of this analysis are shown in Table 4. The results show that the designs which feature taper and/or ellipsoid shapes will produce less drag.

To minimise the lift required it was important to minimise the weight of the envelope. The weight of the envelope was determined from the surface area of the material and its material properties (thickness and density). The optimal shape for the envelope would therefore have the smallest surface area while providing the same volume of helium. Using a constant volume and the geometric formulae for each shape, the surface area to volume ratio was calculated. The results are shown in Table 5. From this table it can be seen that the two shapes with the smallest surface area to volume ratio (and hence best lifting efficiency) are the "hemisphere front with elliptical end" and "different elliptical front and end". Table 5 provides the surface area to volume ratio for all of the envelope shape. The surface area to volume ratio was found to be minimum in case of "different elliptical front and end" shape. This shape was used to develop the final envelope design based on the lift requirements of the airshp.

CONCLUSIONS

The aim of this work was to make a conceptual design for structural and aerodynamics envelope. This methodology for conceptual design for a small airship was found to be very useful shape of design of the airship. It was not only covers the basic aspects of airship design but also governs the various options that can be utilized depending on the user constraints. However, there still lies a tremendous scope for improving the current design from the aerodynamic point of view. Also further work is required for the dtaile design and the fabrication of this airship for this scope of project. Using the knowledge obtained through the feasibly study, five concepts for the envelope shape were developed. The concepts were created using geometric formulae for hemispheres, ellipses, cones and cylinders. The aerodynamics characterstics and volume efficiency of each shape were analysed. It was found from study that "Different Elliptical Front and End" envelop shape was optimal envelope shape. Surface Area to volume Ratio of this shape was found to be 3.4 which is minimum compare with other different type of envelope.

ABSTRACT

Plant gum is a major NTFP in natural forests, it has a significant role in commercial as well as in medicinal industry. Millions of tribal people earn their livelihood from collection and marketing of such plant gums. Odisha is a rich in vegetation of gum yielding plants like, *Sterculia urens* Roxb., *Acacia nilotica* (L.), *Anogeissus latifolia* (DC.) Bedd. *Azadirachta indica* A. Juss., *Lannea coromandalica* (Houtt) Merr., *Boswellia serrata* Roxb. Ex Coleb., *Shorea robusta* Gaertn.f., *Buchanania lanzan* Spreng. and *Aegle marmelos*. In this paper attempts have been made to find out a relationship between the seasonal condition and gum producing capacity of three different plant species i.e. Sterculia urens, *Boswellia serrata* and *Anogeissus latifolia*. The results indicate that the least production of gum has been found in the month of October (6.47 gin *Sterculia urens*, 1.23g in *Boswellia serrata* and 5.32gin *Anogeissus latifolia*) whereas production of gums in those plants reached in its maximum value in the month of June (14.97g In Sterculia urens, 4.4g in *Boswellia serrata* and 12.1g in *Anogeissus latifolia*).

INTRODUCTION

India is one of the 17 mega biodiversity centers of the planet earth having a wealth of forest resources. The variation in soil quality, climate and topology across the country provides a suitable habitat for varieties of plant species and other life forms. It is estimated that the overall forest cover of India is 7,12,249 sq km. which is near about 21.67% of the total geographical area of the country[1], [2]. Apart from providing other ecosystem services (like regulating the climate, nutrient cycling etc.), the forest provides subsistence to a large section of the population of our country. Millions of tribal people earn their livelihood from collection and marketing of Non-Timber Forest Products (NTFPs).

Particularly in developing countries like India, gums and resins provide a significant proportion of NTFPs. Collections of gums and resins provide livelihoods to millions of Indian people living in or around forests.

Gums and resins are basically plant exudations that result partly from natural phenomena and partly by injury to the by insects, animal or human being. Gums and resins are generally exuded by plants in liquid form and on exposure to the environment it gets dry into translucent tears, and remain attached to the bark of the stem or branch [3]. These gums are otherwise known as tree exudates. These exudates (gums) have a historical background of about 5000 years, these are the composition of long chains of polysaccharides having high molecular weight, these polysaccharides are mainly composed of monosaccharide like, uronic acid and some protein and fibers [4].

A large number of gum and resin yielding plants are available in Indian forests, most remarkable among of them are plants *Sterculia urens* Roxb., *Acacia nilotica* (L.), *Anogeissus latifolia* (DC.) Bedd. *Azadirachta indica* A. Juss., *Lannea coromandalica* (Houtt) Merr., *Boswellia serrata* Roxb. Ex Coleb., *Shorea robusta* Gaertn.f., *Buchanania lanzan* Spreng. and *Aegle marmelos*(L.) Corr. [5]. Out of these *Sterculia urens, Boswellia serrata* and *Anogeissus latifolia are* some of the major gum-yielding plant species commonly found in the forest patches of Sambalpur district[3], [6]. Gum of these three plants have a lot of commercial uses in different industrial markets like paper, textile, petroleum and gas industries [7]. In addition to their commercial uses these gums are also used in pharmaceutical sectors. The different physical factors like temperature, humidity, sunshine, moisture, water stress and nutrient availability etc. influence the growth and metabolism of plants seasonally, also influence the production of gums in different seasons.

Coppen et al.1995 through their study have concluded that lower temperature normally leads to a depression in resin yield in pinus plants [8]. Study made by Rodrigues et al. (2009) on pinusplant also support Coppen's statement as they have shown that spring and summer influence more production of resin than winter [9]. Ballal et al. 2008 while studying on the effect of temperature on gummosis on *Acacia senegal*, have reported that high temperature during tapping period is conducive to high gum production while low temperature leads to sealing off of the gum exudation points as a result there is no gum yield [10]. Fahn et al. 1979has done a similar study on seasonal effect on wounding and gum production in Cedrus plant and they have concluded that wounding from April to October, when the temperature was higher and cambium was active, resulted in larger sized ducts formation than the ducts formed by wounding in other months [11].This could be the reason for high gum production during the hot season.

Few studies have also been made in India to see the effect of different season on gum production. The best season for optimum gum and resin collection is March to June when temperature is maximum in the environment [12], high ambient temperature may accelerate gum oozing which also been reported earlier by Bhatt et al 1987 [13]. Trees of Tropical region may show higher gum yielding potentiality. A systematic investigation on the production of gum in different gum yielding plant species in different seasons has become a basic need which will help to make proper planning for development of the best commercial tapping schedule.

MATERIALS AND METHODOLOGY

Study site

Present study has been done in thecommon forest patches of Sambalpur district, Odisha. viz. "Lakhmidungri", "Daridungri" and "Chandlidungri"in the Kamgamforest range, Sambalpur south forest division, Sambalpur. Lakhmidungri(21^0 28′ 24.02″ N to 21^0 45′28.78″N and 83^0 52′ 02.12″ E to 83^0 77′ 45.23″E)with an area covering of 333.34 hectare (average altitude 170 m),Daridungri($22^025'48.66''$ N to $22^039'56.32''$N and $83^052'54.07''$ E to $83^067'55.01''$E)with an area covering 30.12 hectare (average altitude55m) and Chandlidugri ($21^029'15.78''$N to $21^055'43.22''$N and $83^055'44.63''$E to $83^069'54.31''$E)with an area of 415.27 hectare (average altitude220 m) are tropical dry deciduous forestswith tropical monsoonic climate .

METHODOLOGY

In traditional method of tapping wounds were made by axe or some homemade instruments which causes undefined wound formation due to uncontrolled pressure on the stem of the plants and that leads to irreversible damage to the plants [14]. Therefore, in the present experiment a standard tapping tool chisel (2cm. & 5 cm. widths) and hammer (250 g.) were used to form definite size (10cm X 10 cm) of wound by exerting controlled pressure [15]. To ascertain the seasonal impact on gum production, gum trapping was done on the selected plant species during the dry seasons (except the rainy season i,e July, August and September) at monthly interval basis by following the method of Fahn et al. (1979) and Ballal et al. (2009). The gum thus produced from the standard wound at standard height at the right direction in different months were collected, dried and weighed to find out the effect of seasonal variation on gum production [11], [16].

RESULTS

The gum production recorded in different months of the year from all the three different plants i.e. *Sterculia urens*, *Boswellia serrata* and *Anogeissus latifolia* at a previously standardized height (150 cm. from the ground) from standard wound size (10X10 cm.) revealed that the gum can be harvested throughout the year, though at differential amount except the rainy months of July, August and September of a year. Table1 depicts the effect of season on the yield of gum from *Sterculia urens* , *Boswellia serrata* and *Anogeissus latifolia*. Results shows that Sterculia urens has more gum production potentiality followed by *Anogeissus latifolia* throughout the year.The gum production in all thethree plants from the wound was found to increase linearly from January to June (Fig. 1). June inwards in the month of July August and September the gum production was almost nil. Thereafter from the months October onwards the gum production exhibited an increasing trend in all the three plant species. The highest amount of gum produced in all the three species was found in the month of June i.e.14.97g In *Sterculia urens*, 4.4g in *Boswellia serrata* and 12.1g in *Anogeissus latifolia*.

DISCUSSION

The gum production in different months of the year varied significantly in all the three species of plants. In all the species the gum production went on increasing from January -June and it reached its maximum value in June. Thereafter in July-September which is locally the rainy season there was almost no measurable quantity of gum production and whatever minimal amount was produced those were washed away by rain water. After the rainy season (October-December) a slight increase in gum production was observed. The highest amount of gum production during May and June months of the year could be due to the un-conducive environmental conditions (like high temperature, less humidity and water stress) prevailing during this month which favours high amount of gum production. Coppen and Hone (1995), Pio and Valente (1998) and Brito et al (1982) have also reported that lower temperature normally lead to a depression in resin and gum production from plants [8], [17], [18]. The influence of photoperiod cannot be disregarded since ethylene (an inducer of gum production) biosynthesis is induced by light and is circadianly regulated [19].

Transcripts of genes encoding some terpene synthesis have also been shown to follow a weak diurnal oscillation that is under the control of circadian clock [20]. The findings of this study that high temperature at tapping time is conducive to high gum production while a low temperature seems to seal off the gum exudation points resulting in low yield of gum, is in conformity with the report made by IIED and IES (1989)[21].Dione and Vassal(1998) have also reported that peak gum production is apparently stimulated by the onset of drought condition i.e. after in rainy season and air temperature rises[22]. Another reason of high amount of gum production during drier months of the year is due to the presence of higher level of reserve metabolites in plant tissue [23]. This seems to explain why greater exudated yields are obtained during the dry months of May-June than during any other months. Fahn et al.

(1979) have further reported that during the hot and dry months of the year, the cambium remains active and more gum ducts are formed leading to increase in gum production [11]. The reverse happens during the cooler and wet months of the year.

CONCLUSION

From the above investigation on the study of sessional variation of gum yields on three tree species viz.*Sterculia urens, Boswellia serrata* and *Anogeissus latifolia,* it was observed that there is a significant variation on gum yields among the three plants with respect to different seasons. It can be concluded that*Sterculia urens*has significantly more gum yielding potential followed by *Anogeissus latifolia*. while Seasonal variation is concernthat May and June is comparatively best season when the gum yielding is maximum in all the three plants.

ABSTRACT

This is the new survey report in Keonjhar district of Odisha. In consonance with the survey report, we are found in 13 number of species of foliose lichens pertain to 8 genera and 3 families at the place of Salandi, Kanjipani and Champua. The three families are Physciaceae, Parmeliaceae and Arthoniaceae. In these three areas of Keonjhar district, the most dominate tree is *Shorea robusta* (Sal tree) which is much more flourishing foliose lichen and other trees are also carry on foliose lichens correspondingly trees are *Bombax coiba*, *Dalbergia sisso*, *Saraea asoca* and *Delonix rejia*. Above the 13 number of species of foliose lichens are maturing on tree bark. This is the preliminary survey report. Further we are study, we will be achieve more numbers of different types of lichen i.e. Crustore, foliose and fruticose lichens.

Keywords: Foliose Lichen, Kanjipani, Champua, Salandi (Hadgarh sanctuary) Keonjhar district, Odisha, India.

INTRODUCTION

Lichens are the successful symbiotic interact small plant or organisms that have consist of the fungi (mycobiont) in abxial position and algae (phycobiont)in adxical position [1]. Generally we are known lichens are divided is 3 major groups such groups are Crustose, foliose and Fruticose. Foliose lichens are leaf like structure and adhere to their substrate loosely. Crustore lichens are looks like crust and embedded in their substrate. It has no lower attached. In earth, this type of lichens is found in 75%. Fruticose lichens have no distinct top and bottom and its thalli may be upright, shrubby [2].

Accordingly foliose lichens are one of another variety of lichens. Foliose lichens are complex organisms which arise from the symbiotic relationship between fungi and algae. In this lichens lifespan is between 30 to 60 years [3]. Lichens contain a main part of body called the thallus which is composed of hyphae, cortex and medulla. The cortex contains the photosynthetic cells, medulla is gas exchange. Foliose lichens attach to surface by hyphae in the lower cortex with root like structures called rhizines. In environmental case, lichen also major role. Lichen provides a food source for many animals that animals are dears, goats and caribou and also building for bird nests. Some species are used for medicine and also used as indicator of atmospheric. In the case pollution, these lichens are sensitive to sulphur dioxide which is a by-product of atmospheric pollution. Sulphur dioxide reaction with chlorophyll in lichen which is produce in phaeophytin and magnesium ions [4]. In the case of reproduction, these lichens are show two types of reproduction system i.e. sexually and asexually. The reproduction both requires fungi and algae. Reproduction of lichens, the fungal partner must be produce millions of germinating spores which fuse to zygote that found a compatible photobiont. This photobiont fuse with the zygote and create lichen. The fungal partner is ascomytes with spores called ascomata. The lichen of fruiting bodies make up one of two shapes which looks like disk or cup shaped and produce their upper surface which shaped flasks like that is spore producing layer with a hole at the top. Foliose lichen use cylindrical finger like protuberances from the upper cortex which is algal and fungal tissue. They are easily breakdown and spread by wind and they will relocate and propagate forming new lichen [5].

Lichens are world wise distribution. In India is a subcontinent of Asia, it is also rich in lichens which is mostly found in 8 lichenogeographic region such regions are Western Himalaya, Eastern Himalaya and North east India, Western Dry Region, Gangatic plain, Central India, Western Ghat, Western Ghat and Deccan Plateau, Andaman and Nicobar Islands. In world wise reported 20000 species of lichens found and the subcontinent of India also carry 2450 species of lichens and more than 2300 species of lichens only Indian possesses [6].

The mega diversity of India which is more than 10% of total world lichen species hold about 2303 species belong to 305 genera and 74 families widely distributed in tropical, sub-tropical, temperate and alpine zone of India [6].

Odisha is state of India which is located within the latitudes $17^0$78/N &$22^0$73/ and longitudes $81^0$37/&$87^0$53/. The state of Odisha is bounded by West Bengal on the North east, north side is Jharkhand, Chhattisgarh is west side, Andhra Pradesh is south side and the east side is Bay of Bengal. The costal line of Odisha about 450kms and the total area of Odisha are about 1, 55, 707km2.The state of Odisha which is contain 252 speciese of lichens belongs to 81 genera and 35 family that is 49 species of Graphidaceae, 21 species of Arthoniaceae, 19 species of Pyrenulaceae, Parmeliaceae (18), Trypetheliaceae (17), Physciaceae (15), Teloschistaceae (14), Lecanoraceae (13), Pertusariaceae (12), Ramalinaceae (11), Caliciaceae (11), Thelotremataceae (9) and Lecidiaceae (4). The Graphidaceae family of genus Graphis which ig dominat 27 species in the stat of Odisha followed by Pyrenula (16), Caloplaca (14), Pertusaria (12), Lecanora (10), Parmotrema (9), Cryptothecia (9) and Pyxine (6). The most of lichens are found in Mayurbhanj district which is 141 species and followed by Jharsuguda 31 species,Ganjam 21 species, Gajapati (7), Dhenkanal (5), Koraput (3), Khordha (3), Puri (1), Sambalpur (1) and Sundergarh (1). Most of 20 districts are complitely uninvestigated for lichens. Only 10 districts are found in 252 species of lichens [7]. Some of species of lichens are identified by Keonjhar district. The briefly describe in foliose lichen in different host plant at Keonjhar district.

MATERIALS AND METHODS

STUDAY AREA

Keonjhar district is an administrative district of Odisha. It has three sub- divisions i.e. Anandapur, Champua and Keonjhar. Keonjhar district is occupied area 8240km^2 and longitude $86^0$21/ E & latitude $21^0$59/ N. Keonjhar district maximum temperature is 38^0C to 43.3^0C and minimum temperature is 1^0C to 7^0C. According to weather forecast department, in November & December minimum temperature is 1^0C. Keonjhar district annual rain fall is 1910.1 mm

recorded. Among the Keonjhar district, we are selected three sides- Salandi (Hadgarh sanctuary), Kanjipani and Champua then go to these three areas and watch it and study clement condition and other environmental study with site or area location. Salandi forest is situated in Anandapur, district of Keonjhar, Odisha. It is located in latitude 21.289335^{0}N and in longitude 86.320443^{0}E. Hadagarh Wildlife Sanctuary is dense forest which is constituted in Sal trees i.e. the dominate trees of this Sanctuary which is established in 1978 and it's covered in 191.6 sq. km. Salandi forest is linked to Similipal Tiger Reserve and with Kuladiha Wildlife [8]. Champua is situated in sub division of Champua which is district of Keonjhar, Odisha. Its Latitude is 22.0800N and longitude is 85.6700E and in this area clement is moderate and it has an average elevation of 346 metres. Kanjipani Ghati is situated in Keonjhar district. This area spreading about 20km along NH- 49, from Kanjipani to Jagamohanpur and about 8km along Telkoi road i.e. Kanjipani to Panassanasa. Kanjipani Ghati is located on longitude 85.4608^0 E and latitude 21.4705^{0}N. In this area temperature is 0^{0}C in winter and rainy season but summer season temperature is about 25^{0}C to 30^{0}C. So, in this area is less pollution and lichens are well growth in this area. Kanjipani also carry a vast area of flora and fauna and with Huge Wildlife reserves.

COLLECTION, PRESERVATION AND IDENTIFICATION

The lichens are divided two groups i.e. micro and macro lichens. So, commonly visible micro and macro lichens for our naked eyes. First watch the micro and micro lichens then start digging it by the equipment of a long sharp fat edged chisel (1 to 2 inch.) and a hammer (1 to 2kg weight) with GPS that is use for location and pan and paper due to wright some information i.e. name of area, note of location and note of trees name with date and also take camera for click photos for macro and micro lichens with trees. In this way collected lichens then start next process that process is preservation. So, preservation processes are first collected lichens or samples are put out the carry bag then this samples dry by heat air or sun light with in 24hours then pressed by herbarium pressure due to simples are not bend, within 2 to 3 days. After 2-3days, the samples are ready to identification, so, 1st make some packet that colour is white or brown, then put on the specimen or samples or lichens and wright down some information that is name of area, date etc. After all this work is complete then starts next process that is identification. Lichens are identified by morphological and anatomy of thallus structure and mode of reproduction [2] by using available of standard keys[9, 10, 11, 12, and 13]. One method used for identification in lichens consists of some spot test. It is based on three chemical tests that may or may not yield a colour change when applied to lichen. Now a day thin layer chromatography (TLC) is the most widely used method for identification of lichens. Then extracts of the unknown lichens are spotted on a TLC plate. Picture 2 a,b & c representing the growth of foliose lichens in different host i.e. tree substratum.

RESULT AND DISCUSSION

According to survey report, we are found in 13 species of foliose lichens which belongs to 8 genera; there are found in various parts in Keonjhar (Salandi, Kanjipani and Champua). This survey report is based open the foliose lichen in diversity host. These are level in following table.

Serial Number	Name of the tree	Family	Lichens name	Type of lichens	Growth area
1	*Delonix rejia*	PARMELIACEAE	*Parmotrema reticulatum*	Foliose	Champua
2	*Shorea robusta*	ARTHONIACEAE	*Dirinaria applanata* var. applanata D.D. Awasthi.	Foliose	Salandi(Hadgarh sanctuary)
3	*Shorea robusta*	ARTHONIACEAE	*Dirinaria consimilis* (Stirt) D.D. Awasthi	Foliose	Salandi(Hadgarh sanctuary)
4	*Shorea robusta*	PARMELIACEAE	*Bulbothrix isidiza* (Nyl.) Hale	Foliose	Kanjipani

5	*Shorea robusta*	PARMELIACEAE	*Myelochroa xantholepis* (Mant. & Bosch.) Elix	Foliose	Kanjipani
6	*Shorea robusta*	PARMELIACEAE	*Parmotrema andium* (Mull. Arg.) Hale	Foliose	Champua
7	*Shorea robusta*	PARMELIACEAE	*Parmotrema ravum* (Krog & Swinscow) Serus	Foliose	Champua
8	*Saraca asoca*	PARMELIACEAE	*Parmotrema tinctctorum* (Despr. ex. Nyl.) Hale	Foliose	Champua
9	*Dalbergia sissoo*	PHYSCIACEAE	*Pyxine coccifera* (Fee) Nyl.	Foliose	Salandi(Hadgarh sanctuary)
10	*Shorea robusta*	PHYSCIACEAE	*Heterdermia pseudospeciosa* (Kurok.) Culb	Foliose	Kanjipani
11	*Bombax ceiba*	PHYSCIACEAE	*Heterdermia obscurata* (Nyl.) Trevis	Foliose	Kanjipani
12	*Shorea robusta*	PHYSCIACEAE	*Heterdermia diademata* (Taylor) D.D. Awasthi.	Foliose	Kanjipani
13	*Bombax ceiba*	PHYSCIACEAE	*Heterdermia albidoflava* (Kurok.) D.D. Awasthi	Foliose	Kanjipani

(**The above table shows the categories of host plant in grow family of foliose lichens that is Physciaceae which is found in more number and also Heterdermia species of lichens growth in more number in these three areas.)**

Three families are Arthoniaceae, Parmeliaceae, and Physciaceae. This foliose lichen is growth in different site of Keonjhar district that sites are Salandi, Kanjipani and Champua. We are observed, the Sal trees are dominating tree in Keonjhar district which is suitable host body for lichens growth and also observed Kajipani is one most wonderful place which contains more number of foliose lichens i.e. 6 numbers of foliose lichens then Champua contain 4 numbers of foliose lichen and Salandi contain 3 numbers of foliose lichens. In these 3 sites, the 13 numbers of foliose lichens are *Dirinaria applanata, Dirinaria consimilis, Anisomeridium terminatum, Bulbothrix isidiza, Parmotrema tinctctorum, Parmotrema andium, Pyxine coccifera, Heterdermia albidoflava, Heterdermia pseudospeciosa, Heterdermia obscurata* and *Heterdermia diademata*.

In the above graph (Fig-3) foliose lichens grow on this trees such trees are*Shorea robusta, Bombax ceiba, Dalbergia sissoo, Saraca ascoa,* and *Delonix rejia*. The relationship between lichen and tree is commensalism that is one organism benefits form the association and another is neither positively nor affected. So that lichen is use tree as structural roosts. Lichen is a unique organism that a symbiotic relationship between algae and fungus. We are known fungus are grow on trees at that time fungus are collect moisture that is helpful for the algae. Then the algae can produce food by the help of sun light which feeds the fungus.

Form above pic-chart (Fig- 4) shows that the different geo-graphical region of Keonjhar District (Salandi, Kanjipani and Champua). Kanjipani is suitable place for growing more number of foliose lichen (46%) carry on because this area has less pollution and suitable climate condition for growth in lichens. Then Champua also carry on 31% of foliose lichens as well as Salandi (Hadgarh sanctuary), also carry on 23% of foliose lichens. Form above pic-chart (Fig- 5) shows that, the distribution of lichen family. The Parmeliaceae (48%) family have highly distributed in foliose lichen then Physciaceae (39%) which is moderate distributed and Arthoniaceae (15%) which is quit listed number of distribution in Keonjhar district.

CONCLUSION

From above preliminary study, we conclude that 13 numbers of foliose lichen species are distributed into Salandi, Kanjipani and Champua in the Keonjhar district. These lichens drivers from tree bark that trees are *Shorea robusta, Bombax ceiba, Dalbergia sissoo, Saraca ascoa,* and *Delonix rejia.*

ABSTRACT

In this paper design and simulation has been carried out for 8*8 multiplier circuits using the Modified Gate Diffusion Input (MGDI) based adder cellusing Digital Schematic (DSCH3) CAD tools and their simulations are generated by Micro wind 3 CAD tool. Further the performance assessment comparison of multipliers were made.Adder has been known to be the basic building block of all arithmetic operations, thus the focus is also to optimize the adder circuit that can be implemented in different multiplier algorithms and to compare their results in terms of area, operating speed, power consumption and transistor count.

Keywords- MGDI modified GATE diffusion technique, CAD-computer aided design

INTRODUCTION

In VLSI design configuration, the rapid development of convenient electronic gadgetwith limited power and area ha s opened up a wide range of chances and difficulties for less power and small circuit design.Multiplication is a key function in arithmetic logic operation, imageprocessingandinDSPalgorithms.Andso it is desirable to make low power, highspeed multiplier circuits for these operations. This multiplication often uses the adder circuits. Various types of logic are suggested for high speed and less power consumption, and every sort of logic has its own advantage and disadvantage in terms of power consumption and speed. MGDI is defined as one of the alternative logics that can boost the efficiency of the circuits .using a single pair of transistors (one NMOS and one PMOS),a

wide range of logic functions can be realized in MGDI technique. This leads to reduced power and area compared with current CMOS technology.[1].Input 'G'is the PMOS and NMOS shorted gate terminal,'N' is obtained from the NMOS source terminal and 'P' is obtained from pmos. Body terminal of PMOSis connected to V_{dd} and NMO Sis connected to Gnd respectively. Table 1 shows the various functions that can be obtained using this MGDI cell. In fact, these functionshave been mentioned in table 1 require 6 to 12 transistors to be implemented using CMOS, But with one pair of transistors, can also be implemented.Table II reveals comparison of the transistor numbers for different functions [2].

In the present paper, a new adder cell is proposed to implementan8 ⊙ 8 bit multiplier circuit. Our proposed cell is designed using a combination of both the MCIT and the Shannon technique. This paper describes the design of an adder cell for digital applications, such as those used in DSP algorithms and cryptography. The proposed adder cell is applied to implement three different types of 8 ⊙ 8 bit multiplier circuits: namely a Braun array multiplier, a CSA array multiplier and a Baugh–Wooley array multiplier. These multipliers are designed using CAD tools such as DSCH2 for logic design and Microwind 3 for the layout design and timing simulation. METHODOLOGY

Design and Architecture

The following multipliers are designed in 0.35 μm as well as 0.25 μm design sizes using the DSCH2 and Microwind VLSI CAD tools:

1.Carry save array multiplier .

2. Braun array multiplier.

3.Vedic multiplier

Carry Save Array Multiplier

Carry save array multiplier is suitable for both signed and unsigned numbers. To aggregate the partial product it uses a variety of carry-save adders. The multiplier utilizes a carry-propagate adder for the finished product. This decreases the basic path delay for the multiplier, as the carry-save adders pass the carry to the next degree of adders rather than nearby ones. Figure 2.4 shows the 4 * 4 carry save array Multiplier architecture[10]. Consider the two binary numbers to be multiplied by X and Y. Where X is the multiplicand, and Y a multiplier.

$X=x_{n-1}x_{n-2}x_{n-3}\ldots\ldots x_1x_0$

$Y=y_{n-1}y_{n-2}y_{n-3}\ldots\ldots..y_1y_0$

$P(product)=p_{2n-1}p_{2n-2}p_{2n-3}\ldots..p_1p_0$

Half adder, full adder and the AND Gate blocks have been in use incarry save multiplier architecture.

Braun array multiplier

Braun Array is a simple parallel multiplier, consisting of AND gates and carrying save adders as shown in the figure below.For an N*N Braun array multiplier, the number of AND gate required is N^2 and no of carray save adder required is N*(N-1).Partial products are created in parallel using the AND gates. Partial products are added with the sum of the previously generated carry save adder output using adders in rows. The final phase output is obtained using the ripple carry adder [9]. This multiplier preferred for positive operands.Figure 4 liststhe Braun algorithm for non-signed binary multiplication

Vedic multiplier

Vedic mathematics helps with less delay in quick calculation, because in Vedic mathematics the algorithms are based on human mind interpretation. There are various multiplicationmethods are there in Vedic mathematics. Among them the Urdhvatiryagbhyam, as a basic rule for multiplication, it applies analogously to all forms of multiplication.This boosts speed and area of multiplication by significantly.

Implementation: Adder design

Half Adder designing using MGDI

The half-adder circuit takes two inputs as augend and addend bit, and produces the output as a sum and carry. The sum output and the carry output shall be expressed as SUM = A⊕B and CARRY = A.B.The figure below shows half-adder design with MGDI technique.

Full Adder Designing using MGDI

The full adder is a combination logic circuit which uses 3 bits as inputs to add and produce the sum(s) and carry(c) as output along with a previously produced carry.The proposed adder cell using modified gate diffuse technique MGDI , with 8 no of transistor is shown in below figure.

Multiplier design

Proposed adder cell can be applied for making multiplier circuits.Half adder and full adder circuit were designed at first and the output is checked.Afterthat library module for these cell was made which isdirectly used in the design of multiplier circuits.Fig.9 demonstrates the Carry save array multiplier being implemented in DSCH3 and the output is displayed on the led display.

Vedic multiplier

With the MGDI adder cell and 4*4 multiplier as building block,8*8 multiplier is designed in DCH3.

Comparative Analysis of Multiplier Circuit

Three types of multiplier circuits have been designed and evaluated using digital schematic DCH3 VLSI CAD tool and the performance evaluation are done in Microwind3 .The parameter like power dissipation, critical path delay and area occupancy is obtained for 0.12um and0.32um feature size technology. The simulated result for the 8*8 multiplier circuit is compared in the given table 2&3.

CONCLUSION

The 8*8different multiplier algorithms such as Carry Save Array, Braun Array and Vedic multiplier with MGDI technique in 120nm and 320 nm is designed using DCH3.for performance ,among them the Vedic multiplier gives the optimal results with regard to total chip area, power dissipation, delay and total transistor count .

ABSTRACT

In this present investigation which was layout to examine the internal and external egg qualityattributes of indigenous chickens of five phenotypes. The study was carried out at Centurion University, poultry farm, in the Department of Zoology. The research drudge for a period of two months. Ten eggs of each phenotypes were collected randomly for the study. Fifty egg in total were possessed for the study. For determination of parameters instruments like digital electric balance, Micrometer screw gauge and Vernier calliper were made used. Egg width, albumin height and width significantly ($p<0.001$) differ among the phenotypes. A significant difference ($p<0.001$) differs in the egg width, albumin height and width. Except Haugh unit other egg quality attributes were significantly affected by the type phenotypes. SimilarlyVanaraja have the highest egg weight, egg volume, egg width and yolk weight. But in V_2 chabro have the lowest egg weight, egg volume, albumin length, albumin height, yolk length, yolk height. Red Cornish have the highest moisture content, while black rock have the highest protein content and Dhelem red have the higher lipid content than other indigenous species. Energetic value content more in V_2chabro and highest carbohydrates present in Red Cornish.So the objective of present study is to provide information about the comparative physicochemical characteristics of eggs of different layers which includes different strains of Gallusgallusdomesticus

Keywords: Phenotypes, egg quality, Vernier calliper, Digital electric balance, Sphaerometer**,** Screw gauge

INTRODUCTION

Eggs are highly accomplished food consisting vital source of fibres useful for maintaining human health. Eggs produce a unique and well balanced nutrient for all ages. The connotation of proteins in animals present in plentiful and equitable substances is considered for the human affluence with beneficial to mental and physical advancement

[1]. Between aforementioned such animal protein sources, the poultry animals have an important place for the meat and egg production. The productiveness and distinctive attributes of breeding eggs have an overall implication for the progression of flocks and for an economic breeding [2]. The nutritional composition of eggs of different species of birds may be similar in terms of nutritious composition. Nonetheless, facts about the egg quality traits and its application in food and other industry are restricted mainly to hen's eggs. The egg quality that influences its reliability to consumers are weight of egg, the quality of shell, the yolk and albumen index and most acceptable quality i.e., its freshness of eggs as well as its proximate composition [3-4]. Quality of the egg is the main price determining factor in table and hatching eggs. Chicken eggs have been very competently analysed for its external and internal qualities as well as its admixtures. Hence, this study presents a comparative analysis of the morphological structure and chemical constitution of eggs of chicken species which have economic as well as considerable nutritional value.

MATERIALS AND METHODS

The eggs of turkey and chicken used for this study analysis were assembled from the farm of Central Poultry Development Organisation (CPDO), Bhubaneswar. The eggs were assembled on the day of fling down in the month of November, 2018. During laying time, the chicken were 275 days old. The bird were nurtured under farm conditions on the chicken specialized dietary suitable for chickens.

Evaluation of egg quality

The external characteristics of egg like egg weight was measured in an analytical balance of Dhona – 200 (AB-204) after cleaning and parched with towel to remove contaminants from shell. The egg length and width were measured with a Vernier calliper in centimetre and egg shape index was obtained by the following formula.

$$\text{Shape index} = \frac{\text{Width of egg}}{\text{Length of egg}} \text{ x } 100$$

To examine the internal egg quality characteristics each egg samples were ruptured on a flat white title by taking precautions for not breaking the vitelline membranes which encloses the yolk. The parameters measured were as follows.

a) Yolk width was measured as the widest horizontal circumferences with a Vernier calliper in centimetres.
b) Yolk height was measured as the height of yolk at the midpoint with a tripod micrometre.
c) $\text{Yolk index} = \frac{\text{Height of yolk}}{\text{Width of yolk}}$.
d) Albumin heights were measured from at least three places each with tripod micrometre (Froning and Frank, 1956)[5].
e) Albumin width was measured as the widest horizontal circumference of the thick albumin with a Vernier calliper in centimetre.
f) $\text{Albumin index} = \frac{\text{Height of albumin}}{\text{Width of albumin}}$.
g) Shell thickness of dry egg shell was measured with a micrometre screw gauge. The average of three points (the broad, middle and narrow) were taken as shell thickness.
h) Haugh unit was determined using the following formula.

$HU = H + 7.57 - 1.7\ W^{0.37}$

Where HU = Haugh Unit
H = height of albumin (mm)

W = weight of egg (g)

Individual Haugh Unit (Haugh, 1937)[6] score was calculated using egg weight and albumin height (Doyon et al., 1986)[7]. The mean values were calculates for each trait, according the Snedecor and Cochran (1994)[8].

i) Subsequently, the yolk was segregated from albumin and measured. The weight of shell was measured after the removal of remaining albumin with water and rapid sun drying for six hours.

j) The weight of albumin was evaluated by subtracting the weight of yolk and shell from the weight of whole egg.

Chemical Analysis

Chemical analyses were carried out in two accredited laboratories namely the Feed Analytical laboratory of Central Poultry Development Organisation (CPDO) and Zoology Laboratory of Centurion University of Technology and Management located at Bhubaneswar.

In the laboratories the eggs were kept in refrigerator at 4^0C and analysed with in four days after laying. Analyses were carried out in two categories, i.e., with shell and without shell.The parameters namely energetic value, carbohydrate, cholesterol, crude protein, crude fat (lipid), moisture content, total ash, calcium and phosphorus content were determined. The cholesterol content was analysed enzymatically by using Coral Diagnostic Cholesterol Reagent as described by (Allain et al., 1974)[9]. The crude fat content was analysed by Soxhlet Extraction method as described by AOAC (1990)[10]. Similarly crude Kjeldahl method the moisture content protein was estimated by multiplying 6.25 to nitrogen content obtained by Micro- was determined by drying at 100-102^0C for 16 to 18 hours as described byAOAC (1990)[10] and ash content was analysed by incineration in muffle furnace at 550^0C.

Calcium was analysed by potassium permanganate titration method (Tee et al., 1987)[11] and phosphorus content was determined by colorimetric method using ammonium molybdate solution as described as AOAC (1990)[10]. Energetic value and carbohydrate were calculated computationally using the following formula as followed by (Matt et al., 2009)[12], i.e., Kcal/100gm of edible egg =(gm protein x 4.63) + (gm lipids x 9.02) + (gm carbohydrate x3.87)and 100% - (protein% + fat% + humidity % + ash%) respectively.

Statistical analysis

The data were analysed as per standard statistical protocol (Snedecor and Cochran, 1994)[13]. The different egg quality traits and chemical composition of eggs of both the species were studied and the mean was analysed using the t-test. Values of nutritional parameters were compared and standard error of mean were calculated using t-test and significance of test was calculated ($P < 0.01$) at 1% level.

RESULTS

External egg qualities

Generally eggs of birds have elliptical shape with small differences among species. In spite for small differences, the egg shape is considered to be an important factor in characterizing avian species. In this study, eggs of chicken showed an elliptical shape with having a rounded sharp end. The colour of chicken ranged from white to light brown. The shape of the egg is expressed in terms of shape index and the shape indices of chicken with significant statistical difference ($P < 0.01$) (Table 1). The weights of chicken egg and their components are recorded (Table 1). The Vanaraja egg weight was much higher than that of V_2 chabro egg. The proportion of yolk and albumin to the weight of whole egg are significantly higher ($P < 0.01$) in V_2 chabro (Table1). The shell of V_2 chabro egg was observed to be significantly thicker 0.047cm than the Red Cornish egg 0.040cm.

Interior egg qualities

The yolk index, albumin index and Haugh Unit of the eggs of V_2 chabro were found to be significantly higher ($P < 0.01$) (Table 1). Analysis of chemical composition of different indigenous species of chicken showed significant

differences (P < 0.01). The moisture content of Red Cornish showed highest with 77.64 while black rock have the highest protein content of 11.56 and the Dhelem red have the highest lipid content of 11.92. The energetic content value of V_2 chabro was highest than other indigenous species with 178.92 (kcal/100g) and Red Cornish has the highest carbohydrate content of 6.96.

DISCUSSION

The shape indices in the present study were higher than those reported by some authors for Vanaraja egg [14].The absolute weights of albumin ,yolk and shell weight were recorded to be significantly higher in V_2 chabro than that of other indigenous species. Since yolk index and Haugh Unit are indicators of internal egg quality and those were reported to be higher in V_2 chabro eggs, hence eggs of these species are of better quality. The higher the Haugh Unit and yolk index, the more desirable is the internal quality of the egg [15-18]. The prominent chemical compositions in the present study of chicken egg were similar to those obtained by USDA, (1983)[19] where the moisture content, crude protein crude fat and ash content were 74.57% , 12.14%, 11.5%, 0.99% respectively which is comparable with the present study.

CONCLUSION

Egg composition is not a uniform attributes and depends on many factors such as the hen breed and age. In the present study all the five indigenous species of Gallus gallusdomesticus produced eggs of acceptable external and internal quality. HoweverVanaraja have the highest egg weight, egg volume, egg width, and yolk weight. But in V_2 chabro have the lowest egg weight, egg volume , albumin length ,albumin height, yolk length, yolk height. Red Cornish have the highest moisture content, while black rock have the highest protein content and Dhelem red have the higher lipid content than other indigenous species. Energetic value content more in V_2chabro and highest carbohydrates present in Red Cornish. In developing countries, rural poultry farming are of high importance in terms of maintenance for people living. It provides them not only the food but also at considerable amount offers the opportunity of economic support. In past the rural eggs were primarily consumed by the local people, but now a day's people from other areas tends to consumed these products. It is a known fact that rural products are one of the top rank probably due to high nutritive value for almost all age groups, an important iron source for children and a low caloric and easily digestible nutrition for adults. Rural eggs were found with higher egg shell, higher egg yolk weight and higher haugh unit and can be considered as with high nutritional value as compared to commercially produced eggs[20].

ACKNOWLEDGEMENTS

The authors are grateful to the Director, Central Poultry Development Organisation, (CPDO), Bhubaneswar for the kind permission to use the facilities at the poultry unit of CPDO Bhubaneswar for this study and Dept. of Zoology, Centurion University, Bhubaneswar for their cooperation and support in completing the study.

ABSTRACT

The present study was intended to carry out induced breeding of gold fish (carassius auratus) in controlled environmental condition by administering ovatide, pituitary Extract and mixture of both synthetic and natural hormone at different doses. The study was conducted during the period from June to February 2020 at Department of Zoology, S.C.S (A) college, Purifor 9 months. Gold fish brooders were exposed to single dose of Ovatide @ 0.35ml/kg body weight for both female and male for induced breeding. Fecundity and hatching rate of eggs was found to be significantly higher in mixture of both natural and synthetic than the fish exposed to natural breeding and synthetic. Also, the survival rate was found to be higher in induced bred fish treated with the mixture of both natural and synthetic hormone. The hatching rate and survival success of eggs may be affected by various factors, such as temperature, water quality etc. Therefore, the optimum physio-chemical parameters of water was maintained and monitored during the entire experimental duration. The positive response of gold fish to synthetic hormone (Ovatide+pituitary) with significantly increased fecundity, fertilization and hatching rate makes it possible to conduct the breeding of this species commercially and the method can be utilized to help the farmers to increase theireconomy.

Key words: carassius auratus, Induced breeding, brooder, fecundity, hatching ovatide.

INTRODUCTION

Aquaculture is a booming sector which provides vast opportunities for entrepreneurship and livelihood generation. Ornamental fish form an important commercial component of aquaculture, providing for aesthetic requirements and upkeep of the environment. Aquarium keeping has been an age-old practice and now it is the second largest hobby in the world[1]. Introduction of civil aviation after the Second World War expanded the hobby to a global industry

[2]. In India, the concept of aquarium and aquarium fish keeping has been a practice since long, popularized mainly by the Britishers through inclusion of exotic varieties. Presently it's gaining popularity and almost every house-hold is keen to keep an aquarium in urban areas. Introduction of Chinese Vastusastra (Feng-Shui) in India adds the demand of ornamental fishes especially Gold fish which is one of the oldest and most popular hobbies in the world for ornamental fish lovers. The trade in ornamental fish has been increasing since 1980's.

Organized trade inornamental fish production depends upon assured and adequate supply of demand whichi spossibleonly by mass production through induced breeding. Induced breeding is a technique where organism is stimulated by particular hormone or other synthetic hormone or by providing condition. The stimulation promotes timely release of sperms and eggs from ripe gonads. For the first time goldfish was bred by administering human chorionic gonadotropin (HCG) in India by (Reddy et al. (1990[3].A common method used for induced breeding in fish is administration of pituitary extracts from a mammal or a fish or use of synthetic hormone [4] Goldfish is the highest traded variety not only from the standpoint of the ornamental fish trade but also as experimental test animals as it is can successfully adapt to environmental condition [5]. The present study was undertaken to develop the induced breeding technique for C.auratus using synthetic hormone, pituitary extract and mixture of both.

MATERIALS AND METHODS

Profile of the Study Area

The experiment was conducted in Zoology Laboratory of S.C.S (A) COLLEGE, Puri, under Utkal University. All preparation needed for induced breeding of goldfish were done in the laboratory. Aquarium set up, water supply facilities, working space etc. were assured before the breeding program. The experiment was done from July2019 to February2020.

Materials Requirement

1. Brooders
2. Synthetic fish breedinghormone
3. Insulin syringe
4. Woolrope
5. Aquarium
6. Small plastictop
7. Artificial greenplants
8. Potassiumparamagnet
9. Aerator
10. Air stones
11. Scoop net
12. Plankton net
13. Aquarium heater
14. Thermometer
15. PHpaper

Preparation of Rearing and Spawning Tank

For induced breeding glass aquarium was used for rearing of fish. One large size glass aquarium (4×1.5×1.5ft) were made and 1 small size plastic bath top of the laboratory were used. The aquarium was supported with filter, stone, continuous air-pump etc. The broods were conditioned in the large tank and after injecting the brood set were separated in the small bath top. After fertilizing the fertilized eggs were also kept in the smalltop.

Preparation of Spawning Top

Small top was prepared for spawning pool, so first it was washed with potassium paramagnet. The top was decoded with artificial plants and some rope, colorful stone, provide aeration by the help electricalaerator.

Experimental Design

There were two broad parts of the activities in this experiment. The first part of the activity concerned with the collection of brood fish. The second part of the experiment was performed in the zoology laboratory to carry out the induced breeding program, embryonic and larval stagedevelopment.

Brood Fish Selection, Collection and Conditioning

Mature healthy comet, fantail, gold fish brooders (90-150 g), were selected by sexual dimorphism for breeding experiments. The brood fish were selected on the basis of size and color pattern. Female is usually easier to spot, as the belly of a mature female is generally plump, whereas male remains streamlined and moretor pedoshaped. When males are ready for spawning, they develop breeding tubercles on the head and pectoral fins, principally along the bones of the fin rays. These are used during breeding, when the male nudges the female with its head and fins to induce her to spawn. 3 pairs (4 male and 2 female) brood fishes were collected from the local aquarium fish market and from the aquarium fish market of Puri and Berhampur. To increase the diversity among the parents and to select healthy brood fish, it was collected from the diversified sources. Avoiding inbreeding problem was also a major objective of selection of brood fish from diversified sources. The brood fishes were carried to the laboratory within 12 hours and kept in the aquarium (4×1.5×1.5 ft.). The brood carrying pack was submerged into the aquarium water for 10 minutes. Then the brood were unpacked and released into the well aerated aquarium (D.O: 4.5-5.5mg/L, pH: 7.2-7.4; temperature: 20-230C). The brood was kept 6-7months here before the breeding program.

Brood Stock Maintenance

Brood fish were stocked in big aquarium tanks (120ltr capacity).Before releasing into acclimatization tank, fishes were quarantined in 1ppm KMnO4 solution. Fishes were fed with supplementary feed (38% protein) at 5% of body weight twice a day, along with supplementary diet, brooders were fed earth worm on every alternative day to enhance maturity in captivity. The brood- stock was conditioned in 7-month period with intensefeeding.

Water Quality Parameter

To get optimum survival and production of aquarium fishes during the experimental period, water quality parameters were maintained at an optimum level as required for gold fish.(Table-1)

Induced Breeding

The selected broods collected from the conditioning aquarium were kept on separate aquarium. Continuous air flow was provided in the tanks by aerator. The sex ratio of the spawners was kept at 4:2 for male and female. The breeding program was conducted by a synthetic hormone (ovatide) administration. The selected brood was weighted in the electric balance and then the hormone was administered. The breeding set was released into separate top after the hormonaladministration.

Hormone Dose Optimization

For induced breeding synthetic hormone (Ovatide) was injected to the spawners was bought from the market. The supernatant solution of hormone was then taken for the injection. Both male and female was given single doses of injection. Both injected at the same time. The doses used in the two different sexes were listed inTable.

Method of Injection

Holds the fish firmly and inject the calculated amount of Ovatide solution intramuscularly inthe region of the caudal peduncle above the lateral line using an insulin hypodermic syringe having 40 units. Draw only required amount of Ovatide from the vial directly through the syringe and expel the trapped air, if any, with needle pointing upwards before giving theinjection.

Courtship and Spawning

After administration of Ovatide released into the spawning top. The courtship behavior was observed after 1-8 hours of hormone injection at the bottom of the breeding tank. Active participation was seen by both male and female. During mating splashing of water was observed frequently with dorsal fins seen above the water surface. Males release the milt by rubbing their body against the female by aligning on either side of the female. The adhesive eggs were deposited on submerged spawning top and were fertilized externally. Goldfishes are generally not good parents and they donot exhibit parental care, were separated from spawning tank soon after; hence brooders spawning.

Fertilization

Healthy goldfish eggs look like small, clear bubbles and can range in color from white to yellow-orange. They are also EXTREMELY sticky. The eggs are fertilized, look for tiny black specks in the eggs after the two or three days or so. Those are the eyes of the tiny fry developing inside. This is a3-day old (fertilized) goldfish egg**.** In 3 to 4 days, the eggs hatch (depending on the temperature).

RESULTS

The efficiency of hormone-induced was estimated based on parameters like fecundity, fertilization rate, hatching and survival of larvae. [6]

Gestation Period

After the eggs have attached, they hatched within a short time. If the water is warm, the eggs will hatch a couple days after being laid. If the water is still cold, the eggs may sit for a while, developing more slowly. Most of the eggs will hatch 2 to 7 days after laying.

Raising Goldfish Successfully Starts by Creating Ideal Conditions for Hatching

The Correct Temperature Is Important

The eggs should be kept at a temperature of between 70-75oF (21-24oC). At this temperature the eggs will hatch in 4 days.

Aeration Controls Surface Scum

The eggs should be aerated to ensure adequate oxygenated water is flowing around the eggs. The aeration also helps break up any scum that forms on the surface of the water.

Egg Development

After about 2 days should start to see eyes of the fry appearing. Two days laterthe fry starts to break out of their egg shells.

DISCUSSION

Induced breeding is one of the most viable techniques to cater to the ever-increasing demand of ornamental fish all year round. Wide use of synthetic hormones for induced breeding has yielded a reasonably good degree of success. In the experiment, C.auratus was successfully bred in captivity by the administration of ovatide. The present study indicates that using Ovatide at 0.35ml/kg of body weight of female is the ideal dose for inducing C.auratus in captivity. The present study also shows that fish treated with mixture of both synthetic and natural hormone increases fecundity, fertilization and hatching rate. In the present case better results were achieved with a single dose of injection. It was observed that the eggs of goldfish which were 0.8-1.1mm in diameter, were very much adhesive in nature and hatched in approximately 60- 65 hours at 25Oc.It also revealed that the colour of fertilized eggs was

initially transparent but slowly turned creamy as embryonic development gathered momentum. The yolk sac was fully absorbed after 60-65 hours at 24-25oCin case of C.auratus

CONCLUSION

The present study concludes that fecundity, fertilization and hatching rate can be substantially improved by captive breeding induced by hormone. The induced breeding experiment proves that combination of both ovatide and puitary extract inducement at a dose of 0.35ml/kg female is ideal to get better production than that can be obtained by natural breeding and ovatide. This investigation has standardized the ideal dose of ovatide hormone for induced breeding of C.auratus. The technology can boost production all year round without any crop gap, hence helpful for the farmers in better maintenance and in getting higher yields with the least input co

ABSTRACT

Pharmacognostic profile investigation of the of *Plumeria rubra* and *Plumeria alba* commonly known as Temple tree belongs to the family Apocynaceae. The investigations included the Total Alkanoid Content (TPC), Total Flavonoid Content (TFC), Total Phenolic Content (TPC). The sample were collected as leaf, bark and flower in regular month interval. Preliminary phytochemical analysis showed the presence flavonoids, alkaloids and phenolic contents. This work can be a valuable source of information of phytochemicals and can provide standards for identification of this plant material in future investigations and applications for researchers or scientists.The phytochemical content knowledge can help in field of herbal medicines in many developed and developing countries.

Keywords: *Plumeria alba, Plumeria rubra,* Phytochemicals, Plant material

INTRODUCTION

Plumeria rubra and *Plumeria alba* belong to family Apocynaceae is a sacculant, 2-8 mtr evergreen shrub having narrow elongated leaves, large and strongly perfumed white and pink flowers. Essential oil of Plumeria has antifungal efficacy and have potential for antimicrobial agents and also have pharmaceutical, anti-inflammatory, diuretic, emmengogue, febrifuge, purgative apllications and used as a tonic and expectorant[1]. Methanolic sample extract showed antimicrobial activity against *Pseudomonas aeruginosa,Bacillus anthracis*,The plant is reported to contain mixture of amyrins, amyrinacetate, scopotetin, the iriddoidsisoplumericin, plumierid ecoumerate, ß sitosterol, plumieride, and plumierid ecoumerate glucoside [2].

Nearly 80 % of the population of many developing countries are not capable to afford effective pharmaceutical drugs which based on plant, to sustain their basic health care needs which is a primary requirement [1]. In till date

medicines with herbal origin are in demand in the countries like both developed anddeveloping countries to meet basic healthcare need of people because of their vast medicinal and biological effectiveness, and also it has high safety margins than other genereic drugs and low in costs. Ayurvedic history of India has of greatknowledge on this herbal medicines which followed by tradition. The basic scientific knowledge on these traditional plants derivatives could be result clinically important. The major importance of herbal medicines seem to be their efficacy, low chances of side effects and low cost [3]. Various species of Plumeria contains different phyoconstituents. From P.acuminate leaves many phytochemicals can be isolated likelupeol acetate, lupeol carboxylic acid, stigmast-7-enol, and ursolic acid. P. rubra containing β-sitosterol-β-Dglucoside, lupeolnanoate, irroides viz. fulvoplumierin, allamcin and allamandin, as well as 2,5-dimethoxy-pbenzoquinone, (2R,3s)-3,4'dihdroxy-7,3',5'- trimethoxyflavan-5-O-β-D-glucopyranoside as Flavan3-ol Glycoside. Rubrinol; an antibacterial tritripenoid. together with teraxasteryl acetate, lupeol, stigmasterol, oleanolic acid had isolated from Bark[4].

The flower of P.rubra contains methylbenzoate, nerolidols, banzylbenzoate and methyl salicylate. The bark of P.alba containing alkaloids, flavonoids, phenolic compounds and tannins. The medicinal plant is reported to be essential by containing the iriddoidsisoplumericin, plumieride, plumieride, coumerate and plumieridecoumerate glucoside. In manystudy the antioxidant activity of methanolic extract of P. acuminate was evaluated[5].

MATERIALS AND METHODS

Collection and extraction

Leaves of *Plumeria rubra* and *Plumeria alba* were collected from GIET Campus,Gunupurand authenticated by a botanist at the Plant Anatomy Research Centre (PARC), Chennai, Tamil Nadu, India. Leaf, Bark, Flower of Plumeria of different species of different month were collected. The collection were dried in shade for 15 days and then grinded to form powder.

Phytochemicals determinationof the extract

The powder was quantitatively assessed for alkaloids, flavonoids and phenols using standard procedures as reported by Adedeji et al. (2013)[6].

Procedures

Methanol extract from the sample was prepared using Chan et al. (2006)[2] method by adding 12.5ml of methanol to 0.25gm of sample contained in a 15ml centrifuge tube and shaking, continuously at room temperature for 1 hour and 30 minutes. Methanolic extract of the sample was prepared by following the method of Chan et al. (2006) [2], by adding 12.5ml of methanol to 0.25gm of sample contained in a covered 15ml centrifuge tube and shaking , continuously for 1 hr 30 minutes at room temperature. The mixture was centrifuged at 3000-4000 rpm for 10 mins and then the supernat was collected and stored at -200c until analyse was done.

Quantification of Total Phenolic Content (TPC)

The total phenolic content was analysed by using folin-ciocalteu method [2]. 400µl of sample extract was added into the test tubes with 1.7ml of folin-ciocalteu reagent which was diluted 10times with double distilled water, and 1.4ml of Na_2Co_2 solution (7.5 w/v).The reaction was placed for 30mins at room temperature after which the absorbance was measured at 765nm against a blank prepared by distilled water. Total phenolic content was expressed as gallic acid equivalent in Mg/gm.

Quantification of total alkaloid content(TAC)

The total alkaloid contents of samples were investigated by 1, 10- phenanthroline method [7]. Sample powder (100gm) was extracted in 10 ml 80% ethanol. This was centrifuged at 5000 rpm (10 min). Supernatant were collected

to analyse the total alkaloids. The reaction mixture contained 1 mL plant extract, 1 mL of 0.025 M FeCl3 in 0.5 M HCl and 1 mL of 0.05 M of 1, 10-phenanthroline in ethanol. The blend was incubated in hot water bath (70±2 C) for 30 minutes. The absorbance of red coloured complex was measured at 510 nm. Alkaloid contents were analysed and it was calculated against standard curve of qui- nine (0.1 mg/mL, 10 mg dissolved in 10 mL ethanol and diluted to 100 mL with distilled water).

Quantification of total flavonoids content (TFC)

Aluminum chloride method [8] has been used for determining TFC. Sample (0.5 mL) of extract was dispensed into test tube, followed by 1.5 mL of methanol, 0.1 mL of aluminium chloride (10%), 0.1 mL of 1 M potassium acetate and 2.8 mL of distilled water. The reaction mixture was mixed, allowed to stand at room temperature for 30 min, before absorbance was read at 514 nm. TFC was expressed as quercetin equivalent (QE) in mg/g material.

RESULT AND DISCUSSION

Percentage extract yield

Plant tissue extraction procedures typically employ chemical ,mechanical,and/or enzymatic processes.. In this study, mechanical and chemical procedures were used sequentially with the aim of maximizing the efficiency of the extraction process. Ethanol was chosen because it has been widely recognised as suitable solvent for profiling plant tissues extracts in terms of quantity and quality.

Organoleptic characteristics of the extract

Leaves, Barks, Flowers of *Plumeria rubra* and *Plumeria alba* species produced a rough hand feel and greenish to brownish black paste with a strong alcohol smell under damp conditions while it produced a very fine elastic blackish paste with aromatic smell under dry conditions.

Phytochemicals' constituents of the extracts

In this study it was revealed that bark and flower of *Plumeria alba* contained appreciable higher phytochemicals than the *Plumeria rubra* while the leaf of *Plumeria rubra* contained higher phytochemicals than *Plumeria alba*.

Phenolic Contents

In this study it was revealed that bark and flower of *Plumeria alba* contained comparatively higher Total Phenolic content(TPC) than the *Plumeria rubra* while the leaf of *Plumeria rubra* contained less Total Phenolic content(TPC) than *Plumeria alba*. In *Plumeria rubra* the total phenolic content is higher in month of June while the content is less in month of May due to the effect of Temprature, Humidity etc.

Alkaloid Contents

In this study it was revealed that the bark and flower of *Plumeria rubra* contained comparatively higher alakaloid content Total Alkaloid Content(TAC) than *Plumeria alba* while the leaf of *Plumeria rubra* contain less Total Alkaloid Content(TAC) than *Plumeria alba*. In leaf of *Plumeria rubra* the Total Alkaloid Content(TAC) is higher in month October while the content is less in month of March due to the effect of Temprature,Humidity,Rain fall etc.

Flavonoid Contents

In this study it was revealed that the bark and leaf of *Plumeria alba* contained comparatively higher Flavonoid content Total Flavonoid Content (TFC) than *Plumeria rubra* while the leaf of *Plumeria alba* contain less Total Flavonoid Content(TFC) than *Plumeria rubra*. In leaf of *Plumeria rubra* the Total Flavonoid Content (TFC) is higher in month July while the content is less in month of March due to the effect of Temprature,Humidity, Rain fall etc.

CONCLUSION

In this study, regular harvesting of Plumeria extract was readily obtained on a monthly basis as it stooled and pollarded mother plants.. Stooling and pollarding ensured fresh and sufficient quantity that can be explored for commercial use as Plumeria protectant. The air-dried extract subjected to mechanical and chemical extraction processes sequentially yielded appreciable quantity of 5.67% ± 0.04 (n ¼ 4) ± S.D.The result (yield obtained) indicated ethanolic extraction of the Plumeria extract was able to produce enough extract for the purpose of sample treatment. Organoleptic assessment produced important characteristics such as desirable colour, odour and texture including miscibility which are of useful preservative characters.

Remarkable variations were observed between the colour, odour, and texture of the extract under the damp and dry conditions. The brownish black colour obtained suggested that Plumeria extract biomasspredominantly contained brown and black colouring pigments. The extract was found to produce burning smell under damp condition and strong burning smell (odour) under dry condition. Texture of the extract exhibited fine hand slippery feel under damp condition and formed very fine thick elastic paste under dry condition. The result suggested that the Plumeria extract contained copious amount of organic soluble oils. Chemical composition showed greater bioactive compounds in the leaf and flower compared to bark indicating the physiological defense role of stem that could have probably had greater protective impact on sample if harnessed in sufficient quantity. None readily bio-obtainability of the leaf and bark limited its use for wood treatment and antidegradation tests. Leaf extract contained 3.694 ± 0.32 mg/g total alkaloids as highest,2.61 ± 1.15 total phenol, and 0.096 ± 0.02 total flavonoids. The differences in amount of chemical compounds could be due to both intrinsic and extrinsic factors such as age, nutritional status, place of nativeness, environmental conditions, storage period etc. As expected, test block wood samples both of which are white wood contained very small or little amount of chemical compounds confirming them non-durable and suitable as reference test wood species.

ACKNOWLEDGEMENTS

The authors gracefully acknowledge for providing necessary help and support provided by Centurion University of Technology and Management. The authors wish to thank Dr.Gyana Ranjan Mahalik for providing necessary facility to conduct the work.

Conflict of interest

We declare that we have no conflict of interest.

ABSTRACT

India has the biggest devolution of innate populace on the planet. The innate are the offspring of nature and their way of life is melded by the eco-framework. India because of its various biological systems has a wide assortment of ancestral populace. The inborn painstaking work are particular aptitudes which are given starting with one age then onto the next and these crafted works are methods for money of the craftsman. Be that as it may, without any sorted out action in this part and the items not being enough gainful, there is a potential pay of the craftsman taking up interchange economy choices (which may include movement also). In such a case this well established movement will kick the bucket its own demise. At this stage it is basic to comprehend the issues looked by this division and propose the systems for advancement of ancestral craftsmanship dependent on which certain approach level intercessions should be taken by the administration to support the conventional inborn handiworks. This undertaking discovers various issues related with Mahali experts occupied with delivering bamboo painstaking work in the towns of Jharkhand. The principle goal of the examination is to survey the bamboo make as economy alternatives for the Mahali innate network of towns, Angara, Jharkhand. Mahali has a recognized specialty legacy. Their uncommon imaginative aptitude has been smoothed out in the production of perfect family unit pieces. Not with standing, the craftsman network faces various issues and need intercession to improve their personal satisfaction. The examination features that the network

of the contemplated town experiences the gracefully of crude materials, gainful showcasing opportunity, appropriate abilities and mindfulness identified with item improvement. This venture, through essential research likewise discovers other auxiliary and utilitarian issues related with the network and recommends arrangements which can be extrapolated for various craftsman network.

Keywords: biological, network, craftsman, economy

INTRODUCTION

The craftsmen are a significant segment of our general public. By giving us perfectly made items, they upgrade our stylish life. Other than they are huge supporter of our national economy. Our handiworks have cut out a unique specialty in both created and creating nations. The term 'craftsman' is utilized to allude to those individuals who work with conventional or straightforward apparatuses to make things of fundamental need. They for the most part utilize the locally accessible assets and make important items without the guide of machine. Craftsmen generally work in conventional and disorderly area in which they are powerless against misuse and low wages. (Ansari, 2014). In India make isn't just an industry however the produce is seen as a creation representing the inward want and satisfaction of the network. Specialty Council brings up that no Indian art is ever absolutely brightening. While painstaking work, be it metal product, ceramics, mats, wood-work or weaving, satisfy a constructive need in the day by day life of individuals (Sood, 1999). High quality exercises have been remembered for family unit enterprises and labourers occupied with a portion of the administration exercises of craftsman bunch have been treated as different specialists. The fundamental measures of family unit ventures are the investment of at least one individual from family unit. This division may cover financial exercises, for example, creation, preparing, overhauling or fixing of articles or merchandise, for example, handloom, weaving, colouring, carpentry, bidi, moving earthenware producing, bike fixing, blacksmithing, fitting and so forth relying on the spot of their works the whole craftsmans works might be gathered under family and non-family sector. (Bhakare, 2016). Bamboo craftsmanship area is dominating in the Indian painstaking work and there are a huge number of individuals who rely upon bamboo for part or the entirety of their pay. The craftsman was a significant factor in the condition of Indian culture and culture. The Village people group of skilled worker have consistently been the focal point of the customary artworks of India. The station framework forced by the code of Manu protected the antiquated conventions and forestalled, or if nothing else held within proper limits, the debasing impact of outside idea. For the improvement of a less evolved state like Jharkhand, it is important to teach individuals and to prepare them in different ability and art so as to improve their everyday environments.

METHODOLOGY

The study has been carried out in the framework of villages of Angara Block, Ranchi District under Jharkhand. The Preliminary information about the block has been gathered from the Block office and secondary sources. The data for this study has been collected from Bisa, Jonha, Lupung, Gitalsud and Maheshpur villages of Angara block under Ranchi district of Jharkhand. The village was selected purposively. The independent variables which were taken for measuring the findings of the research were age, family size, family education index, family occupation & individual income.

A. Socio-economic status of the Mahali tribes

This table shows the analysis of the total population of Mohali families. In villages, 56% male and 44% female, they were depended only on Bamboo craft for their livelihood.

Age-wise analysis reveals that almost majority of the artisans in the block comes under the age group of 31-40 years (38.75%). As a matter of fact, more than half of the artisans engaged in making decorative art from bamboo were aged people in the age group of 41-60 or above i.e. 57.50%. The young age group also engaged in handicraft activities on good number i.e. 25% and 27.5%. Most of the artisans involved in bamboo handicraft activities belong to the economically weaker sections of the society. In villages, most of the bamboo handicraft artisans (100%) reported to belong to below poverty line status of the economy. The analysis of educational status of the handicraft artisans presented a very interesting picture. Most of the bamboo handicraft artisans in the village are illiterate (50%). 20% handicraft artisans reported to have received education from class 1-5, 22.5% handicraft artisans reported to have received education from class 6-8 and 7.5% handicraft artisans reported to have received education from class 9 and above.

As indicated in the table alongside, in most of the handicraft artisan households (90%) handicraft activity was reported as the main occupation. In some households, however, handicraft activity has been taken up as alternative livelihood activities to augment family income. 10% handicraft artisans reported that handicraft activity was taken up as secondary occupation for them. In some households, handicraft activity was not reported as main occupation even if the contribution of handicrafts to the annual family income was reported as higher than from other sources. This was attributed to the time the family spent on agriculture and other allied activities in the whole rather than on handicraft activities. In case of women and especially in the case of embroidery, knitting and stitching it was reported that the time left after completing household chores was used for making handicraft items as it contributed to the family income. In bamboo handicraft activity like sup, dowra, Kachi and tokari all the hanidcraft artisans reported that handicraft activities were the main occupation for them. In case of other handicraft activities most of the handicraft artisans said that handicraft activities were their main occupation.

As indicated in the table alongside, in most of the 60% handicraft artisan households were land less, 27.5% handicraft artisan households were marginal land, 8.75% handicraft artisan households were small land and 3.75% handicraft artisan households were large land. The handicraft artisans were mainly practice to agriculture cropping pattern for only house consumption purpose. In the villages of Angara block there was much difference between males and females as far as contribution to handicraft activities is concerned. There was a significant difference in contribution to handicraft activities between males and females. In villages males contribute 81.25% to all the handicraft activities whereas females contribute 18.75% to the handicraft sector. In other activities like household work, labour work, women contribute equal or more than equal to men whereas in handicraft activities like tokari, sup, and dawara making and painting, women were found to be less involved.

B. Economics of bamboo handicraft products

The table highlights the distribution of respondents on the basis of monthly income (No=80). It was observed from this table that majority of the artisans i.e. 81.25% were having average monthly income of Rs- 2000 – 4500 followed by 4600 – 7000 and 7100 - 10000 per month (15 % and 2.50%), only 1.25 percent of the artisans were having more than 10000 rupees income per month. The main reason behind it was lack of marketing opportunities. This table also shows that the standard of leaving is so poor due to low economic status of the household. This art is still continuing despite all odds faced by these tribal households. This section mainly brings out with various types of handicrafts made by these tribals and problems faced by these households. The raw materials for handicraft articles were collected from Bisa (Beti), Jonha, Lupung, Gitalsud and Maheshpur villages. The local bamboo procured from mainly four village forested areas viz. Bisa, Lupung, Gitalsud and Maheshpur but the *barlanga* bamboo could only be obtained from Jonha forest. The costs of local or *dehati* bamboos were Rs.30 per piece whereas *barlanga*/Pahari bamboo was procured from dense forest. These table reflects the marketable price or sale price of the products such as sup was Rs.40-80 per piece, Small *Khacha* was Rs.200-300 per piece, Big *Khacha* was Rs.300-500 per piece *Dowara* was Rs.200-300 per piece, *Panka* was Rs.15-20 per piece and Small *Tokri* Rs.50 per piece, Big *Tokri*was Rs.100 per piece, *Japa*was Rs.100 per piece, *Toki* was Rs.30-40 per piece, *Chala* was Rs.100 per piece, *Dela* was Rs.50-60 per piece,

*Jaru*was Rs.30 per piece, *Bawni*was Rs.20-30 per piece, *Chata* was Rs.200 per piece, *Tupa* was Rs.25 per piece and *Harka* was Rs.60-80 per piece.

The above table display the month wise production of bamboo crafts. In peak months of *Paus* to *Chaitra* (January - April) basketry products are more primed and during this period they earn the most from the basketry products but cost is not identical throughout the year, it falls down in the month of *Baisak* (May) and reaches the minimum in the months of *Ashar* (June-Jully) and *Sravana* (Jully-August) and again increase during *Kartick* (October-November) to Paus (December-January). During the month of *Ashar* (June-Jully) and *Sravana* (Jully-August) they partially remain engaged in agricultural activities, as a result of which, their productions of bamboo-work dwindle very much. During the non-agricultural season, they fully exist on basketry products as well as occasional participation in other supplementary occupation like, hunting, fishing and procurement of wild products and rarely as wage earners. *Dowara* and *Harka*was mainly used in marriage occasion and Small *Khacha*, Big *Khacha* was used for seeds storage.

CONCLUSION

Troubles in creating bamboo crafted works in the eastern territories like Jharkhand have created numerous fruitful techniques in creating and improving their bamboo painstaking work. The artworks are quality items made locally by utilizing common materials, took into account the network's needs and are progressively tough and sturdy by actualizing regular materials and propelled information on new safe materials and strong by executing normal materials and propelled information on new safe materials and strategies that will help spare the earth and help the skilled worker and network accomplish maintainable monetary turn of events. Inventive thoughts were likewise used to make new items by receiving and changing conventional kinds of artworks and transforming them into valuable family things, blessings, trinkets and toys. These new items despite everything save conventional examples, styles yet have been esteem included by finding another utilization and market for nearby social fortunes. The vast majority of the craftsmans having a place with poor foundation need back up their monetary status through giving them current method since they face the troubles in expanding the item amount in the market. The interest situated preparing would give more pay to the families. Hence there need a solid support with the state government to actualize the program for craftsman at the grassroots level and their financial status increments in the general public.

ABSTRACT

The study is based on the data collected from randomly selected 100 households (trained and untrained) through well-structured questionnaire and personal interview method.The study revealed that there was positive impact of training on lac growing households in terms of host utilization, livelihood conditions, and income and employment generation. The host utilization has been found to increase significantly after training of households in comparison to untrained households. A significant shift from lower production group to higher production group has been observed by trained households. Higher level of broodlac production was resulted in self-sufficiency in broodlac and more utilization of host trees for lac cultivation. The disposal pattern of crop outputs was found the same because due to lack of organized market, both the trained and untrained households sell their product in the local market. Households utilized the technologies in lac cultivation such as phunki lac removal was adopted by 100% households.Thus, the dissemination of lac cultivation technologies and strengthening of value chain and farmers' industry linkages may play a key role to harness the opportunities available for the forest and sub-forest dwellers, lac processors, manufactures, exporters and other stakeholders. Gainful

employment can be generated for migrating youths while also providing quality output to the hands of the consumer.

Keywords: Lac, Cost, Returns, Trained, Untrained, Household, Income, Employment,

INTRODUCTION

Lac is a resinous encrustation. It is produced by *phytophagous* scale insect *Kerrialacca Kerr* belongs to the family *Tachardiidae* (*Kerriidae*), superfamily *Coccoidea* of the order *Homoptera* which grow up on three commercial hosts, namely *kusum* (*Schleicheraoliosa), ber* (*Ziziphusmauritiana*) and *palas* (*Betuamonosperma*) (Govind Pal,2009; Ahmad *et al*., 2012). It is the only resinous compound of animal origin which has high economic importance due to safety for human use, it is renewable and ecosystem friendly (Ranjan *etal*., 2011). Lac is a natural resinous substance which has high economic importance in India. It is the only resin from animal origin which has diverse use. India is the country, which produce the lac more than 50% of the world's total production. Now a day an average of almost 20-22 thousand tons raw lac produced in our country. Maximum lac produced in India is from forests. (Chattopadhyay, 2011)In India, there are many lac insect species and among them *Kerrialacca (Kerr)* is used for cultivation. Two strains are, *Rangeeni* and *Kusmi* contribute 90% of the country's total lac production (Ramani, 2005). The Indian lac insect *Kerrialacca (kerr)* has two strains of lac insects are *rangeeni* and *kusmi* which have different host preference. Two crops are produced from these two strains per year. The two lac crops of "*rangeeni"* insects are *kaka* (rainy season) and *baisakhi* (summer season). *Rangeeni* strain can grow well mainly on *palas* host and some other trees also except kusum host, but *Kusmi* insects can grow well on *kusum* host and some other trees also except *palas* (Kapur, 1962; Ramani, 2005). Lac insects yields different important products like resin, wax and dye, with wide range of applications in food, adhesives, cosmetics, jewellery, paints, pharmaceuticals, perfumes, polishes varnishes and textile dyes etc. The resinous secretion (stick lac) contains about 4-5% of wax and 1% of water-soluble colouring material (lac-dye) (Dave, 1950; Sarkar, 2002; Ramani*et al*., 2007).

Lac cultivation in India

Almost 70% of the Worlds production from India and occupy the highest position in the production and export of raw lac products at the world market followed by Thailand with about 35% of the World market (Ramani *etal*, 2007).
Lac cultivation is a crucial supply of financial gain for living of the forest and sub-forest dwellers in numerous states. Besides, it's high potential for generating employment for each men and ladies in forest and sub-forest areas. In India, lac cultivation is done by village and social groups and highly practiced in the states like Jharkhand, Chhattisgarh, Orissa, West Bengal, Madhya Pradesh, Maharashtra and parts of Uttar Pradesh, Andhra Pradesh, Gujarat, and North Eastern Hill (NEH) regions (Pal, 2009). Jharkhand produce the highest lac in the country. Jharkhand contributes 58% in national lac production followed by Chhattisgarh (16.1 %), Madhya Pradesh (11.9 %), Maharashtra (5.6 %) and Odisha (3.2 %). 29% of forest area covered by the Jharkhand state (Yogi *etal*, 2014).
Ranchi, Khunti, Latehar, Lohardaga, Saraikela, Garwah West and East Singhbhum, Gumla, Simdega, Palamau, and Hazaribaghdistricts are some major lac growing districts of Jharkhand state (Chattopadhyay, 2011). In this area, the *palas*, *ber* and *kusum* are the main host plant for lac cultivation which is available. Lac production is generally found in forest and sub forest areas but now it is spreading to agriculture and waste land near the forest. Cultivation in *Semialta* has also spread quickly through seed and it has an important advantage that is its short gestation period. On an average, 39% of national lac production is contributed by this state. Ranchi is producing the highest amout (Partha and Prabhat, 2014).

Scope for the forest dwellers

Lac cultivation does not require high technology and high investment. Only part time labour is required for cultivating lac which is highly suitable for tribal people because some time they are engaged in agriculture, sometime in labour work etc. More attention by the people can lead to higher production by adopting scientific technology for cultivating lac. Lac insects are cultured on such host trees which are capable of growing in wastelands (Chattopadhyay, 2011).

Socio-economic upliftment and Employment generation through lac cultivation:

Lac cultivation is one of the most important sources of supplementary income for those who are living in forest or near the forest because the agriculture depends on rainy season only. Lac cultivation requires low investment and high profit can be achieved that is why lac cultivation is highly favourable for the tribal people. Ranchi is one of the most important lac producers in the state. Most of the STs/SCs and other economically backward communities of the district are engaged in lac cultivation.

The lac cultivation activity has high potential for generating employment for both men and women during the slack season of agriculture. Employment is generated in three stages: a) Cultivation of Lac; b) processing of Lac; and c) Trading of Lac.

Lac cultivation is done by all type of farmers i.e. marginal, small, and big also who have lac host trees *i.e..palas*, *ber* and *kusum* trees which are available in degraded land forest land, embankments unused land and plenty in the agriculture field.

OBJECTIVES OF THE STUDY

1. To study the socio economic profile of the lac growers.
2. To estimate the cost-yield analysis of lac growers.
3. To patronize and identify the constraints the problems of lac growers.

METHODOLOGY

The present study is based on the primary data collection from tribal area of Ranchi district of Jharkhand, conducted in purposively selected villages Tirlakocha, Burhakocha, Puradag, Sursu and Kuturlowa comes under Angara block of Ranchi district. It is a hilly, forested track with limited agriculture mostly paddy. Based on the information, a survey has been conducted in five villages. Finally, a total of 100 lac growers are selected and surveyed. Out of 100 lac grower, 70 trained lac growers are selected based on training exposure. For a comparative analysis of traditional and modern method of lac cultivation, 30 lac growers were selected who had not received training.

RESULT AND DISCUSSION

Socio-economic profile of the lac growers

Table 1 depicts the distribution of sampled households (trained and untrained households) across four different categories. Based on the availability of lac host tress, households were categorized in small (2-10 trees), medium (11-20 trees), large (21-100 trees) and very large (above 100 trees). It has been found that out of 100 identified households 70% household were trained and 30% were untrained. It was found that maximum household falls under medium and large category in case of both trained and untrained i.e. 36% and 35 % of the total respondent followed by 24% small and 5% very large category.

The above table shows that most of the respondents belongs to the age group of 19 to 40 years i.e. 46% of the total population followed by 41 to 60 years of age group i.e. 43 %. 9 % of the total population belongs to above 60 or aged age group. Only 2 % of the population having the age group of below 18 years.This table depicts the educational status of the respondents. Most of the respondents from both the trained (26%) and untrained (13%) categories were found illiterate i.e. 39 % of the total population followed by 26 % have received education up to class 5. 13 % of the population got their education up to class 6 -9 and 14 % have educational status up to class 9-10. Only 6 % respondent continued their education up to higher secondary level. A very interesting picture has been found from this table i.e. only 2 % of the total respondent have the education up to graduation or above and they were comes under the trained category.

Average family size of small, medium, large and very large category of both trained and untrained households is depicted in this table. In case of trained households, average family size of small category is 5.38 persons per family, followed by 5.68 persons in the medium category, 5.33 persons in the large category. Compare to the other categories, very large category have high average family size that is 6.66 persons per family.In case of untrained households, they also have high average family size that is 7 persons per family. In case of small medium and large categories they have almost same family size that are 5.83, 5.09, 5.63 persons per family.It was observed that small and medium categories have the same average family size that are 5.5 persons per family, followed by 5.42 persons in large category and 6.8 persons in the very large category. Overall average family size was found 5.54 persons per family.

Table 5 depicts the population and sex ratio of trained, untrained and pooled households. In case of trained households there are 191 males and 196 females, so the sex ratio is 97.4. In case of untrained households there are 81 males and 86 females. So the sex ratio is 94.1. Total num*ber* of male population in case of trained households is 268 and female population is 286. So the sex ratio is 93.7.The table 6 shows the experience of sampled households in lac cultivation. Overall sampled households having average experience of 9.96 years. Very large category of trained households and large category of untrained households were observed highly experienced i.e. 12.33 years and 11.02 years. Average experience of trained and untrained households was found 9.41 years and 11.23 years. In case of pooled households, it was found that the large category is highly experienced.

The above table shows average annual income of the respondents. It was witnessed from this table that majority of the farmers from Trained category i.e. 28% have the income of rupees >2 lakhs to 3.5 lakhs per annum followed by 24 % of the total respondent have the income range of rupees > 3.5 lakhs to 5 lakhs per annum. In case of untrained category 13 % of the total respondents have annual income of rupees > 3.5 lakhs to 5lakhs followed by >2 lakhs to 3.5 lakhs income range i.e. 12%. 20% of the total respondents earn up to 2 lakhs per annum from lac. Only 3% of the total population earn more than 5 lakhs per annum but they were comes under trained category witch reflects that the trained farmers were more skilled and expert of lac production and processing as compared to untrained farmers.

Proportion of available and inoculated *ber* host trees by trained households were presented in Table 8. It was evident from the table that in case of trained households, the utilization of *ber* host trees decreased in 2018-19 i.e. 36.2% in comparison to 36.5% in 2017-18. An increase was found in case of very large category of trained households from 8.8% to 9.4%. inoculation of host trees were found maximum in case of small category i.e. 91.3% in 2017-18 and 93.5 in 2018-19, followed by medium 63.1% in 2017-18 and 58.01% in 2018-19, large 33.2% in 2017-18 and 30.8% in 2018-19, very large 21.3% in 2017-18 and 23.3% in 2018-19. Table 9 depicts the available and inoculated *ber* host trees by untrained households. It was found that the utilization of *ber* host trees remains same in both the year 2017-18 and 2018-19 i.e. 92.3%. Availability of *ber* host trees found highest in case of large category but utilization was second last. It has been found that the availability of *ber* host trees in case of untrained households found very less in case of small category but the utilization of *ber* host trees was maximum that was near 90% both the year. Very less utilization of *ber* host trees were found in case of very large category that was near 21.3% in 2017-18 and 23.3% in 2018-19.

Proportion of available and inoculated *ber* host trees by pooled households were presented in **Table 10.** It was evident from the table that the utilization of *ber* host trees decreased in 2018-19 i.e. 41.4% in comparison to 43.7% in 2017-18. An increase was found in case of very large category from 21.3% to 23.3%. In case of pooled households the availability of *ber* host trees was less in case of small category but utilization was high that was 93.2% in 2017-18 and 91.3% in 2018-19.Proportion of available and inoculated *kusum* host trees by trained households were depicted in Table 11. It was evident that utilization of *kusum* host trees increased in 2018-19 (63.8%) in comparison to 2017-18 (59.0). A decrease was also found in case of large category that was from 61.8% to 57.7%. The highest increase was found in case of medium category from 49.4% to 63.5%. In both the years 2017-18 and 2018-19, maximum num*ber* of *kusum* trees was inoculated by the large category that was 60 trees in 2017-18 and 56 trees in 2018-19.

It was observed from table 12 that inoculated *kusum* lac host trees by untrained households were almost same in both the years 2017-18 and 2018-19. Small category increased the utilization of *kusum* host trees in 2018-19 (72.2%) in comparison to 2017-18. In case of medium category there was slight increase in 2018-19. Highest increase was found in case of large category from 37.5% in 2017-18 to 45% in 2018-19. But there was highest decrease in case of very large category. Table 13 depicts the *kusum* host utilization of pooled households; it was marked from the table that households increased 3.4% in 2018-19. Highest increased was found in case of medium category but they utilized only 36.0% of total lac host trees in 2017-18 and 46.6% in 2018-19. Maximum utilization of *kusum* host trees was found in case of small category. Small category utilized 69.1% in 2017-18 and 73.5% in 2018-19. Decrease in utilization of host trees was also found in case of large and very large category.

The above table shows that total inoculated brood lac by trained were decreased in 2018-19 (2557 kg) in comparison to 2017-18 (2611 kg). In case of *ber*, total inoculation was 1441 kg in 207-18 and 1392 kg in 2018-19 by all categories of households. Decrease was observed in 2018-19 in comparison to 2017-18. In case of *kusum*, total inoculation was 1170 kg in 2017-18 and 1165 kg in 2018-19 by all categories of households. Very little decrease was observed in *kusum*. In case of total (*ber+kusum*) inoculation, it was observed that small category has decreased brood lac inoculation in 2018-19 (545 kg) in comparison to 2017-18 (595 kg), followed by medium category 788 kg in 2017-18 but 787 kg in 2018-19, large category 1082 kg in 2017-18 but 1081 kg in 2018-19, very large category 146 kg in 2017-18 but 144 kg in 2018-19.
It can be noted down from the table 15 that the quantity of brood lac inoculated on *ber* trees by trained households was decreased from 17.11 kg per household to 16.05 kg per household in case of small category of households, followed by medium from 19.44 kg per households to 19.96 kg per households, large from 23.95 kg per households to 22.75 kg per households and very large from 24 kg per households to 19.33 kg per households. So only medium category has increased their brood lac inoculation of *ber* and rest categories have decreased.

Quantity of brood lac inoculated on *kusum* trees by trained households was decreased from 15.94 kg per household to 14.22 kg per household in small category of household, followed by medium from 12.2 kg per household in 2017-18 to 11.52 kg per households in 2018-19, large from 21.12 kg per households to 22.29 kg per households and very large category from 24.66 kg per households to 28.66 kg per households. Overall inoculation of brood lac in *ber* trees of all categories was 21.12 kg and 19.52 kg per household in 2017-18 2018-19. Overall inoculation of brood lac in *kusum* trees was 18.48 kg and 19.17 kg per household in 2017-18 and 2018-19. Average inoculation by trained households in 2017-18 was 39.60 kg per household in *ber* and *kusum* trees. Average inoculation by trained households in 2018-19 was 38.54 kg per households in *ber* and *kusum*. So we can conclude that trained household has decreased their brood lac inoculation.Table 16 display that total inoculated brood lac by untrained households were increased in 2018-19 (287 kg) in comparison to 2017-18 (280 kg). In case of *ber*, total inoculation was 199 kg in 207-18 and 192 kg in 2018-19 by all categories of households. In case of *kusum*, total inoculation was 81 kg in 2017-18 and 95 kg in 2018-19 by all categories of households. Very little increase was observed in *kusum*. In case of total (*ber+kusum*) inoculation, it was observed that small category has the same amount of brood lac inoculation in 2018-19 and 2017-18 that was 188 kg, followed by medium category 373 kg in 2017-18 but 354 kg in 2018-19, large category 353 kg in 2017-18 but 410 kg in 2018-19, very large category 205 kg in 2017-18 but 287 kg in 2018-19.

It can be noted down from the table 17 that the quantity of brood lac inoculated on *ber* trees by untrained households was decreased from 17.6 kg/ household to 17 kg/household in case of small category of households, followed by medium from 29.5 kg/household to 27 kg p/household, large from 22.2 kg/household to 22.7 kg/household and there was no change in case of very large category. Only large category has increased their brood lac inoculation on *ber*.Quantity of brood lac inoculated on *kusum* trees by untrained households was increased from 13.6 kg/household to 14.3 kg/household in small category of household, followed by medium from 4.3 kg/household in 2017-18 to 5 kg/household in 2018-19, large from 9.8 kg/households to 14.5 kg/household and very large category from 42.5 kg/households to 38 kg/households. Overall inoculation of brood lac in *ber* trees of all categories 32.3 kg/household and 31.6 kg/household in 2017-18 and 2018-19. Overall inoculation of brood lac in *kusum* trees was 17.5 kg/household and 17.9 kg/household in 2017-18 and 2018-19. Average inoculation by untrained household in 2017-18 was 49.8 kg/household in *ber* and *kusum* trees. Average inoculation by trained households in 2018-19 was 49.5 kg per households in *ber* and *kusum*. So we can conclude that untrained household has decreased their brood lac inoculation in 2018-19.

It was evident from the table 18 that total quantity of *phumki* lac received by trained households was increased in 2018-19 (947 kg) in comparison to 2017-18 (876 kg). The increase of phunki removal was observed in *ber* host trees that was 16.6% but there was no change in case of *kusum*. In case of small category of households there was an increase in *ber* tree (57.1%) and decrease in *kusum* (-17.3%). In medium category of households, phunki removal was found increased in case of *kusum* (8.9%) but decreased in case of *ber* (-9.0%). In case of large category of households, there was an increase in *ber* and *kusum* trees (26.4%) and (5.4%). In case of very large category of households there was no change in *ber* and a decrease was found in *kusum* (-10%). Highest increase was observed in large category of households (26.4% for *ber* and 5.4% for *kusum*). Whereas in table 19 it was perceived that total quantity of phumki lac received by untrained households was increased in 2018-19 (454 kg) in comparison to 2017-18 (441 kg). The increase of phunki removal was observed in *ber* and kussum host trees that were 1.6% and 6.1%. In case of small category of households there was an increase in *kusum* tree (63.6%) and decrease in *ber* (-36.3%). In medium category of households, phunki removal was found decreased in *ber* and *kusum* both host trees that were -7.6% and -10%. In case of large category of households, there was an increase in *ber* tree (28.2%) but there was decrease in *kusum* tree (-1.8%). In case of very large category of households, there was an increase in *ber* (27.6%) and a decrease was found in *kusum* (-8.8%). Highest increase was observed in large category of households.

It was evident from the table 20 that total produced scrapped lac by trained were increased in 2018-19 (4891 kg) in comparison to 2017-18 (4884 kg). In case of categorised groups of trained, the increase and decrease in the quantity of total produced scrapped lac was observed. Scrapped lac production on *ber* was observed decreased in all categories. In case of small and medium category, there was an increase in *kusum* tree that were 105.7% and 14.2%. In case of large and very large category, there was a decrease in *kusum* tree that were -11.9% and -6.6%. Overall it has been found that the scrapped lac production increased in 2018-19 that was 0.1%. Table 21 display that total produced scrapped lac by untrained were decreased in 2018-19 (1566 kg) in comparison to 2017-18 (1593 kg). In case of categorised groups of untrained, the increase and decrease in the total quantity of total produced scrapped lac was observed. In case of small category, there was an increase in scrapped lac production in *kusum* tree but a decrease was observed in *ber* tree. In case of medium category, there was a decrease in *kusum* tree but increase in *kusum* tree. In case of large category, there were increase and decrease in *ber* tree and *kusum* tree that were 6.4% and -8.8%. In case of very large category, there were a decrease in both *ber* and *kusum* tree that were -4.2% and -4.3%. Overall in *ber* and *kusum* there was an increase in case of large category that was 2.8%.

Quantity of produced brood lac by trained and untrained households were presented in Table 22 and 23. In case of trained farmers it was found that quantity of total produced brood lac was decreased in 2018-19 (1998 kg) in comparison to 2018-19 (2025 kg). The quantity of produced brood lac was decreased in case of small category, followed by medium and large category, it was found decreased that were -2.2% and -3.3%. In case of very large category, quantity of brood lac increased by 14.8%. Overall it was found decreased by -1.3%. Whereas in case of

untrained farmers it was observed that quantity of total produced brood lac was decreased in 2018-19 (357 kg) in comparison to 2018-19 (366 kg). Quantity of produced brood lac was decreased in case of small category by -9.6%, followed by medium, it was increased that was 10.4% and large category, it was found decreased that was -8.3%. In case of very large category, quantity of brood lac production increased by 11.5%. Overall it was found decreased by -2.4%. It was depicted in the table 24 that the total quantity of phunki lac production from *ber* trees was 498 kg by the trained households. Out of that small category produced 110 kg followed by medium category 150 kg, large category 220 kg and very large category produced only 18 kg of phunki lac. Total quantity of scrapped lac production by the trained household from *ber* trees was 3177 kg. Out of that small category produced 725 kg followed by medium category 980 kg, large category 1322 kg and very large category produced 150 kg. Total quantity of lac produced by the trained households was 3675 kg.

Total quantity of phunki lac produced from *kusum* tree by the trained household was 429 kg and total quantity of scrapped lac produced by the trained household from *kusum* trees was 1714 kg and the total amount was 1998 kg. Total quantity of brood lac production by the trained households from *ber* and *kusum* trees was 1998 kg, out of this small category produced 542 kg followed by medium 612 kg, large 720 kg and very large 124 kg only. So the total quantity of lac produced from *ber* and *kusum* by the trained households was 7816 kg and out of this small category produced 2173 kg followed by medium 2344 kg, large 2888 kg and very large category produced 411 kg. **Table 25** depicts the total quantity of lac production by trained households in kg/households. Overall phunki lac production by the trained household from *ber* trees was 7 kg/household. Scrapped lac production by the trained household from *ber* trees was 46 kg/ household and total lac production by the trained household from *ber* trees was 53 kg.

Overall phunki lac production by the trained household from *kusum* trees was 5 kg/household. Scrapped lac production by the trained household from *kusum* trees was 28 kg/household and average lac production from *kusum* was 33 kg/household by the trained household. Average brood lac production by the trained household from *ber* and *kusum* trees was 31 kg/household and total lac production by the trained households from *ber* and *kusum* including brood lac was 117 kg per household. Table 26 depicts the total quantity of lac production by untrained households. Total phunki lac production by the untrained households was 315 kg from *ber* trees followed by scrapped lac 1215 kg and the total lac production by the untrained households from *ber* trees was 1530 kg. Total quantity of phunki lac production by the untrained households from *kusum* trees was 139 kg followed by scrapped lac 351 kg and the total lac production from *kusum* trees was 490 kg. Total brood lac production by the untrained households from *ber* and *kusum* was 490 kg and grand total production by the untrained households from *ber*, *kusum* including brood lac was 2377 kg.

Table 27 depicts the total quantity of lac production by untrained households in kg/households. Average phunki lac production by the untrained household from *ber* trees was 14 kg/household. Scrapped lac production by the untrained household from *ber* trees was 49 kg/ household and average lac production by the untrained household from *ber* trees was 53 kg. Overall phunki lac production by the untrained household from *kusum* trees was 7 kg/household. Scrapped lac production by the untrained household from *kusum* trees was 19 kg/household and average lac production from *kusum* was 26 kg/household by the trained household. Average brood lac production by the untrained household from *ber* and *kusum* trees was 14 kg/household and total lac production by the untrained households from *ber* and *kusum* including brood lac was 103 kg per household.

Cost of cultivation: cost of inoculated brood lac paid by the trained households was presented in Table 28 it was revealed that total quantity of brood lac inoculated by the trained households in *ber* trees was 1186 kg and Rs.142320 paid by the trained households for 1186 kg brood lac. Highest amount paid by the large category that was Rs.61440 for *ber* trees. Total quantity of brood lac inoculated by the trained households for *kusum* trees was 878 and Rs. 105360 paid by the trained households for 878 kg of brood lac. Highest amount paid by the large category that was Rs.38400. Total quantity of brood lac inoculated by the trained households in *ber* and *kusum* trees was 2064 kg and Rs. 247680 paid by the trained category. Table 29revealed that total quantity of brood lac inoculated by the untrained

households in *ber* trees was 621 kg and Rs.74520 paid by the untrained households for 621 kg brood lac. Highest amount paid by the medium category that was Rs.29160 for *ber* trees. Total quantity of brood lac inoculated by the untrained households for *kusum* trees was 338 kg and Rs. 40560 paid by the untrained households for 338 kg of brood lac. Highest amount paid by the large category that was Rs.14400. Total quantity of brood lac inoculated by the untrained households in *ber* and *kusum* trees was 959 kg and Rs.115080 paid by the trained category. Highest amount paid by the large category for *ber* and *kusum* trees. A perusal of the Table 30 showed that highest inputs cost paid by trained households in lac cultivation activities was large (Rs. 8950) category of households followed by medium (Rs. 3005), small (Rs. 2800) and very large (Rs. 840) categories of households. Overall, it was found Rs. 15595 for the cost of other input. Apart from this, small, medium and very large categories of households were not using secateurs, nylon net and scraping knife. Table 31 showed that inputs cost paid by untrained households in lac cultivation activities was large (Rs. 660) category of households followed by small and medium (Rs. 630), and very large (Rs. 420) categories of households. Overall, it was found Rs. 2340 for the cost of other input. Apart from this, all the categorised group of households were not using secateurs, nylone net and scraping knife.

To patronize and identify the constraints the problems of lac growers

Utilization of synthetic and coupe system was not adopted by the households in the area. Households knew about these system but they did not adopted it. *Phunki* lac removal was adopted by 100% trained households as well as untrained. Out of total, 100 % of trained and 100 % of untrained households cultivated lac by pruning of lac host trees. Selection of good quantity brood lac practiced by 26% trained and 20% untrained households. Nearly 66% of trained and 37 % of untrained households adopted the technique of bundling of brood lac and tagging on plant. Only 23% of trained and 20% of untrained adopted brood lac treatments technique. 31% from trained household and 27% from untrained households use synthetic net.

The constraints faced by the trained households were depicted in Table 37. It was observed that the main problem of trained households was lac of finance for operating lac cultivation followed by climbing of lac host trees, problem of marketing facilities, shortage of brood lac and climate condition. In case of small category of households, the main problem was finance followed by climbing of lac host trees, problem of marketing facilities, shortage of brood lac and climate condition. In case of medium category of households, the main problem was finance followed by climbing of lac host trees, problem of marketing facilities, shortage of brood lac and climate condition. In case of large category of households, the main problem was found climbing of tree followed by finance, shortage of brood lac, climbing of tree and climate condition. In case of very large category of households, the main problem was finance followed by climbing of lac host trees, problem of marketing facilities, shortage of brood lac and climate condition.

The constraints faced by the untrained households were depicted in Table 38. It was observed that the main problem of untrained households was Shortage of brood lac for operating lac cultivation followed by Finance, problem of marketing facilities, climbing of tree and climate condition. In case of small category of households, the main problem was Shortage of brood lac for operating lac cultivation followed by Finance, problem of marketing facilities, climbing of tree and climate condition. In case of medium category of households, the main problem was climbing of lac host trees followed by finance problem, marketing facilities, Shortage of brood lac and climate condition. In case of large category of households, the main problem was found Shortage of brood lac for operating lac cultivation followed by marketing facilities, problem of climbing of tree, Finance and climate condition. In case of very large category of households, the main problem was Shortage of brood lac for operating lac cultivation followed by Finance, problem of marketing facilities, climbing of tree and climate condition.

ABSTRACT

The present investigation has been conducted on one of the major contaminants and a myco-parasitc fungus *Trichoderma* infecting various cultivated mushrooms in and around Ranchi (Jharkhand). The objective of the study was to identify some potent herbal formulations, particularly Neem-based bio-agents, by *in vitro* testing of formulations like Indo-Neem, Maha Neem, Neem Herbal, Herbal Suddhi, Nimyle, and Well Guard for their bio-efficacy against the pathogen *Trichoderma viride*. The bio-efficacy of the formulations was tested by poisoned food technique for their ability to restrict the mycelial growth and sporulation of *T. viride* on PDA plates. Replicated experiments indicated that only Well Guard was able to effectively retard both growth and sporulation of *T. viride* at 10^{-3} &10^{-4}acquous dilutions of the formulation, while Nimyle and Maha Neem were very feebly effective to restrict the pathogen at such lower dilutions. Rest of the bio-agents like Indo-Neem, Neem Herbal, and Herbal Suddhi, were ineffective against *T. viride* at dilutions tested during the experiment. Therefore, only Well Guard and Nimyle were selected as potent bio-agents against the myco-parasite *T. viride* and were further tested against two cultivated mushrooms, *viz. Pleurotusflorida,* and *Hypsizygousulmarius* at 10^{-3} &10^{-4} dilutions so as to identify the safe dilution of the potent formulation for their use in crops of mushrooms, so that the bio-agents may be used to restrict *Trichoderma viride* without any harmful effect on the growth and production of the mushroom species. Replicated *in vitro* studies on the two mushrooms by the same poisoned food technique indicated that Well Guard at 10^{-4}dilution might be safely used to manage the

Green mould fungus *T.viride* without any adverse effect on both the mushrooms, if further *in vivo* studies on their spawn preparation and crop-production are carried out. Significantly, in the present study Well Guard, which is being currently promoted as a Growth-promoting formulation containing a mixture of amino-acids and short chain polypeptides has now been identified as a potent bio-control agent for controlling a pathogenic fungus like *Trichoderma viride* causing havoc in button mushroom industry the world-over. Nevertheless, other bio-formulations tested during the study require to be further evaluated for their bio-efficacy against *T.viride* at concentrations higher than those tried during the present investigation.

Keywords : *Trichoderma*, Bio-agents and Oyster mushroom.

INTRODUCTION

In India, mushroom cultivation started only during the last century, as the Paddy straw mushroom *Volvariella volvacea* was first cultivated on paddy straw in 1940s at Coimbatore (Ahlawat*et al*, 2005) later in 1962, *Pleurotus flabellatus (Dhingri or oyster)* was successfully cultivated on paddy-straw in Mysore (Srivastava and Bano,1962). Mushrooms are grown on organic residues, from which the mushroom mycelium draws nourishment through enzymatic degradation. In this process, they face competition as well as pathogenic attacks by various fungi, bacteria, insects etc, which hamper their growth and fruiting. Studies have shown that such problems might occur at various stages. These might occur in cultures, in spawn, on mushroom beds or even on mushroom sporopheres and cause damage and loss, and their good accounts are available in the litsature (Verma 2011).Cultivation of mushroom, however, faces several problems like diseases caused by viruses, bacteria, and fungi, and infestation by insects, and mites. Of these *Trichoderma spp*. cause major problem for mushroom farming. This problem is not restricted to India alone, but spread all over the world. Some *Trichoderma* strains have developed the capability to resist some chemical fungicides, and hence several countries have banned the use of some systemic chemical fungicides in mushroom cultivation. Therefore, people are now looking for alternatives like bio-fungicides or herbal formulations, etc. for combating this wide-spread disease of mushrooms.

Neem based bio-pesticide have shown great potentials in the management of insect-pests, and some such products have also shown efficacy against microbial contaminants. It was therefore, proposed to screen different Neem-based and other commercial herbal formulations available in the market for their efficacy against *Trichoderma*, a common pathogen of mushroom cultures, spawn, beds and even the sporocarps causing huge losses to mushroom producers at every step.

METHODOLOGY

1. **Selection of Bio-Formulations :-** For this experiment I select some potent neem based or bio-agents which are available in Ranchi market i.e. Maha Neem, Indo-Neem, Well Guard, Nymile, HarbalSuddhi and Neem Harbal.
2. **Growth-Dynamics studies on *pleurotus florida, hypsizygus ulmarius* & *trichoderma viride* as influenced by respective bio-formulations:** With a view to study the growth dynamics of *Trichoderma viride* as influenced by selected six Bio-formulations, replicated experiments were laid to grow the fungus in PDA plates impregnated with different dilutions of the selected bio-agents by poisoned food technique. An untreated control without any bio-formulation was also plated. Later, only potent bio-formulation was used to test its effect on the mycelial growth of the two mushroom fungi by the same technique and procedure.
3. **Poisioned Food Technique :**In this technique, the selected bio-agents were mixed in the culture medium at different dilutions, when the sterilized agar-medium was still in molten state but cooled to around 47-50 C, so that there was no adverse effect on the efficacy of the bio-agents. The test-fungi were later inoculated in the centre of the

plates, when the medium got cooled and solidified. An untreated control was also laid by the same procedure except that no bio-agent was added in those plates.

A. TO PREPARE SERIAL DILUTIONS OF DIFFERENT BIO-AGENTS

To prepare the serial dilutions (10^{-3}, 10^{-4}, and 10^{-5}) of the Bio-formulations, 9 ml of distilled water was taken in several test-tubes, and they were sterilized at 15 lb p.s.i. pressure and were left to cool down to room temperature. Thereafter, 1 ml of the bio-product was added into the 1st .test- tube containing 9ml of sterilized distilled water with the help of a sterilized pipette and was well shaken to get 10^{-1} dilution of the Bio-formulations. Thereafter, 1 ml of 10^{-1} dilution was transferred to the 2nd test-tube containing 9ml of sterilized distilled water and shaken properly to prepare the 10^{-2} dilution of the bio-agents Likewise 10^{-3}, 10^{-4} and 10^{-5} dilutions ofdifferent bio-agents were prepared for their use in the growth dynamic studies on different test-fungi.

B. INOCULATION OF TEST-FUNGI ON POISONED MEDIUM

To inoculate the test-fungi on poisoned PDA medium, sterilized 100 mm dia. Petri-plates were taken and 1 ml of serial dilutions of different bio-agents were taken in the centre of the plates and the molten PDA medium (cooled to about 47 C)was slowly poured into the plates with sterile precautions. The plates were then gently rotated and left for 10-15 minutes to solidify. Small bit of pure culture mycelium of thetest-fungus was inoculated in the centre of each plate and incubated at 28± 1 C in BOD incubator. For each dilution of every bio-agent, 5 replicates were prepared, along with 5 replicates of control plates without any treatment. These culture plates were observed every day to record the radial growth, and days for filling the plate. For *Trichoderma viride*extent of sporulation was also recorded as radius in cm of sporulating zones in each plate.

C. STUDY ON THE EFFECT OF BIO-AGENTS ON GROWTH DYNAMICS OF TEST-FUNGI.

The treated and control plates were incubated in BOD-Incubator placed randomly in CRD at 28± 1 C and were observed every day to record the radial mycelial growth in cm till the plates were fully covered. For *Trichoderma viride,* the sporulating-zones were also measured daily as radius in cm. The data were tabulated and put to statistical analysis under CRD for testing their significance.

RESULT AND DISCUSSION

Two out of six bio-formulations tested exhibited inhibitory effect on mycelial growth and only one viz. Will Guard inhibited both growth and sporulation of Trichoderma viride (Safer doses of Well Guard (10^{-4} and 10^{-5} dilution)). Whereas Nimyle bio formulation are inhibiting the growth of mushroom mycelial and the dilution 10^{-4} and 10^{-5} dose not any inhibiting effect on mushroom mycelial growth. A perusal of data recorded in Table 1.1 and 1.2 as radial mycelial growth and sporulation growth of the fungus and the growth-pattern indicated that all Well Guard dilutions used in the experiment containing 1.5, 0.15 and 0.015 ppm Azadirachtin were highly effective to retard the mycelial growth of *T. viride* up to 3rd days of incubation, while at 1.5 ppm concentration, it retarded the growth till 5th day. Thus, that product was found to be most potent formulation to check the growth of *T. viride* during its vegetative phase. A perusal of data recorded in Table 1.1 and 1.2 as radial mycelial and sporulation growth of the fungus *T. viride* and the growth pattern exhibited that the Nimyle dilutions 10^{-3}, 10^{-4}, and 10^{-5} had only a little effect on the mycelial growth of *T.viride,* since the mycelial growth attained in treated as well as untreated control plates differed significantly only on 2nd day at 1.5 ppm and 0.015 ppm concentrations. Such little effect of Nimyle against *T. viride* recorded during the present experiment might be due to lower content of Azadirachtin in the original formulation, although the actual concentration of Azadirachtin in the formulation is not indicated.

A perusal of data in Table 1.3 recorded as radial mycelial growth of *P. florida,H. ulmarius* and *C. indica* indicated that the dilutions (10^{-3}, 10^{-4} and 10^{-5}) of Well Guard used in the experiment had significant effect on mycelial-growth of the mushroom *P. florida*and *H. ulmarius* as there was no significant difference between growth in treated and

untreated plates of *C. indica* mushroom mycelium. Mahto and Verma (2008) also recorded no adverse effect of Venguard on mycelial growth of *Pleurotusflabellatus* both *in vitro* and *in vivo* studies. T= Treatment, T.V = *Trichoderma viride*, P.F = *Pleurotusflorida*, H.U= *Hypsizygousulmarius*, C.I = *Calocybeindica*.

CONCLUSION

The present investigation has been conducted on one of the major contaminants and a myco-parasitc fungus *Trichoderma* infecting various cultivated mushrooms in and around Ranchi (Jharkhand). Therefore, only Well Guard and Nimyle were selected out of sex bio agents as potent bio-agents against the myco-parasite *T. viride* and were further tested against three cultivated mushrooms, *viz. Pleurotusflorida*,*Hypsizygusulmarius*and *C. indica* at 10^{-3} &10^{-4} dilutions so as to identify the safe dilution of the potent formulation for their use in crops of mushrooms, so that the bio-agents may be used to restrict *Trichoderma viride* without any harmful effect on the growth and production of the mushroom species. Replicated *in vitro* studies on the three mushrooms by the same poisoned food technique indicated that Well Guard at 10^{-4}dilution might be safely used to manage the Green mould fungus *T.viride* without any adverse effect on both the mushrooms,

ABSTRACT

The concept of using aquatic plants for different purposes is receiving special attention nowadays. Azolla pinnata is a branched free floating aquatic fern. With the increasing demand in agriculture it has become important for us to increase the productivity by using various fertilizers. But with the dreadful use of these products the soil has been affected badly because of the depletion in the essential minerals of the soil. So to overcome this problem it has become important for all of us to use a different remedy for the production of various fertilizers. Of different fertilizers, liquid fertilizers are again a special class of fertilizers, hold very strong promise in protected cultivation. The liquid fertilizers, as special class of fertilizers provide an enormous possibility of accommodate nutrient use across critical growth stages, a mandatory for better nutrient-use-efficiency. Being readily water soluble components present in Azolla acts as soluble fertilizers help fertigation. So, an attempt has been taken to analyse the impact of water soluble component of Azolla pinnata on alteration of both physico-chemical and elemental content of soil. An attempts were taken to use the water soluble components of Azolla pinnata as a biofertilizer. The novelty of this work is the utilization of water soluble component in an environment friendly way. This research address the research gap by analyzing the Azolla pinnata as a water soluble fertilizer. In the present study it was found that the Azolla pinnata contains different useful elements which is major and minor element for plant nutrient. In the present study, water soluble component of dry Azolla pinnata was added to the garden soil and both initial and final physico-chemical parameters and elemental contents of soil were analyzed. It was observed that the soil which were treated with water soluble component of Azolla pinnata contained more nutrient than the normal garden soil. So water soluble

components of Azolla pinnata can be recommended as organic fertilizer which can fulfil the nutrient level of soil and enhance the soil fertility.

Keywords: water soluble component of Azolla pinnata, soil, Physico-chemical parameters, , Elemental content.

INTRODUCTION

India is poised to play a major role in increasing the utility of land water and other natural resources to compete with the increasing rate of population. Farmers today are faced with challenging of meeting and ever increasing demand for a white range of high quality and safe foods. Intensification of agriculture by irrigation and enhanced use of fertilizers may generate pollution by increased level of nutrients in underground and surface waters. By using bio-fertilizer which are made from natural sources increases the fertility of soil and also productivity of crop. Liquid fertilizer is a special kind of fertilizer that help in fertigation. Fertigation is the technique of supplying dissolved fertilizer to crop through an irrigation system. Small applications of soluble nutrients saves labour, reduces compaction in the field, thereby enhancing productivity. *Azolla pinnata* is one of the aquatic plants with high biomass and protein production which can be used as a fertilizer in agriculture [1]. Nutritive value of *Azolla pinnata* is well documented and promotes it as a good source of protein as it contains around 21-23% crude protein It is also found to contain essential minerals like Iron, Calcium, Magnesium, Potassium etc. and appreciable quantities of Vitamins A and Vitamin B-12 .[2] It is considered to be the most promising because of the ease of cultivation, minimal water for propagation, high productivity and good nutritive value [3, 4]. Nitrogen is the most limiting factor in crop production and it is essential for growth, protein manufacture and yield. *Azolla pinnata* fern is prevalent worldwide and has been used over centuries for fertilization in paddies as a source of nitrogen. By *Azolla pinnata* nitrogen fixation occure which enhance the growth of plants. Thus, use of water soluble fertilizer such as *Azolla pinnata* is a good alternative to inorganic fertilizers. The organic residue produced from any plants or animal origin has play important role in changing soil quality. The organic material affect the soil physically [5], soil nutrient content and faunal diversity of soil [6]. As we know that bio-fertilizers are the major source to enhance the growth and development of plants, So in this study water soluble fertilizer from *Azolla pinnata* was analyzed and physico-chemical parameters of both garden soil and garden soil treated with water soluble component of *Azolla pinnata* was compared for knowing either that is beneficial or harmful for environment.

MATERIALS AND METHODOLOGY

In this study, soil samples were collected from a garden of Centurion University of Technology and Management, BBSR, Odisha, at depths of 18 cm using soil auger. The samples were collected in a polyethylene bags and properly labelled. Then the collected samples were taken to the laboratory and treatment was done for the preservation of soil and further analysis has been done as per standard procedure[7]. The collected samples were air dried in sun light for about twenty four hour. Then the samples were dried in an oven at 105˚C till complete dehydration. Then the sample was ground in a mortar pestle then passed through 0.5 mm nylon mesh sieve. These soil samples were again packed with the complete labelling and preserved for further analysis. *Azolla pinnata* were collected from botanical garden of Centurion University of Technology and Management, Bhubaneswar, Odisha. The physico-chemical parameters like pH, E.C., soil moisture percent (%), water holding capacity of soil and elemental content of both soil and water soluble component of *Azolla pinnata* were analyzed using standard methods.

STATISTICAL ANALYSIS AND PRESENTATION OF DATA

All the experiments were done in triplicates and the data presented in the figures are the means of three independent experiments. The data were analyzed statistically and standard errors of mean (SEM) were given wherever required.

RESULTS AND DISCUSSION

Physico-chemical parameters of elemental analysis of soil: The physico-chemical parameters like pH, Electrical conductivity (E.C), soil moisture content (%), water holding capacity (W.H.C), and different elements/compound contents present in garden soil and garden soil treated with water soluble component of *Azolla pinnata* were analysed.

pH: The pH values of the soil sample collected from our college garden area was found within 7.6 to 7.8. So the soil sample was considered to be basic. After addition of water soluble component of *Azolla pinnata* it was found to be 6.8 to 7.2 which indicates that the water soluble component of *Azolla pinnata* neutralizes the alkaline soil. Then after addition of water soluble component of *Azolla pinnata* it was found to be decreased.

Electrical conductivity (E.C): The conductivity values in the soil samples of the area under study were found to range from0.813 mho/cm to 0.822 mho/cm. After addition of water soluble component of *Azolla pinnata* it was found to be 0.892mho/cm to 0.971mho/cm. Then, after addition of *Azolla pinnata* soluble component it was found to be increased.

Soil moisture content: At pre-monsoon period moisture content were found in the range of 8.0% to 10.2% whereas at post-monsoon period it was ranged from 10.0% to 11.7.0%, which indicated that the moisture content present in soil of the area is suitable for crop production. After addition of water soluble component of *Azolla pinnata* it was found to be increased that is from 12% to 14% .

Water holding capacity (W.H.C): Soil water holding capacity is a term that all farms should know to optimize crop production. When there is a difficult in the amount water in the soil, the soil profile needs to be replenished by precipitation or irrigation. In the study the soil had range between 156.55 to 158.58. After addition of water soluble component of *Azolla pinnata* it was found to be 159.19 to 162.16. After addition of water soluble component of *Azolla pinnata* it was found to be increased.

Elements/compound contents: In this study, elemental analysis of soil had been done in the basis of XRF (X-ray fluorescence). The soil was found to be contained many elements/compounds i.e given in table. There are several elements and compounds were found to be present in water soluble component of *Azolla pinnata* which enhanced the nutrient level of garden soil. After addition of water soluble component, concentration of different valuable elements like P_2O_5, SO_3, Cl, K_2O, CaO and Rb_2O were found to be increased which enhanced the soil nutrient level. In a study it was reported that the application of egg shell waste enhances the soil fertility [8]. In another study, it was reported the application of compost act as fertilizer on growth of onion, on barley. From another experiment, it was found that, the tea dust waste compost are highly desirable for plant growth [9], it was also found that *Azolla pinnata* is beneficial to wheat when applied in a rotating rice-wheat cropping system [10]. The presence of some metals like copper, zinc, iron, manganese, molybdenum and nickel are essential micronutrient for plant growth [11]. Similarly, small amount of different metals enhance the plant growth like nickel in *Macrotyloma uniflorum* [12]. Compost prepared from organic waste [13] increases soil organic matter on land [14] and provide plant nutrients in slowly available form [15]. Similar results were also reported in growth of peanut crops grown with water soluble component of *Azolla pinnata* treated soil [16].

CONCLUSION

Azollla pinnata can be used as water soluble fertilizer due to presence different valuable macro and micro nutrient for plants. In the present study , it was found that the water soluble component treated soil contains much more nutrient than the normal garden soil. So this research can say that water soluble component of *Azolla pinnata* can fulfil the

mineral requirement for the plants growth. Overall it is an excellent organic manure for plants. It can be recommended for utilization at crop field for better growth and development of plant without causing any harm to the plant as well as soil.

ACKNOWLEDGEMENT

We are thankful to Centurion University of Technology and Management for providing lab facility during the investigation.

ABSTRACT

Parthenium hysterophorus L. is considered as one of the harmful weeds because of its invasiveness, rapid multiplication rate and adverse impacts on environment and human health. The novelty of this work is to manage the weeds by employing organic matters instead of harmful chemical weedicides which have an adverse environmental impacts due to accumulation in soil and leaching to water bodies. Researchers have studied the allellopathy impact of both the plants, However there is little report available on the use of this extract as natural herbicide. This study was carried out to assess the allellopathic effect of the aqueous extract of leaves of *Eucalyptus globulus* Labill. and *Hyptis suavolence* L. on the control of noxious weed *Parthenium historephorus* L. The extracts of both the leaves were used in same concentration (00 % - 100%) and their impact on seed germination and growth of seedlings were observed. The results obtained from utilizing *Eucalyptus globulus* Labill. extract showed more effective in terms of germination, seedling growth, seedling vigour indices and tolerance indices in comparison with *Hyptis suavolence* L. leaf extract. The experiment also showed complete inhibition in germination of seed. The current study gives an idea about the use of organic products from plants considered as better alternatives to harmful synthetic herbicides which is the eco-friendly way to biocontrol the weeds to reduce environmental pollution.

Key words: Biocontrol, Parthenium, Allelopathy, Eucalyptus, Hyptis

INTRODUCTION

Weeds are an important issue which influence the production of crop through competition for availing nutrition from environmental resources and cause productivity loss [1]. Weeds are also responsible for degradation of environment in terms of threatened the biodiversity [2]. *Parthenium histerophorus* L. is one of the harmful and allergy causing weeds which is resistant to traditional methods of weed management due to its invasiveness and rapid spreading potential. *Parthenium hysterophorus* L. has spread in land area about 35 million hectares in India [3]. As *Parthenium hysterophorus* L. affects natural ecosystem like agriculture, human and animal health so it is the need of the day to find out the management options for *Parthenium hysterophorus* L.. There is ever-increasing interest globally for reducing the use of synthetic herbicides in the all sectors to reduce the herbicide level in human diet [4]. This weed has been managed by continous use of chemical herbicides by which causes environmental pollution is much more. There is another approach like allelopathy is an eco-friendly and a viable option. Allellopathy is the beneficial or harmful effects of one plant parts on another through the liberation of certain chemicals into its surroundings [5]. The allelochemicals affect in crop/weed by interactions for availing nutrients [6]. Application of allello-chemicals is an actively precious and sustainable management process managing weeds. *Eucalyptus globulus* Labill. is important tree species, which are extensively spreads in tropics and subtropics region shows allellopathy potential. Another species *Hyptis suavolence* L. is also having the property of allellopathy potential [7].

The use of herbicides globally is approximately 48 % of the total output of different pesticides like herbicide, fungicide and insecticide [8]. China produced herbicide approximately 1.77 million tons which is the 55 % of total output of different pesticides used in agriculture [9]. Hence a comparative study was undertaken to study the allellopathic potential of aquous leaf extract of Eucalyptus and *Hyptis suavolence* L. on controlling *Parthenium hysterophorus* L. Current research is focused on the weed management by using an effective biocontrol method by using plant extracts as an ecofriendly and cost effective alternative for replacement of synthetic weedicides in weeds management. The present study is aim to explore the use of plant extracts as one of the future solutions for the use of a natural, cost effective and eco-friendly approach for an effective alternative in the weed management like *Parthenium hysterophorus* L..

MATERIALS AND METHODS

Seeds of *Parthenium hysterophorus* L. were collected from road sides and near agricultural fields of Khordha district, Odisha where the plants grown densely. The seeds which were healthy and free from pathological conditions were collected and repeatedly washed in tap water to remove adsorbed dust particles. The seeds were left for one day and then soaked the water by using tissue paper until dry and then kept in a plastic container for further use. For allelopathy study, two allelopathic plants: *Eucalyptus globulus* Labill. and *Hyptis suavolence* L. were selected for the preparation of extract. Stock solution of aqueous leachates of selected plants were prepared by using distilled water (1:10 w/v) for 24 hours and filtered the aquous extract by using Whattman No.1 filter paper. This stock extract was diluted with distilled water to prepare required concentration (00% to 100%) of leachate. Four replicates of each 50 healthy seeds of *Parthenium hysterophorus* L. were placed on extracted treated germination paper in properly sterilized petridishes. The petridishes were maintained at 26°C and 94 % humidity with exposure to 20 ml of different concentration of aqueous leachates of extract and distilled water for comparison as control.

Percentage of germination (G %) was calculated by the formula [10].

$$G\,\% = \frac{\text{Total no. of seed germinated}}{\text{Total no.of seed tested}} \times 100$$

The percentage of phytotoxicity of the was calculated by the formulae suggested by Chou et. al (1978) [11].

$$\text{Phytotoxicity (\%)} = \frac{\text{Radicle length of control} - \text{Radicle length of test}}{\text{Radicle length of control}} \times 100$$

According to Baki and Anderson (1973) [12] Seedling vigour indices (SVI) were calculated by using the formulae:
SVI = Germination percentage × Radicle length

According to Turner and Marshal (1972) [13], The tolerance indices (TI) of the seedlings were calculated by using the formula:

$$TI = \frac{\text{Radicle length of seed intest}}{\text{Radicle length of control}} \times 100$$

STATISTICAL ANALYSIS

The statistical implication of various paremeters were studied utilizing one way Annova by MS-Excel. The p-value less than 0.05 implies significant contributions.

RESULTS AND DISCUSSION

The effect of leaf extract of both *Eucalyptus globulus* Labill. and *Hyptis suavolence* L. showed that the percentage of germination was significantly decreased with increasing concentration of leachate. Similarly the radicle length of the seedling were also found to be decreased significantly with increasing concentration of leachate of both the extract. The other paremeters like Seedling vigour indices and tolerance indices was also found to be decreased whereas the level of phytotoxicity was found to be increased with increasing leachate concentration of both the leaf extract. But the *Eucalyptus globules* Labill. leaf extract showed better result in comparison with hyptis leaf extract. The data of the present study are presented in table-1 and 2. The results were in argument with the findings of a research [14 & 15] that the aquous extract of different plant showed a negative effect on the seed germination and seedling growth of all weeds studied. In another study, reduction in seedling growth was also reported under allellopathy stress [16 & 17]. Similar result on the growth of tomato, radish, cucumber and banyard grass was found with the application of *Lantana camara* extract [18]. Based on the presented research results, it was found that the use of the leaves of both plant species are alternative to using weedicides to control *Parthenium hysterophorus* L. but *Eucalyptus globulus* Labill. was found to be more effective than the *Hyptis suavolence* L.

CONCLUSION

The aqueous extract of *Eucalyptus globulus* Labill. leaves produced better inhibiting effect than the *Hyptis suavolence* L. leaves on seed germination and seedling growth, hence the *Eucalyptus globules* Labill. leaves extract can be used in eco-friendly, cost effective and bio-control method for weed management like *Parthenium hysterophorus* L.. More future studies are required to find the inducing agents which are responsible for these inhibition of germination.

ACKNOWLEDGEMENT

We are thankful to Centurion University of Technology and Management for providing lab facility during the investigation.

ABSTRACT

Odisha is a state of India which is well known for production of mineral resources including metallic, non metallic and fuels. In a mining area, ecological disturbance occurs due to deposition of different types of pollutants during excavation and extraction of mineral ores. Presently, water bodies of the Talcher colliery areas are being contaminated with the hazardous pollutants discharged into it by the mines' waste waters, which pose a constant threat to the human health and live-stock. This study aims to assess the impact of colliery pollutants generated from different coal mines of Talcher mining area on nearby water bodies including both surface water as well as ground water. In this study, water samples were collected from different sources of surface water as well as ground water present in and around Talcher colliery areas. Different physico-chemical parameters such as pH, Electrical conductivity, Total dissolved solids, Total suspended solids, Total hardness, Total alkalinity, Calcium, Magnesium, Fluoride, Chloride, Iron, Total Chromium and Total Nickel content of water were analysed. The results of this investigation indicated that the migration of colliery pollutant leads to hydrological pollution with increasing level of total dissolved solids, fluoride concentration and also some heavy metal pollutants like iron and chromium which leads to health hazards of both plants and animals.

Keywords: Coal mining, Physico-chemicals parameters, Water, Odisha

INTRODUCTION

Odisha is a state of India has huge mineral resources and also produces enormous minerals including non-metallic, metallic and fuel minerals. Odisha state has two coalfields i.e. Ib-River Coalfield and Talcher Coalfield. In mining areas, some ecological disturbances always occur which is induced by mined-out region. Heavy metals occur in the soil in soluble form and in combined state. However, only soluble, exchangeable and chelated metal species in soils are mobile and hence more available in water [1].

Water is essential for life but it transmits diseases in plants and animals. Many of the people are exposed to unsafe level of chemical contaminants in their drinking water [2]. Water in its natural state may not be pure since it is a universal solvent with the ability to dissolve numerous chemicals and thus carry a lot of impurities that can be injurious to health if it exceeds tolerance limit [3]. The natural quality can vary from one rock type to another and also within aquifers along its flow paths. There is also possibility for chemical reactions between the water and rock material through which its flow depending on the flow path [4]. According to [5] and National academy of science [6] over one billion people lack access to clean and safe water. The available fresh water to man is hardly 0.3-0.5% of the total water available on the earth [7]. Many people in the world especially majority of which live in rural areas among the poorest and most vulnerable do not have access to safe and clean drinking water [8]. Therefore, it is necessary to identify the hazardous pollutants and remove it from the polluted places. The present investigation was undertaken to estimate the changes in various water quality parameters due to coal mining at Talcher mining areas of Odisha, and to check either it is suitable for human health or not.

MATERIALS AND METHODS

Geographical location of the Study area: Talcher coalfield constitutes the south eastern part of the Lower Gondwana Mahanadi Master Basin and occupies an area of over 1813 sq. km. The coalfield is in between 20°50' and 21°15' N latitude and 84°09' and 85°33' E longitudes and is mainly consists of the Brahmani River Valley. It covers Dhenkanal and Angul districts along with a small portion of adjoining Sambalpur district of Odisha. For the present study, ten water sources were selected namely (i) Talabera village (well water), (ii) Rakas village (well water), (iii) Hensmul village (well water), (iv) Dera village (tube well water), (v) Jilinda village (well water), (vi) Naraharipur village (pond water), (vii) Old quarry at Jagannath colliery area, (viii) Mine discharge water at confluence with Bangarunala, (ix)Mine discharge water at Jagannath Colliery and (x) Pond water near Bharatpur Colliery. These water bodies are surrounded by mining pockets, human settlements, some industries and agricultural fields. Some of these sites had received partially treated effluent from the mining units located near to it.

Collection of water samples: Water samples were collected from different sampling sites; surface water collected from nearby streams, rivers, ponds and quarries while ground water collected from nearby wells and tube wells. Composite water samples were collected from the all ten water sources in pre-sterilized plastic cans/bottles according to standard methods of [9]. Representative water samples were analysed for different physico-chemical parameters as well as pollutants concentrations in School of Applied Sciences, Centurion University of Technology and Management, Odisha.

Analysis of physico-chemical parameters: The standard methods were followed for analyzing physico-chemical parameters and metal contents (total chromium, total nickel and total iron) in water. The analyses of different parameters of water were made by standard methods recommended by [9] and [10]. Temperature and pH were measured at sampling sites with the help of digital portable kit. All the collected samples were brought to the laboratory and stored at 5 ± 1 °C and analysis of various parameters following standard methods.

RESULTS AND DISCUSSION

Results of analysis of different physico-chemical parameters of ground and surface water samples of selected sites of Talcher colliery area are presented in Table 1 & Table 2.

pH: The pH values in ground water as well as surface water were found mostly confined within the range of 6.0 to 8.1. The pH values of most of the samples are well within the limit prescribed by [11] for various uses of water including drinking and other domestic supplies.

Electrical Conductivity: The measurement of electrical conductivity is directly related to the concentration of ionized substance in water and may also be related to problems of excessive hardness or other mineral contaminants. The conductivity values in both surface and the ground water samples were found to range from 360 μS/cm to 980 μS/cm.

Total dissolved solid: In natural water dissolved solids consists mainly of inorganic salts such as carbonates, bicarbonates, chlorides, sulphates and nitrates of calcium, magnesium, sodium, potassium, iron etc. and a small amount of organic matter and dissolved gases. In the present study the values of total dissolved solids (TDS) in the ground water were in the range of 232 mg/L. to 584 mg/L and surface water ranged from 384 to 648 mg/L.

Only one ground water sample and three surface water samples were found above the desirable limit of 500 mg/L but well within the maximum permissible limit of 2000 mg/L (Table 2 & Table 3). The TDS content at ground water was comparatively lower than the surface water which might be due to more mineralization of surface water as compared to the ground water. Water containing more than 500mg/L of TDS is not considered desirable for drinking water supplies, though more highly mineralized water is also used where better water is not available. For this reason, 500 mg/L is accepted as the desirable limit while 2000 mg/L as the maximum permissible limit has been suggested for drinking water [11]. However, it is reported that water containing TDS more than 500mg/L caused gastro-intestinal irritation [11].

Alkalinity: The presence of carbonates, bicarbonates and hydroxides are the main cause of alkalinity in natural waters. Bicarbonates represent the major form since they are formed in considerable amount from the action of carbonates upon the basic materials in the soil. In the study sites the alkalinity value in ground water was varied from 148 mg/L to 282 mg/L while in surface water from 216 mg/L to 394 mg/L. The alkalinity level of three ground water samples and all surface water samples were found crossed the desirable limit of 200 mg/L but are within the maximum permissible limit of 600 mg/L. The high alkalinity value at some locations may be due to the action of carbonates upon the basic materials in the soil.

Total hardness: The total hardness is the sum of concentration of alkaline earth metal cations present in the water. It is due to presence of Calcium and Magnesium ion in water [12]. Calcium and Magnesium along with their carbonates, sulphates and chlorides make a water hard. A limit of 300 mg/L has been recommended for potable water. The total hardness of the collected water samples in the study area were within the range of 83 mg/L to 306 mg/L. As evident from the results no ground water sample and one surface water sample had exceeded the desirable limit of 300 mg/L but not crossed the maximum permissible limit of 600mg/L.

Calcium hardness: Calcium hardness is an important component of the carbonic buffer system. It is also cycle through biotic and abiotic components of the ecosystems. Calcium hardness originates from natural processes is a dissolvent of minerals which contains calcium and other sources such as industrial wastes and agricultural wastes but found nontoxic. The desirable limit for calcium is 75 mg/L [11]. In the study area the values of calcium in ground water were estimated to vary from 38 mg/L to 85 mg/L and in surface water from 56 mg/L to 99 mg/L.

Magnesium hardness: Magnesium hardness is an important component of total hardness, which originates from different processes such as mining activities, degradation of rocks etc. It is also cycled through biotic and abiotic components of the ecosystems. The desirable limit for magnesium is 30 mg/L [11]. In the study area the values of magnesium in ground water were varied from 11 mg/L to 27 mg/L and in surface water ranged from 18 mg/L to 51 mg/L.

Chloride: The chloride content in water of the study area was quite low and varies from 14 to 65mg/L. No sample in the study area had crossed the desirable limit of 250 mg/L [11]. The limits of chloride have been laid down primarily from taste considerations.

Fluoride: The fluoride content in water of the study area was found within the range of 0.1 mg/L to 2.1 mg/L. However, two surface water samples in the study area were found crossed the desirable limit of 1.5 mg/L [11].

Sulphate: The sulphate content in water generally occurs as soluble salts of calcium, magnesium and sodium. The content of sulphate changes significantly with time during infiltration of rainfall and ground water recharge, which mostly takes place from stagnant water pools and surface runoff water collected in low laying areas. The concentration of sulphate in the study area varied from 31 mg/L to 147 mg/L in all the samples falling within the desirable limit of 200 mg/L.

Nitrate: Nitrate content in drinking water is considered important for its adverse health effects. The occurrence of high levels of nitrate in ground water is a prominent problem in many parts of the country. The nitrate content of water in Talcher area varied from 4 mg/L to 43 mg/L in all samples falling within the desirable limit of 45 mg/L [11]. A nitrate is an effective plant nutrient and is moderately toxic. Its concentration above 45mg/L may prove detrimental to human health. In higher concentrations, nitrate may produce a disease known as methanoglobinemia (blue babies) which generally affects bottle-fed infant, repeated heavy doses of nitrate on ingestion may also cause carcinogenic effect.

Heavy metals: The contamination of ground water by heavy metals has received enormous attention during recent years due to their toxicity and accumulative behaviour. These elements contrary to most pollutants are not biodegradable and undergo a global eco-biological cycle in which natural water are the main pathway.

Chromium (Cr): The maximum permissible limit for Cr in water is 0.1 mg/l. The values of Cr in four samples out of 10 were found within the desirable limits.

Iron (Fe): The desirable limit for iron in water is 0.3 mg/l. Iron has been considered to be an essential trace element for human and animal health. In the present study one ground water sample and two surface water samples were found to cross the desirable limit of 0.3 mg/l.

Nickel (Ni): The maximum permissible limit for Ni in water is 0.2 mg/l. Nickel has been considered to be an essential trace element for human and animal health. In living systems, it is associated with DNA and RNA molecules and also a regulatory element for the various enzyme systems [13]. It causes blindness both in human and animals, increased blood sugar level and serum cholesterol as well as local necroses in the liver tissue. Drinking water and food are the main sources of exposure for the general population with the average American diet containing about 300 µg Ni/d. In this present study the values of nickel in all water samples were below detectable limit of 0.01mg/L.

CONCLUSION

Water resources are often considered to play a vital role in ensuring social and economic development. The pace of urbanization and other anthropogenic activities including mining around the water bodies impose severe problems to physico-chemical environment of the water resource and the health of the ecosystem is deteriorating. The results showed that pH of all the samples of surface and ground water was within the permissible limits, whereas values of total dissolved solids, total hardness, fluoride content and some heavy metal contents like chromium and iron were found to be relatively higher than the desirable limits. Almost all the samples were found to be enriched with the selected toxic metals, whereas the concentration of nickel was found within the permissible limits. The concentration of selected toxic metals in the waste water of the study area, being used for the irrigation purpose, was found to be satisfactory but not suitable for drinking purposes.

ACKNOWLEDGEMENT

We are thankful to the authorities of Centurion University of Technology and Management for providing Laboratory facilities during the investigation.

ABSTRACT

A number of organizations that include consulting firms, brokerage firms, and government agencies often make forecast for sales of different products and services at industry level. Such publicly available forecasts along with data on past trends could be good starting point for sales departments to make forecast for their own company at different geographic levels. Machine Learning implemented through Artificial Neural Network method has emerged as an easier and popular approach to estimate future demands. This article takes data from two freely available sources on certain macro-economic indicators like Gross State Domestic Product, Growth Rate, Per Capita Income, and Total number of Households for eighteen states and two union territories of India and analyses their impact on AC ownership across these states using Artificial Neural Network method.

Keywords: Demand and sales forecasting, macro-economic indicators, Gross State Domestic Product, Growth Rate, Per Capita Income, Total number of Households.Machine Learning, Artificial Neural Network

INTRODUCTION

Background of the Study: Many consulting firms like pwc, and McKinsey, brokerage firms like Motilal Oswal and Edelweiss, and non-profits like India Brand Equity Foundation (IBEF), a Trust established by the Department of Commerce, Ministry of Commerce and Industry, Government of India, come out with demand forecasts for various industries from time to time. These reports are often available for free and are useful as starting points for sales forecasting using judgemental methods at individual firm level. However, due to the simple methodologies used in

the research behind these reports, the forecasts given by them should be used along with suitable statistical methods to improve the accuracy of the forecast. Artificial Neural Network is one such method that has gained popularity in recent years (Zhang 2004). This article takes data from one such publicly available data on the room air conditioner (AC) market in India (Oswal 2018) and certain macro-economic data on some Indian states (ESOPB 2020) to find if the variation in AC ownership across states has any relationship with the variations in the select macro-economic indicators. The Oswal (2018) report assumes that 'household owning refrigerators but not AC' and 'households owning washing machines but not AC' are potential customers for ACs. Though this assumption may seem tempting for the marketers, it may be fallacious.

This article looks into the impact of four select macro-economic indicators - Gross State Domestic Product (GSDP), Growth Rate (GR), Per Capita Income (PCI), and Total number of Households (TH) across eighteen states and two union territories in India, on AC ownerships (predicted AC sales PAC)

LITERATURE REVIEW

Demand and Sales Forecasting: Sales forecasting involves predicting the quantity of a product or service target customers will buy, given a marketing-mix program in a given time period moderated by the market conditions. Accurate sales forecasting is important for any business entity for its planning at various levels (Armstrong 2008, Mentzer and Moon 2004, Efendigil, Önüt and Kahraman 2009, Chintagunta & Nair, 2011). Though lot of progress has been made in the forecasting techniques over the last few decades, business entities are yet to derive benefit from them as many of them rely on basic techniques and spread sheets (Canitz, 2016). The large number of available forecasting methods derive broadly from two sources – Judgemental and Statistical. Armstrong (2008) summarizes those methods and their interrelationships in Figure 1.

Organizations and their sales teams often use various Judgemental methods as they are perceived to be easier to use. However, there has been an increasing trend to integrate both the judgemental and the statistical methods (E.g., see Armstrong and Collopy 1998, Davydenko 2012, Bunn and Wright 1991, Webby and O'Conner 1996). Judgmental forecasts generally add contextual information for the final forecast. Given the right integration method, judgmental forecasts improve accuracy of the statistical forecast by proving additional information and the domain knowledge of the experts (Armstrong and Collopy 1998). However, as has been cited above, organizations often are not able to take the benefit of the advanced forecasting methods not because of judgemental methods, but because of the complexities of the statistical methods for them. For many of them, the Judgmental methods are often the primary forecasting tools. Rarely any one forecasting method will give a reliable estimate of future demands. It is advisable to use a number of judgemental and statistical methods and integrate the findings to improve the accuracy and reliability of the final forecast.

Use of Machine Learning in Demand & Sales Forecasting: Traditional statistical forecasting methods use time series data with the assumption that future demand can be estimated from past data statistically. This assumption may hold true in stable business environment, which is rarity. Many exogenous factors, which were not present in the past, could potentially influence future demand. To overcome this limitation, causal modelling methods have been proposed which work with such exogenous factors as macro-economic indicators, competitive strategies, natural forces etc (Chopra and Meindl2013). Cadavid, Lamouri and Grabot (2018) have argued that since Machine Learning can take different types of data and variables such as categorical variables, fuzzy variables, time series, text, image and other types of data, it can be said of providing causal modelling. Researchers have used machine learning for demand and sales forecasting through Artificial Neural Networks (ANN) for the last four decades for a variety of products and services (Cadavid, Lamouri and Grabot (2018).

With the increasing availability of software that use such advanced techniques as Artificial Neural Network (ANN), it has become easier to use this technique to forecast demand or find trends therein. Netto and Brei (2017) have argued that marketing research should: "combine different sources of data, such as free public data, firm property data, commercially available market research, big data, and primary data (e.g., surveys and experiments)." This article uses free public data to analyse the variations in the ownership of a white good – air conditioner in this case – across different states in India and its relationship with certain macro-economic indicators. The indicators chosen are total number of households (TH), Gross State Domestic Products (GSDP), Per Capita Income (PCI) and GSDP Growth Rate (GR).

Artificial Neural Networks: Artificial neural networks (ANNs) are biological nervous systems-inspired computational networks. In fact, an ANN is a first-order mathematical approximation to the human nervous system. It is a computational model with several processing elements. These elements take inputs and give outputs based on predefined activation functions. ANNs are used to solve various nonlinear problems. For a detailed discussion, please refer to Mishra and Datta-Gupta (2018).

Macro-economic Factors and Durable Goods Consumption: Durable goods consumption has been found to lead GDP over the business cycle. It is also an indicator of the future path the GDP may take. If durable goods consumption is found to be above its trend, then the GDP of the next quarter can also be expected to be above the trend (Carroll 2012). Similarly, increase in number of households has been found to correspond to the registration of new cars (Atkinson 1950). Growth rate of Gross State Domestic Product (GSDP) is an important parameter in the measurement of a state's economic performance and also contributes to the measurement of the performance of the country as a whole. It is defined as "a measure, in monetary terms, of the volume of all goods and services produced within the boundaries of the State during a given period of time, accounted without duplication" (data.gov.in 2015). The same source defines per capita income as: "Per capita income, also known as income per person, is the mean income of the people in an economic unit such as a country, state or district. It is calculated by taking a measure of all sources of income in the aggregate (such as GDP or Gross national income) and dividing it by the total population of country, state or district."

Indian White Goods Market: Product classification found in the textbooks generally does not further classify consumer durables. In the industry lexicon, they are further classified into two: 1) Consumer Appliances and 2) Consumer electronics. Consumer appliances are further divided into 1) White Goods, and 2) Brown Goods. However, this 'colorful' classification is not based on any clear-cut distinction among the two categories, except for the fact that historically, the white goods were made in white color, and brown goods in (dark) brown color. Though now a days these durables can be found in many different colors, the color-based category names have stuck.

Examples of white goods are washing machines, refrigerators and air conditioners. Brown goods examples are microwave ovens, cooking range, and vacuum cleaners, etc. Audio and visual systems, computers and peripherals, mobile phones, and gaming consoles, etc are put under consumer electronics. It is interesting to note that the Ministry of Statistics and Programme Implementation includes many more products, ranging from kitchenware, automobiles, gold and diamond gems and jewellery, readymade garments, footwear and even stationery items under consumer durables category in the Index of Industrial Production (IIP). However, the industry refers to only those goods as consumer durables that are generally associated with the use of electricity (Care Ratings, 2018). Despite India's climatic conditions, the penetration of domestic air conditioners is low (at about 4%) as compared to the global average of 30% (IBEF June 2019). AC penetration also lags other white goods like refrigerators (30-33%), air coolers (15-17%) and washing machines (10-11%) (HDFC Securities Nov 2019). However, there are many growth drivers which are expected to give a fillip to the sales of AC in India. Some of those factors are government focus on housing for all, rural electrification, power for all, easier access to credit, improving standard of living and changing lifestyles, higher disposable incomes, energy-efficient AC technology, and inverter-powered AC technology, etc.

OBJECTIVE OF THE STUDY

To analyse if the variations in the ownership of a white good, in this case AC, across states in India show any relationship with the variations across the states in terms of certain macro-economic indicators.

MATERIALS AND METHODS

Software used: The analysis of data for this article was done using the Pipeline Pilot module of Biovia, a proprietary software of Dassault Systemes of France. The software provides different built-in components to develop a machine learning model and use the same for prediction. The module uses data pipelining engine to execute data processing procedures which are developed within the Pipeline Pilot graphical authoring environment. The module thus helps in the development, standardization, and automation of scientific data management, analysis and reporting (Dassault Systèmes 2015).

Collection of data: Secondary data was collected from a 2018 report on room air conditioner market in India by Motilal Oswal Financial Services Ltd. The state wise macro-economic data was collected from the website of The Economic and Statistical Organization of Punjab. The reasons these reports were selected were their easy availability on the Internet and also availability of the data related to the study objective. Year 2011 was selected as the year of study to examine the relationships between the variations because this year was the last census year and data was available in the reports cited above. Those states whose data could not be found in both the reports were not considered for analysis. The states whose data was taken up are: Andhra Pradesh, Bihar, Chhattisgarh, Goa, Gujarat, Haryana, Jharkhand, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Odisha, Punjab, Rajasthan, Tamil Nadu, Telangana, Uttar Pradesh, and West Bengal, and the UTs of Delhi and Chandigarh. The data were normalized within the range of minimum and maximum for each parameter such that all the values lie between 0 and 1. The data were randomized and fed into a neural network model.

Development of deep learning neural network model: The normalized dataset was read using "Delimited Text Reader" component of pipeline pilot. The component was connected to the "Learn R Deep Neural Net Model" component. The output of the model was displayed using "HTML Table Viewer" component (Fig 2). The parameters for the "Learn R Deep Neural Net Model" component were set as shown in Figure 3. The setting for which the experimental output parameter and the predicted parameter were close to a 45^0 line were considered for the final model.

RESULTS AND DISCUSSION

GSDP Growth Rate and Predicted AC Sales: The chart in Fig 5 shows that higher the achievement of growth rate in GSDP of a state in the select list of states, higher is the ownership of ACs. But as the growth rate approaches the highest in the group, the number of AC ownership is slowing down and reaching a peak. This trend implies that the states with lesser achievement of GSDP growth rate present higher AC sales opportunities than the states with higher achievement of GSDP growth rate. So, the AC manufacturers should focus more on such states to build their markets.

GSDP and Predicted AC Sales: This chart (Fig 6) is in line with the previous one on growth rate of GSDP with the exception that the predicted AC sales is peaking up in the states whose GSDP is just above the median value. This implies that states with higher GSDP are mature markets for ACs. However, it is to be noted that this chart, as the other three, shows trend between AC ownership and GSDP of states keeping the other three macro-economic

factors under study constant. In other words, keeping the number of households, per capita income and higher achievement of GSDP growth rate constant, the AC ownership is found to be increasing with higher GSDP states till the median value, after which it is slowing and eventually coming down. It can be posited that states with higher GSDP are matured markets, and that beyond a certain level of GSDP, AC ownership is coming down as the indicator total number of household has been kept constant.

Per Capita Income and Predicted AC Sales: This chart (Fig 7) shows that states with higher per capita income (PCI) are having higher AC ownership and that with increase in PCI, the predicted AC sales will increase. This finding is in the expected line. So, AC manufacturers can pay extra attention to states with growing per capita income and should keep the impact of this indicator in mind while using the judgemental methods of demand estimation of their products state wise.

Total number of Households and Predicted AC Sales: Total households (TH) indicator (Fig 8) is found to be having a positive trend for predicted AC sales (PAC). In other words, increase in number of households would increase the AC ownership even when the other three indicators have been kept constant. This can be explained by the facts that factors like increased electrification, availability of energy-efficient star-rated ACs, availability of inverter-operated ACs, better invertors because of better battery technology and hotter climates are expected to spur the growth in the AC ownership.

CONCLUSION

Publicly available data could be useful for estimation of future demand. There are a number of judgemental and statistical methods for demand and sales forecasting. Suitable methods from both the categories could be used and integrated to improve the accuracy of the forecast. Macro-economic indicators are important in predicting future sales. Machine Learning using the Artificial Neural Network is an useful method of predicting sales using macro-economic parameters. This article has used four such indicators, viz, Number of Households, Gross State Domestic Product, Growth rate in GSDP, and Per Capita Income for eighteen states and two union territories in India to find trends in the AC sales. In the states with higher growth rate (GR) and GSDP, AC ownerships found to be saturating as compared to those with relatively lower values for these two indicators. The other two macro-economic indicators, i.e., total number of households (TH) and per capita income (PCI) were found to be steadily proportional to the AC ownerships.

Suggestion for Future Research: Further research can be done in case of other white and brown goods to find the impact of the macro-economic indicators used in this article or any other set or combinations of such indicators. Another useful research could be a model that could use the ownership data of one type of consumer durables by households, in addition to suitable other data, as input and predict sales of some other durable.

ABSTRACT

Savings, investments and economic growth are interrelated and interdependent. A number of economic models and large number of studies have attempted to explain and establish these interrelationships and interdependencies with divergent results. The direction of causality also has been shown to be different by different models and studies. In India, the household sector contributes the most to the gross domestic savings though it has been declining in the last few years. The composition of household savings and investments are skewed towards physical assets and currency holding as well as deposits respectively. This study takes data on composition of the Indian household savings and investments for a period of eighteen years before the 2016 demonetization year, i.e., FY 1998-2015 to explore the interrelations among the various components of household saving and investments.

Keywords: Household sector, Household savings, Household investments, Trends in Household savings in India, Trends in Household investments in India, Financial years 1998-2015.

INTRODUCTION

Savings, investments and economic growth are interrelated and interdependent (Anwar and Sampath, 1999, Piotr, 2011, The World Bank, 2013). A number of economic models and large number of studies have attempted to explain and establish these interrelationships and interdependencies with divergent results. The direction of causality also has been shown to be different by different models and studies.

In India, the gross domestic saving, as a percentage of gross domestic product, has consistently increased post-Independence. Private savings have far exceeded the public savings, which in fact has declined from early 1980s.

Within private savings, the household savings has been contributing the maximum to the domestic savings (Roy Choudhury and Bagchi, 1990, encyclopedia.com 2000).

In India, the household sector contributes the most to the gross domestic savings though it has been declining in the last few years. The composition of household savings and investments are skewed towards physical assets and currency holding as well as deposits respectively. This study takes data on composition of the Indian household savings and investments for a period of eighteen years before the 2016 demonetization year, i.e., FY 1998-2015 to explore the interrelations among the various components of household saving and investments.

Typology: This section presents the definitions of the pertinent terms adopted by official bodies such as Government agencies like the central banks and the keepers of economics and other statistics.

Savings and Savings Rate: Savings is simply total income less total expenditure. Savings rate refers to the amount a person, household or an organization puts in the savings account or a similar avenue as a percentage of the total disposable income of that person, household or organization.

Gross Domestic Savings: Domestic savings have three components – Household sector savings, private corporate sector savings and public sector savings.

Household sector: European System of National and Regional Accounts (ESA 2010) defines Household sector as: "…consists of individuals or groups of individuals as consumers and as entrepreneurs producing market goods and non-financial and financial services (market producers) provided that the production of goods and services is not by separate entities treated as quasi corporations. It also includes individuals or groups of individuals as producers of goods and nonfinancial services for exclusively own final use." Ministry of Statistics and Programme Implementation MOSPI (2007), India, includes in the household sector all "individuals, all non-government, non-corporate enterprises like sole proprietorships and partnerships owned and/or controlled by individuals and non-profit institutions which furnish educational, health, cultural, recreational and other social and community services to households."

Household sector has been termed as the net financial surplus sector in the economy (Prakash et al March 2018). Among the three sectors mentioned above, household sector is the most heterogeneous sector. It includes not only resident household, but also non-profit private entities serving the households and quasi-corporate sector. However, when base year of national accounts was changed to 2011-12 from 2004-05, the definition of Household sector was also changed slightly. Now, all the quasi-corporates, who prepare their accounts in the same way as the private registered and listed corporates, have been placed under the private corporate sector category. Unregistered MSMEs (micro, small and medium enterprises) are also placed under the household sector (Suneja, 2018).

Household Sector Savings: It is the savings out of the disposable income of households. It has two components – saving in financial assets and saving in physical assets. Saving in financial assets is gross financial assets less financial liabilities. Gross financial assets include savings in various avenues such as currency (cash holdings), bank and non-bank deposits (e.g., NBFC deposits), different types of provident funds, pension funds, life insurance, stocks, debentures, mutual funds, claims on government (post office and small savings schemes), and net trade debt. Financial liabilities include loan and advances from bank and non-bank sources, housing finance companies, cooperative non-credit societies, and government sources. Physical assets include house, real estate, gold and silver.

Household Investment Rate: It is defined as gross investment divided by gross disposable income of the household sector in national accounts. Purchase of consumer durables including passenger cars, are not part of household investment.Contribution of the public sector to the gross investments used to be highest till the economic

liberalizations and privatizations gained momentum. Though household savings are the highest among the three sectors, household investments have remained in-between the other two. Out of the three sectors, the private sector is considered the most efficient investor in the economy.

Net claims on government: Ministry of Statistics and Programme Implementation, MOSPI (2007) defines this component as: "…investment in government securities, small savings, bearer bonds, capital investment bonds, national rural development bonds, national deposit scheme, compulsory deposits and other such schemes brought out by the Government from time to time, less household's net borrowing from the Government."

Trade Debt: Ministry of Statistics and Program Implementation, MOSPI (2007), defines the trade debt (net) as "the change in trade due in respect of sundry creditors minus change in loans and advances to sundry debtors.

Importance of Household Savings for a Country's Economy: Household financial savings are the most important source of investment for any economy. Out of the three sectors, the household savings historically has the largest share in gross domestic savings (Krishnamurty and Saibaba 1981). Traditionally, this sector also has been a financial surplus sector. In an ideal economic situation, household is the net lender to the economy, with public sector a net minor borrower and private sector a major net borrower.

Recent Trends in Household Savings in India: Till the FY 2012, India's aggregate savings rate was comparable to the emerging economies in Asia like Thailand and Indonesia. It was even much higher than that in the developed economies like the USA and the UK. However, from the year 2011-12, 2016-17 and beyond, the household savings rate has been on steeply downward trend - 23.64 per cent of GDP in 2011-12 to 16.26 per cent in 2016-17 (Rangarajan, 2018). Savings in both physical assets as well as financial assets are part of this decline. Post-demonetization, the savings pattern has swung from physical assets to financial assets, with bank deposits continue to corner the lions share (but declining - from 56% in FY12 to 41% in FY16) and mutual funds gaining currency (ICICI Securities 2016). Interestingly, 2018 RBI data shows that the cash holdings are at the highest level since 2011, proving the apprehension that people have reverted to their old having of saving in cash (Business Today 2018).

REVIEW OF LITERATURE

The relationship between savings, investment and growth have been examined by different economic models like the neo-classical growth models of Ramsey (1928), Solow (1956), Swan (1956) Cass (1965), and Koopmans (1965), and the AK models of Harrod (1939), Domar (1946), Frankel (1962) and Romer (1986).

There have been divergent views on what drives economic growth among the economists, policy makers and researchers– savings, investments or consumption. For example, Lewsi (1955) has propounded that an increase in savings accelerates economic growth. Solow (1956) model has argued that there is a virtuous cycle between income, saving and investments – income raises saving, which in turn raises investments. The early Harrod-Domar models, on the other hand have advocated the prime role of investments for the economic growth **(**Jangili 2011)**.** Jappelli and Pagano (1994) have argued that higher saving leads to higher investment which in turn leads to higher GDP growth, but in the short-run. While all these models have assumed that savings is the cause and investments and economic growth as the effects, Carroll and Weil (1994) have hypothesized to the contrary that it is economic growth which is the cause of savings and not the other way round.

As far as consumption is concerned, it may be financed by savings or higher disposable income. On the current debates on the economic growth in India, some analysts have advocated consumption-led growth rather than domestic investment-driven growth, particularly, investments by the private sector (Gupta 2016).

Researchers in the Indian context have found support for the above divergent views on the interrelationships or interdependencies among savings, investments and economic growth (Sinha, 1996, Mühleisen, 1997, Sinha and Sinha, 2008, Verma, 2007, Verma, 2009, Samantaraya and Patra 2014). Singh (2010) in his study on the long-run effects of domestic saving on income found bidirectional causality between saving and growth. Jangili (2011), testing for Granger causality between saving, nominal investment and nominal GDP in India at aggregate and sectoral levels, found evidence of the direction of causality from saving and investment, both individually as well as collectively, to economic growth, but not the other way round. However, his study found the reciprocal causality between saving and investment in case of the household sector.

Out of the different savings options, Indian households have found to prefer physical assets like land, buildings, gold, machinery and livestock which are not as liquid as the financial savings (Patrick 2015). Among the financial savings, bank deposits have taken precedence over the other forms of savings like life insurance, shares and debentures, etc. As household savings has the largest share (almost 70%) in the gross domestic savings in India, there is a need to study the trends in it and its components and their interrelationship/ interdependencies with household investments. This article examines these trends and interrelationships between household savings, and its components, and household investments and its major components for the period between FY 1998 and FY 2015. The period covers eighteen financial years before the 2016 demonetization in India.

OBJECTIVES OF THE STUDY

The study analyzes the interrelationships/Interdependencies among the components of Total Household Savings, i.e., Gross Financial Savings, Physical Savings and Financial Liabilities. It also analyses the interrelationships/Interdependencies among the components of Total Household Investments. The same between the components of Total Household Savings and Total Household Investments has also been analyzed. The study period spans over eighteen years before the year of recent demonetization in India, i.e., FY 2016.

METHODOLOGY

Data for analysis were obtained for this exploratory study from a report by Motilal Oswal Securities Ltd (Gupta, 2016) which in turn had used data from Central Statistical Organization, Reserve Bank of India and its own reports. The data pertains to Total Household Savings as a percentage of GDP and Total Household Investments as a percentage of Gross Financial Savings from FY 1998 to FY 2015. Further granularity of both the major indicators were obtained from the same report in the form of Gross Financial Savings, Physical Savings and Financial Liability for Total Household Savings, and Currency, Deposits, (explanation of currency and deposits) Life Insurance, PF & Pension, Shares & Debentures, Claims on Government and Others (Units of UTI and trade debt (net)) for Total Household Investments.

The correlations between these indicators were studied based on the r values and p values obtained from the correlation matrix (Table 2 and Table 3) using MATLAB. r value provides not only the dependency, but also the direction of dependency, such as a value close to zero indicates no dependence. Value close to +1 or -1 indicates dependence. A +ve value shows an increase in values when the same of any of the other indicators also increases. A – ve value indicates the opposite trend. In case of p value, it is less than 0.05, it is usually considered as statistically significant. Thus this study used the r and p values to present the trends in the effect of the household savings and investment related indicators on one another.

RESULTS AND DISCUSSION

A glance at Table 1 reveals that in certain years, financial savings had exceeded the traditional physical savings. The years were 1998, 1999, 2006, and 2008. From 2011 to the end of the study period, people had significantly preferred

the physical savings routs. However, the savings in financial assets as a percentage of GDP had steadily increased till 2008, the year in which the market had crashed significantly. Currency holdings had been steady except for the period 2005-2008 when it had come down to single digit percentage point. Deposits had constituted the major share of financial savings and had steadily increased from 2006. Share of life insurance in the gross financial savings had steadily increased without any exception in any FY. On the contrary, Provident Fund and Pensions share had steadily come down from 2002 to 2014 and had gone up marginally the next FY. Share of savings in market instruments had also come down steadily over the years with a small spike in 2008. Claims on governments had upward trend between 2000 to 2006 after which it had declined significantly year after year. The last column had also steadily declined. The data is consistent with the opinion that India had been largely a cash economy. Households largely put safety of savings ahead of returns.

Claims on government (government securities, small savings, bearer bonds, etc) has significant contribution to gross household savings. Physical savings positively correlated with life insurance. Same relationships have been found between Currency and Others, PF & Pension and Shares & Debentures, PF & Pension and claims on government, and finally, PF & Pension and Others. Weak but significant relationship is found between Gross financial savings and Shares & Debentures. Negative significant correlations are there between Physical savings and PF & Pension, Physical savings and Shares & Debentures, Physical savings and Others, Financial liabilities and Currency, Financial liabilities and Others, Deposits and Shares & Debentures, Life Insurance and claims on government, and Life Insurance and Others.

CONCLUSION

An analysis of the of the composition of the Household Gross Financial Savings and Household Investments during the period FY 1998 – FY 2015 in India shows results consistent with earlier studies and reports by the central bank and other analysts. In the pre-demonetization years, India had been largely a cash economy and continues to remain so. Physical assets (mainly house and real estate) and deposits rule the roost on the savings and investment charts. Currency holding had been steady in both pre and post-demonetization years. Share of Life insurance in the total household investments had gone up with physical savings. PF & Pension and Shares & Debentures have moved together. A few years down the line, a comparative study of the compositions of household savings and investments in the pre and post-demonetization years would help the Banking, Financial Services and Insurance sector to strategize their marketing strategies to sway the Indian public more towards investments in market-related products.

ABSTRACT

Dyadic communication is a deep interpersonal communication between two dyads. The two dyads interact with each other very frequently for a common purpose. There are communications between various dyads such as husband-wife, father-son, father-daughter, teacher-student, and supervisor-supervisee. At present, farmers are facing a number of stresses as they work in isolation and have to put in long hours with little time for rest and recreation. This leads to depression. Generally, farmers' families are dependent on the family household heads for their sustenance. If proper relationships exist between the various dyads in the family, in times of uncertainty a wife, son or daughter can be of immense help to a farmer in surmounting the various difficulties and stresses faced during farming.

INTRODUCTION

Communication is the process of exchange of ideas, feelings, thoughts, and messages with others [1]. Dyadic communication is of central importance to interpersonal relationships. Dyads exit in families, work groups, neighbours, or students in a class. A large group breaks down into a series of dyads. Dyads are formed for achieving a mutually desired benefit or goal. Two people may form a group in an organization for improving the work morale. Husband and wife, a dyadic group, if faced with marital difficulties may form a coalition with one their children. Due to the relationship, a dyadic consciousness emerges and they see that they work as a pair, a team, or a couple [2]. A dyadic communication is an interpersonal communication and it is a transaction that takes place between two

individuals [3]. As the elements in the communication process determine the quality of communication, a problem in any of the statements can reduce communication effectiveness [4]. Selection of the particular medium for transmitting the message can be critical, because there are many choices. Information must be encoded into a message that can be understood as intended by the sender. There are many choices for transmitting the messages. Due to differences in language, education, and culture, semantic barriers come into play. Semantic barriers come from differences in language, education, and culture. Obviously, there is a problem if the sender is speaking in a language the receiver does not understand.

Objectives

(1) To study the dyadic communication pattern between farm family head and daughter for taking farming decisions
(2) To find out the distance maintained while communicating in different dyadic situations among the dyad, farm family head and daughter.

MATERIALS AND METHODS

In Ganjam district in Odisha the blocks Digapahandi and Chikiti were purposively selected for the study. Two villages Gadagovindapur and B-Nuapada were randomly selected under these two blocks. From each village fifty farmers were taken from the two blocks. For the study Purposive as well as simple random techniques were adopted. While selecting districts and blocks purposive sampling technique was adopted. Simple random sampling technique was adopted for selection of villages and respondents. The total number of farm respondents was one hundred under the study. Dyadic communications among the farm family members with respect to the farming activities were the dependent variable of the study.

ANALYSIS

Table 1 represents the communication between the family heads and their daughters. The variable education of the respondent, family education status, and family size were significantly associated with the dyadic communication with daughters with respect to farming operations. The education of the respondent and the family education status were negatively and significantly associated with the dyadic communication between father and daughter. The possible explanation is that due to the differences of education status, the mental distance between the elements of the dyad increased to a considerable extent. Effectiveness of communication in the dyad regarding farming activities was hampered due to the difference in educational status. Family education status of the respondent had also negatively significant association with the dyadic communication between a family head and his daughter. Due to the increased educational level of both individuals the information endowment regarding farming operations would be more which ultimately influences to create an antagonistic effect instead of a synergistic effect and chances of conflict may arise regarding farming operations.

Family size showed a positive and significant relationship with dyadic communication between family heads and their daughters. With the increase in number of family members, the dyadic communication between the family heads and their daughters increased. The cumulative effect of interaction between the family heads and their daughters increased the dyadic communication status of the families. It was clear that cumulative interaction offered higher communication efficiency than individual interaction. Table 2 shows that in case of the dyad family head-daughter the multiple regression analysis showed that the variable family size was positively and significantly effective in delineating the variable dyadic communication and the contribution of the variable family size is 57.40% in delineating the dyadic communication between family heads and daughters.

CONCLUSION

Social grouping is very important for human beings. The social group has a role in maintaining the relationship among the members. Various dyads exist in society. Proper dyadic communication should exist for taking firm decisions on cultivation practices and maintaining behavioral health. This can help the farmer to manage the farm in a better way and in times of distress, he can be saved.

ABSTRACT

Organogenesis has provided useful systems for understanding the regulatory mechanisms of plant development.After the identification of chemical determinants in plant growth and development, several studies have been carried out on molecular mechanisms responsible for organogenesis over the years.Understanding the regulation of root development is of great importance in the field of agriculture.It is a crucial determinant for plant anchorage, the efficiency of water and nutrient uptake, and establishment of plant- microbial communities.Higher plants exhibit an amazing diversity of root architecture at a morphological level. Recent genetic studies have identified several genes responsible for root initiation in cereals (Coudert*et al*., 2010). A conserved core gene regulatory network regulates root initiation.Chen *et al*. (2012) have examined the effect of Nitric Oxide and Auxin on the induction of lateral root formation in rice (*Oryza sativa* L.), by recording the HemeOxygenase (HO) activity and the lateral root number. Heme Oxygenase gene (*OsHO)* activation has a positive effect on the lateral root system. It was concluded that Nitric oxide and Auxin increase HO activity at the molecular level and in turn increase the lateral root number in rice.

Keywords: mechanisms, *Oryza sativa,* network, activity, molecular.

INTRODUCTION

Cereal crops are the essential food crop, feeding more than half of the world's population. The increasing population and economic development have been posing a growing pressure in food production. To meet the demand for food for the increasing population, raising the yield ceiling of cereals remains a priority task for breeders. As an essential organ of the rice plant, root performs vital functions: acquisition of resources and anchorage of the plant. A plant's

roots system determines both the capacity of a sessile organism to acquire nutrients and water, as well as to provide a means to monitor the soil for a range of environmental conditions. These enable a plant to shape the root architecture by its needs and the physical constraints imposed by its environment n develop a well-adapted root system. Due to the importance of roots to ensure crop yield under suboptimal water-availability or low soil fertility. The plant's root system is a critical target trait to improve crop performance. It, therefore, is relevant to acquire further insights into root formation, root architecture and the controlling physiological and genetic factor Organogenesis is a significant path of regeneration that involves differentiation of cells or tissue into organs such as shoots and roots. Organogenesis is derived from the Greek words "Organo" & "Genesis".

Factors affecting organogenesis

Intrinsic factor

Genetic control: The presence or absence of auxin transcriptionally regulates many genes involved in general root growth and development.

Hormonal control: Endogenous auxin accumulates in the root tip where it coordinates cell divisions, cell expansion and contributes to the gravitropic response of the root

Extrinsic factor

- Environmental factor
- Gravity
- Light
- Water availability
- Nutrient gradient

Roots and its characteristics: "Roots are axial multicellular structures of sporophytes of vascular plants which usually occurs underground, have strictly apical elongation growth, and generally have gravitropic responses which range from positive gravitropism to diagravitropism, combined with negative phototropism" Raven and Edwards (2001).

Different parts of roots:

Characteristics of root

i. Descending part
ii. Negatively phototrophic
iii. Non-green
iv. Root cap /root pockets
v. Unicellular root hair
vi. No nodes
vii. Lateral roots

Incase of monocot plant root, there is no secondary growth, and vascular bundle is scattered. Incase of dicot plant root, secondary growth is present, which make an annual ring and also vascular bundle compactly packed.

Root organogenesis: The root system 's fundamental function is to mediate contact between plant and soil, and to provide water and nutrients to the plant. The root system 's architecture is determined by endogenous mechanisms which integrate constantly.Environmental signals, such as nutrient availability and moisture or salinity, and thus modulation of the primary root growth and branching. The developmental Root flexibility systems which are extremely important for the efficient use of soil and the survival of plants under less favorable conditions are largely determined by their post-embryonic branching ability. Lateral roots originate from selected pericycle cells which

acquire the attributes of founding cells and subsequently undergo a series of anticlinal divisions. The architecture of the root system largely depends on the development of individual root initiation events controlled by spatiotemporal regulation.

Importance of genetic improvement of root

Increasing productivity: The grain filling in rice is found to increase with the increase in the root activity improved at a genetic level. (Yang *et al.,*2011).Success in "super" rice breeding has been considered significant progress in rice production in China. This study aimed to test the hypothesis that an improved root system may contribute to better shoot growth and consequently to higher grain yield in "super" rice.

Enhancing tolerance to abiotic stresses: Improvement of plant roots at the genetic level help develop new varieties of crops. which can survive drought, and produce higher yields under water-scarce farming systems. (Gowda*et al.,*2011) . Genetically improving the root system help plants tackle abiotic stresses like high soil salinity. The plants developed to have root systems which have low affinity for toxic K+ ions or have a low Na+ to K+ ratio. Due to high NaCl quantity in soil, the plant roots protect the plant against the toxic effects of Na+ ions and maintains the efflux of Na+ with the influx of K+ ions into the roots. (Horie*et al*2011).

Improving the efficiency of nutrients: Developing cultivars with genetically regulated root systems which can utilize soil nutrients effectively and not rely on fertilizer application alone. (Wada *et al*1990) .

Genetic control of root organogenesis by NO_3^-. : NO, and auxin act synergically to control diverse aspects of root biology and lateral root development. Nitrate is firmly auxin-dependent, a role of NO as a coordinator of nitrate and auxinsignalling to control the overall root response. The high rate of N supply to the root system as a whole usually is associated with a reduced allocation of resources to root growth (i.e., decreased root/shoot ratios). Similar contradictory effects of NO3 on root growth were observed. It was proposed that the NO3 supply modulates lateral root (LR) development in two distinct ways through a systemic inhibitory effect that results from the accumulation of NO3 (and/or its metabolites) in the shoot. Another through a localized stimulatory effect that depends on the local concentration of NO3 at the LR tip. An analogous ''feedback–feedforward'' model for NO3 regulation.

Genes responsible for root organogenesis: Genetic and molecular mechanisms controlling root development is critical for the development of new rice ideotypes. Those are better adapted to adverse conditions and for the production of sustainably achieved rice yield potential.

Genetic control on root organogenesis by Auxin.: Root development in cereals is controlled by many extrinsic (environmental) and intrinsic signals. Plant hormones represent critical regulators of plant developmental processes, including lateral root initiation, patterning, and the emergence of the lateral root. Besides the classical phytohormones, peptide hormones such as members of the CLE-Like/GOLVEN family small molecules such as nitrite oxide, or reactive oxygen species also have regulatory effects on different aspects of root development and branching.

PIN-FORMED (PIN) and AUX1 classes of auxin efflux and influx carriers are involved in lateral root formation in cereals. PIN auxin efflux carriers, such as ETHYLENEINSENSITIVE ROOT (EIR) and AUX1 influx carriers are expressed in specific areas of the root about lateral root formation, in riceand barley respectively. The maize homologue of AUX1is also highly expressed during brace root initiation.Mutations in the rice gene crown rootless4 (crl4) and Osgnom1 exhibit no crown roots and a reduced number of lateral roots . Also, the expression of OsPIN2, OsPIN5b, and OsPIN9 is altered inOsgnom1, indicating that polar auxin transport involving OsPINauxin carriers and regulated by CRL4/OsGNOM1is required for crown root and lateral root initiation in rice. AUXIN/INDOLE-3-

ACETIC ACID (Aux/IAA) proteins are critical regulators of the nuclear auxin response pathway and modulate lateral root formation. This proteins function as auxin co-receptors with TRANSPORTINHIBITOR RESPONSE 1 (TIR1) and closely related AUXIN SIGNALLING F-BOX (AFB) proteins. Aux/IAA proteins also function as transcriptional repressors by interacting with members of the AUXIN RESPONSEFACTORS (ARF) transcription In the presence of auxin. Aux/IAA proteins are degraded via ubiquitination by the E3 ligase Skp1–Cullin–F-box protein (SCF) TIR1/AFB complex, thereby derepressing ARF activity.Mutations in Aux/IAA proteins such as OsIAA13 in rice and ROOTLESS WITH UNDETECTABLE MERISTEMS1 (RUM1) in maize that block their auxin-mediated degradation confer lateral root defects. Mutant Osiaa13 contains a single amino acid substitution in the degron sequence required for the auxin-triggered turnover of the OsIAA13 protein Osiaa13 exhibits a lateral rootless phenotype. miRNAs OsMir393a and OsMir393b, negative regulators of the messenger RNAs OsTIR1 and OsAFB2, the rice orthologues of Arabidopsis auxin co-receptors TIR1 andAFB2also appear to be involved in lateral root initiation in rice. Overexpression of 35S::Mir393 causes a less number of crown roots and a strong auxin-resistant phenotype . In the crown root and at lateral root initiation sites The GUS reporter gene is present which is controlled by theOsMir393a promoter

GUS staining accumulates transiently in the pericycle cells during the early stages of lateral root formation. Suggesting thatOsMir393a may be involved in a regulatory feedback loop of auxinsignalling during lateral root initiation. Methyl jasmonate, nitric oxide, and auxin induce lateral root initiation in rice and it is hypothesized that this occurs via the induction of HEME OXYGENASE 1 (OsHO1) expression, through a calcium- and calmodulin-dependent signal transduction pathway OsHO1 can produce carbonmonoxide, a molecule known to promote lateral root initiation in different species. HO1 genes and carbon monoxide production may constitute a key relay in the promotion of lateral root initiation by different signals and hormones in monocots.

CONCLUSION

It is of prime importance to understand the root organogenesis at a molecular level. Identifying key root developmental genes can help identify those which explain a significant portion of natural root trait variation. It will be essential to the creation of new ideotypes that are better prepared against threats to the climate. Conversely, root QTL cloning would also disclose genes important to root production networks. This form of method can be carried out in the coming years, and results analysis will contribute to a more precise understanding of the molecular mechanisms of cereal root production.To design a root system for optimization to enhance and maximize crop performance, and has the potential to bring about the second green revolution.

ABSTRACT

Genome sequencing not only expanded our knowledge of many plant species' blueprints but also uncovered the complexities of coding and non-coding genes. It is important to understand the basic methodolgies, design and the detail of essential RNA-based advanced technologies like a miRNA, atasiRNA, MicroRNA sponge Target mimicry,STTM,and gRNA / Cas9 for their use in plant genetic functional studies and their potential for genetic improvement of crops we addressed in this review article. The study provides perspectives on how to improve genome technologies based on the RNA and their Practical implementations in unravelling the coding and non-coding genes and their network

INTRODUCTION

Genome sequencing fostered functional genomics. The whole-genome sequences of many plant species is now available, and next tasks will be the functional verification of a large number of genes to accelerate the study of plant biology and the improvement of crop genes.Functional characterization is mainly achieved by the creation of various gain- or loss-of-function mutants in plants. Traditional gain of gene function in plants is achieved through the expression of target genes driven by strong promoters such as cauliflower mosaic virus (CaMV) 35S and CaMV 35S enhancers. Loss of gene function is commonly induced by ethane methyl sulfonate (EMS) mutagenesis or by T-DNA/transposon insertion, which leads to mutated/truncated proteins with attenuated or null functions. All these technologies target genes in a random manner without any specificity.

More recent technologies are aimed at specific gene targeting to induce loss-of-function. Loss of function can be achieved by targeting either the DNA or RNA of a specific gene for alteration or silencing. To target a specific DNA (gene) in the genome, technologies such as zinc-finger nucleases (ZFNs), transcription activator-like effector

nucleases (TALENs), meganucleases. ZFNs, TALENs, and meganucleases require complicated protein engineering before altering genes of interest. Targeting the RNA of a given gene for silencing involves the use of RNA interference (RNAi), a great discovery in silencing genes post-transcriptionally. RNA-based technologies are an essential toolbox for functional genomics in plants. Small RNA-based gene silencing is widely used as a popular means to study gene function because it can lead to gene silencing at either the transcriptional or post-transcriptional levels (target RNA cleavage or translational repression).

Understanding different types of RNAs:

Based on RNAs involved in protein synthesis, they are categorized as::
Messenger RNA (mRNA): Convey the genetic information from DNA to the ribosome.Ribosomal **RNA (rRNA):** Essential for protein synthesis.

- Transfer RNA (tRNA): Helps to decode mRNA into protein.
- RNAs involved in post-transcriptional modification:
- Small nuclear RNA (snRNA): this RNA involved in splicing mechanism.
- Small nucleolar RNA (Sno RNA): Helps to chemical modification of other RNA.
- Guide RNA (gRNA): RNAs that guide the insertion or deletion of uridine residues.
- Ribonuclease P (RNase P): Ribonuclease P is a type of ribonuclease which cleaves RNA. Acts as a catalyst in the same way that a protein-based enzyme would.
- Regulatory RNAs:
- Micro RNA (miRNA): A small non-coding RNA molecule (containing about 22 nucleotides) found in plants, animals and some viruses, that functions in RNA silencing and post-transcriptional regulation of gene expression.
- Small interfering RNA (siRNA): A class of double-stranded RNA molecules, 20-25 base pairs in length. By degrading mRNA after transcription, it interferes with the expression of specific genes with supplementary nucleotide sequences.
- Piwi RNA (piRNA): The most abundant class of small non-coding RNA molecules expressed in animal cells. piRNAs form RNA-protein complexes through interactions with piwi proteins.
- Trans-acting Small Interfering RNA (tsiRNA): A class of small interfering RNA (siRNA) that represses gene expression through post-transcriptional gene silencing in land plants.

RNA based technologies

RNA-based technologies are an essential toolkit for plant genomics functionality. More recent technologies have the potential to target RNA of a specific gene for alteration or silencing. Based on the gene target, RNA based technologies are categorized as:

Primitive gene silencing approach: RNAi : Advanced RNA based technologies: amiRNA, atasiRNA, TM, STTM, MicroRNA sponges,gRNA / Cas9

Primitive gene silencing approach: RNAi:RNA interference (RNAi) is a biological process in which RNA molecules inhibit gene expression, typically by destroying specific mRNA molecules. RNAi/small RNA-based gene silencing is extremely useful and has become a powerful approach to functional genomics, especially when genetic mutants are unavailable or not feasible. Depending on nature and structure of intermediate precursor of RNA molecules, sRNAs can be broadly grouped into

- **siRNAs**
- **miRNAs**

siRNAs: Long dsRNA precursors generated from exogenous dsRNAs, transposons, and viruses sRNAs through the action of RDR2 (RNA dependent RNA polymerase 2). dsRNA is processed by DCLs (Dicer-like) into many siRNA duplexes, which is subsequently methylated by HEN1(Hua Enhancer 1) protein. Methylated mature siRNAs are finally recruited into RISC (RNA Induced Silencing Complex) and guide degradation of target mRNAs.

miRNAs: Primary miRNA (pri-RNA), produced from MIR genes by RNA Pol II, is diced into pre-miRNA by DCL1. DCL1 and other accessory proteins further process Pre-miRNA into 21–24 nucleotide duplex miRNA. Duplex miRNA is methylated by HEN1 into mature miRNA duplex and transported to the cytoplasm through HASTY transporter. Guide strand of mature miRNA gets associated with RISC consist of AGO1 (Argounate), which has a catalytic domain and guide RISC to target mRNAs leading to either target cleavage or translation repression. However, Primitive gene silencing approach has several limitations such as in a dsRNA construct each IR (Inverted Repeat) that founds dsRNA needs to be 300-800 bp long for effective RNAi or gene silencingsiRNA species and a much high probability of causing "off-target" effect (silencing of the unintended gene) or transitive silencing (spreading the silencing to regions outside the inducer sequence).The degrees of silencing of target genes via dsRNA are difficult to regulate.For overcome those problems, several specific technologies for functional genomics of small RNAs have been developed.

Advanced RNA based technologies: RNA-based technologies, along with their development and practical genomic applications of plant coding and non-coding genes,emphasizes on artificial microRNAs (miRNAs), Artificial/synthetic trans-active siRNA (atasiRNA/ syn-tasiRNA),Target mimicry(TM),short tandem target mimics (STTMs),miRNA sponge (SP),and CRISPR/Cas9(Clustered regularly interspaced short palindromic repeats (CRISPR/ Cas9).

Artificial microRNA (amiRNA): Artificial microRNA (amiRNA): A customized 21-mer small RNA artificially made from an endogenous precursor miRNA (pre-miRNA), which is generated by the endogenous miRNA pathway.This concept was validated in a study and commercialized to develop the virus-resistant transgenic Arabidopsis plants.

Mechanism: Designed amiRNA is inserted into endogenous miRNA precursor by replacing miRNA/miRNA* sequence with respective amiRNA-amiRNA* nucleotides. This pre-amiRNA is processed by a series of DCL1 slicing events to generate mature amiRNA/amiRNA* duplex. One strand of amiRNA gets incorporated into RISC and guides RISC to inhibit target mRNA expression either by mRNA translation inhibition or degradation of mRNA.

Artificial/synthetic trans-active siRNA (atasiRNA/ syn-tasiRNA): Artificial/synthetic trans-acting siRNAs(atasiRNAs/syn-tasiRNAs) can also be used as an alternative to induce specific gene silencing in plants.Specially designed 21-mer small RNA artificially made from the tasiRNA pathway using modifiedendogenous transactivesiRNA (tasiRNA) precursor, such as TAS1 and TAS3. The atasiRNA / syn-tasiRNA are designed and generated to target the silencing of any gene or gene family of interest.Specially designed 21-mer small RNA artificially made from the tasiRNA pathway using modified endogenous transactivesiRNA (tasiRNA) precursor, such as TAS1 and TAS3. The atasiRNA / syn-tasiRNA are designed and generated to target the silencing of any gene or gene family of interest.

Mechanism: Pri-tasiRNA transcript is first transcribed from genomic TAS locus, cleaved by miRNA through AGO1, double-stranded through theSGS3 and RDR6 cooperative operation, diced to 21-nt siRNA, and HEN1 methylated. The 21-nt siRNA then directs the target transcript to sequence-specific degradation. AtasiRNA enables simultaneous silencing of several different target mRNAs

Target mimicry(TM): a phenomenon in which a non-coding RNA, with a non-cleavablemiRNA binding site, imitates and competes with the RNA to bind to amiRNA which, Also, it gives miRNA goal defence by sequestrating the miRNA away from goal. This phenomenon first was ascertained in Arabidopsis where the non-coding gene INDUCED BY PHOSPHATE STARVATION1 (IPS1) binds from its target, PHO2, a putative ubiquitin-conjugating enzyme E2 24, to and sequesters miR399

Short tandem target mimic (STTM): Based on the TM approach, a modified technique has recently been developed, STTM technology, which targets specific endogenous small RNAs for degradation in plants, and which is useful in knocking down the expression of miRNAs of an entire family. An artificial RNA structure has two miRNA binding sites that are linked by an RNA spacer of 48– 88 nt. STTMs can bind to target miRNAs without being cleaved by them. STTMs inactivate miRNA activity by degrading or sequestering miRNA away from its target gene transcripts.

STRUCTURE OF TTM

miRNA sponge (SP): The adapted SP technology for plants contains many more (up to 15) copies of miRNA binding sites that contain mismatches at the cleavage site to make them effective in knocking down the expression of target miRNAs. The higher complementarily of SPs than TMs to their target miRNAs may also result in a better binding and silencing efficiency in blocking miRNAs. SPs use many miRNA binding sites linked by a short (4 nt) untested spacer

Mechanism: Designed a miRNA is inserted into endogenous miRNA precursor by replacing miRNA/miRNA* sequence with respective amiRNA-amiRNA* nucleotides. This pre-amiRNA is processed by a series of DCL1 slicing events to generate mature amiRNA/amiRNA* duplex. One strand of amiRNA gets incorporated into RISC and guides RISC to inhibit target mRNA expression either by mRNA translation inhibition or degradation of mRNA.

Artificial/synthetic trans-active siRNA (atasiRNA/ syn-tasiRNA): Artificial/synthetic trans-acting siRN As (atasiRNAs/syn-tasiRNAs) can also be used as an alternative to induce specific gene silencing in plants. Specially designed 21-mer small RNA artificially made from the tasiRNA pathway using modified endogenous transactives iRNA (tasiRNA) precursor, such as TAS1 and TAS3. The atasiRNA / syn-tasiRNA are designed and generated to target the silencing of any gene or gene family of interest.Specially designed 21-mer small RNA artificially made from the tasiRNA pathway using modified endogenous transactivesiRNA (tasiRNA) precursor, such as TAS1 and TAS3. The atasiRNA / syn-tasiRNA are designed and generated to target the silencing of any gene or gene family of interest.

Mechanism: Pri-tasiRNA transcript is first transcribed from genomic TAS locus, cleaved by miRNA through AGO1, double-stranded through theSGS3 and RDR6 cooperative operation, diced to 21-nt siRNA, and HEN1 methylated. The 21-nt siRNA then directs the target transcript to sequence-specific degradation. AtasiRNA enables simultaneous silencing of several different target mRNAs

Target mimicry(TM): a phenomenon in which a non-coding RNA, with a non-cleavablemiRNA binding site, imitates and competes with the RNA to bind to amiRNA which, Also, it gives miRNA goal defence by sequestrating the miRNA away from goal. This phenomenon first was ascertained in Arabidopsis where the non-coding gene INDUCED BY PHOSPHATE STARVATION1 (IPS1) binds from its target, PHO2, a putative ubiquitin-conjugating enzyme E2 24, to and sequesters miR399

Short tandem target mimic (STTM): Based on the TM approach, a modified technique has recently been developed, STTM technology, which targets specific endogenous small RNAs for degradation in plants, and which is useful in knocking down the expression of miRNAs of an entire family. An artificial RNA structure has two miRNA binding sites that are linked by an RNA spacer of 48– 88 nt. STTMs can bind to target miRNAs without being cleaved by them. STTMs inactivate miRNA activity by degrading or sequestering miRNA away from its target gene transcripts.

STRUCTURE OF TTM

miRNA sponge (SP): The adapted SP technology for plants contains many more (up to 15) copies of miRNA binding sites that contain mismatches at the cleavage site to make them effective in knocking down the expression of target miRNAs. The higher complementarily of SPs than TMs to their target miRNAs may also result in a better binding and silencing efficiency in blocking miRNAs. SPs use many miRNA binding sites linked by a short (4 nt) untested spacer

Mechanism: Generation of miRNA sponges depend on whether one, two or more miRNAs need to be targeted simultaneously with a single sponge construct. For this oligonucleotide, the approach can be used. For the oligonucleotide duplex approach, oligonucleotides are designed with two identical MBS (miRNA antisense binding sites). Each MBS is the antisense sequence of miRNA with a central mismatch at position 9-12 of the miRNA sequence (Bulge). This bulge is created by deletion of one nucleotide and changing the remaining three-nucleotide. A short 4-6 nucleotide sequence separates the two MBS.

Clustered regularly interspaced short palindromic repeats (CRISPR/ Cas9): Cas9 has now been modified to function for wide-ranging applications in eukaryotic cells including genome editing for gene mutation and modification transactivatingcrRNA (tracrRNA) for function in bacteria. Cas9 has now been modified to function in eukaryotic cells for wide applications, including genome editing for gene mutation and modification. Cas9 can also be controlled by transcriptional activation and suppression to control gene expression.

A diverse set of CRISPR-associated (cas) genes encode the proteins needed for the acquisition of new spacer sequences (Stage 1), CRISPR RNA biogenesis (Stage 2), and target interference (Stage 3). Each CRISPR locus consists of a series of direct repeats separated by single spacer sequences acquired from invading genetic elements (protospacers). A short motif flanks Protospacers Called the adjacent protospacer motif (PAM, * *) which is located in international DNA on the 5th (type I) or 3rd (type II) side. Long CRISPR transcripts are processed through distinct mechanisms into short crRNAs. A CRISPR-specific endoribonuclease in type I and III systems cleaves upstream eight nucleotides of each spacer sequence. In type III systems, an unknown mechanism trims the repeat sequence on the crRNA 's 3 range end. A trans-acting antisense RNA (tracrRNA) with complementarity to the CRISPR RNA repeat sequence forms an RNA duplex recognized and cleaved by cellular RNase III in Type II systems. This intermediate cleavage is further processed at the 5th end resulting in an approximately 40-nucleotide.This intermediate cleavage is also processed at the 5-point end resulting in an approximately 40-nucleotide crRNA mature with an approximately 20-nucleotide 3-point—the mature crRNA associates with one or more Cas proteins in each system to form a surveillance complex. Type I systems encode a Cas3 nuclease, which may be recruited to the surveillance complex for target binding. Some Type I systems have identified short high-affinity binding sites called the seed sequence, and genetic experiments suggest that Type II systems have a seed sequence at the 3 ends of thecRNA spacer sequence.

Comparison of Short Tandem Target Mimic (STTM) Technology with Target Mimic (TM) and Sponge (SP)Technologies: Endogenous IPS1 (INDUCED BY PHOSPHATE STARVATION 1) backbone-based TM technology showing the bulge (NNN), wobble (:), and mismatch (X) between miRNA and the miRNA binding site on the non-coding IPS1 RNA. (B) The improved STTM technology based on TM, showing a stronger interaction between the two miRNAs and the two miRNA binding motifs that are linked by a 48–88 nt spacer. The complementary regions show only bulges (NNN) with no wobbles/mismatches (C) The SP technology shows many copies (4–15) of miRNA binding sites with central mismatches (XX), which are linked by many (3–14) 4 nt spacers between 4–15 miRNA binding motifs.

Distinctions between CRISPR RNA-guided silencing systems and RNAi: Foreign DNA is integrated into the CRISPR locus in CRISPR systems, and long transcripts from these loci are processed by a family nuclease CRISPR-associated (Cas) or RNase III. The short CRISPR-derived RNAs (crRNAs) assemble with Cas proteins into large

surveillance complexes that target the destruction of invading genetic material.Long double-stranded RNAs are recognized as foreign in some eukaryotes, and a specialized RNase III family endoribonuclease (Dicer) splits these RNAs into short-interfering RNAs (siRNAs) that direct the immune system to invade RNA. PIWI-interacting RNAs (piRNAs) are transcribed from repetitive genome clusters often contain copies of retrotransposons and act primarily by restricting Transposonmobility.piRNA biogenesis has yet to be fully understood. MicroRNAs (miRNAs) are also expressed on the chromosome, and primary miRNA transcripts form stable hairpin structures tare processed sequentially (shown in red triangles) by two endoribonucleases (Drosha and Dicer) of the RNase III family.miRNAs do not participate in genome defence but are significant regulators of endogenous gene expression.

Like crRNAs, eukaryotic piRNAs, siRNAs and miRNAs associate with proteins that facilitate complementary interactions with invading nucleic acid targets. In eukaryotes, the Argonaute proteins pre-order the 5′ region of the guide RNA into a helical configuration, reducing the entropy penalty of interactions with target RNAs. This high-affinity binding site, called the 'seed' sequence, is essential for target sequence interactions. Recent studies indicate that the CRISPR system may use a similar seed-binding mechanism for enhancing target sequence interactions. **Application:** Those technologies have been exploited for the improvement of agronomic performance and nutritional value in various

Plant growth and development: The implication of those technologies in identifying the genes and transcription factors regulating growth and development processes of plants has flourished in recent past.Those approach has been successfully employed in understanding the molecular mechanism of flowering and associated genes, for instance, FT (Flowering Locus T) of *Arabidopsis.* In addition to determining the precise role of the flowering regulators, those have helped in developing specific knockdown lines of many growth unrelated genes, albeit they are significantly contributed to the growth and development of plants. Identification of involvement of heat shock proteins (HSPs) in growth and development. HSPs are known to play a crucial role in protein folding and response to various stresses in plants. Their requirement in chloroplast development was identified through amiRNA mediated silencing of *cpHsc70-1* and *cpHsc70-2*.] Male sterility is often considered as a useful agronomic trait for reducing self crossing. Complete male sterility of pollen was reported by targeting anther-specific TBP-associated factor genes (*SmTAF10* and *SmTAF13*) in *Solanum melongena* using those technologies.

Crop improvement : To feed continuous increasing global human population, the development of new crop varieties with increased engineering has been successfully proven its worth productivity is highly needed. More importantly, application of those technologies mediated gene silencing has also been exemplified in several reports, even in modifying the favourable agronomic traits of crop plants through manipulation of gene expression considering crop plants, the silencing of endogenous genes like phytoenedesaturase (*pds*), spotted leaf 11 (*Spl11*), and elongated uppermost internode (*Eui1*) was achieved through amiRNA technology in rice. The reduction in *Eui1* expression is thought to be one of the beneficial aspects of improving rice grain quality. In an attempt to increase the grain quality and economic value of rice, starch branching IIb (*SBEIIb*) gene was targeted through those technologies. Rice transgenic lines were expressing amiRNA against *SBEIIb*produced a more extreme starch phenotype which consists of an increased proportion of long amylopectin intermediate chains that is a demanding quality of rice grains. Similarly, betaine-aldehyde dehydrogenase (*BADH2*) in rice inhibited 2-acetyl-1-pyrroline (*2AP*) which is the principal compound responsible for grain fragrance. Interestingly, rice genotype having an aroma in grains was developed from non-fragrant variety by reducing expression of *BADH2* using amiRNA.The development of wheat streak mosaic virus (WSMV) resistant transgenic lines of wheat is another remarkable success story of amiRNA approach. WSMV is a persistent threat to wheat production and causes significant loss of crop every year. Fahim et al. (2012) have used a unique strategy, in which a polycistronic five arms of miR395 precursors, known as FanGuard (FGmi395) were utilized to target five distinct regions of the virus genome, and consequently, transgenic plants became immune to WSMV.A report described that suppression of genes involved in fatty acid biosyntheses, such as fatty acid desaturase 2 (*FAD2*), fatty acid elongase (*FAE1*) and fatty acyl-ACP thioesteraseB (*FATB*), led to the elevated seed oil compositionin *Arabidopsis*).

Elucidation of gene function in metabolic pathway: One of the most notable applications of amiRNA is to elucidate the function of any candidate gene in a short time as compared to conventional methods. Those approaches have successfully been applied for modulating flavonoid biosynthesis through degrading *NtFLS*(flavonol synthase), a key structural gene of the flavonoid biosynthetic pathway, and confirmed the role of flavonols in providing insect resistance. Transgenic tobacco plants expressing both *AtMYB12* and *amiFLS*miRNA transgenes displayed deep red flower colour and reduced rutin content in contrast to the white flower of *AtMYB12* expressing transgenic plants. This study provided evidence related to the insecticidal property of flavonols, especially rutin.

Biotic stress tolerance: Environmental stresses such as heat, cold, drought, salinity, redox stress and pathogen attack adversely affect plant growth and crop yield. Amongst common biotic stresses, different virus borne diseases are considered as major threats to crop production. They are responsible for the huge loss of economically important crops every year around the world. Studies indicate that endogenous miRNAs-mediated gene silencing is one of the mechanisms which potentially contribute to prevent virus invasion in plants. Those technologies have been successfully implemented to develop transgenic *Arabidopsis,*turnip, tomato, tobacco lines resistant to plant virus. Besides targeting viruses, deregulating the endogenous defence-related genes of the host can be another way for developing disease resistance in plants. Rhg1 was identified for soybean cyst nematode resistance in soybean. Conversion of dominant allele XAL3 into recessive xal3 allele through tissue-specific resulted in dominant traits bacterial resistant in transgenic rice.

Abiotic stress tolerance: Abiotic stresses like heat, cold, and drought comprise the significant challenges for plant growth. These stresses affect the growth, development and productivity of plants. Role of heat shock factor 1 (*HSF1*), a key regulator of thermotolerance in *Chlamydomonas*, was demonstrated using amiRNA. It is reminiscent from several studies that C-repeat binding factor (CBF) proteins play very crucial roles in cold tolerance of plants, and regulation of *CBFs* are believed to be under the tight control of MYB14 transcription factor. This interaction has been revealed by knocking down *AtMYB14* expression, which caused higher *CBF* expression and eventually increased the freeze tolerance. Silencing of another nuclear cap-binding protein, CBP80 in a potato (*Solanumtuberosum*) cultivar throughamiRNA resulted in improved drought tolerance in transgenic lines.

CONCLUSION

RNA-based approaches such as amiRNA, atasiRNA, Target mimicry, STTM, and gRNA / Cas9 hold enormous potential to study gene functions by knocking down, knocking in, or upregulating gene expression.This RNA – protein-interacting components can be improved by engineering a greater protein/enzyme partner, not only by altering the RNA partners but also by utilizing their biogenesis pathway components. These new tools strengthen the evaluation, and the use of substantial genomic information coming from post-genome studies in several species of plants performs a remarkable role in the assessment of plant biology and crop genetic advancements. Together by the use of constitutive, inducible, or tissue-specific promoters, these dynamic applications will analyze any desired genes or gene networks for their functions. Future developments must focus on efficiency, accuracy, simplicity, and reliability for the application of these technologies.

ABSTRACT

Language is boundless and immeasurable. To apprehend a language to its core and to stumble upon the facts associated to it, are the bigger challenges that a language study involves. Commonly it is said that language comes from a place. But practically, language comes from the people who are a part of the place. A language stays in a region, dignified, when its people maintain its ethnicity in all ways. Odia, the language of the land of Odia's or the state Odisha, holds an extensive history coinciding the culture, politics, media and literature. Despite the fact that Odia language is widely accepted at various levels, there lies a certain inhibition in the modern day studies as to what is the position of the language at any recognised level. All the apprehensions were answered when Odia language bagged the Classical Language status in 2014 alongside five other classical languages of India. Language not only resides in the form of textbooks but also in forms of dance, music, sculptures and archaeological entities. While the language studies have surveyed Odia upon various levels, it is equally important to study the language from a closer prospect. This paper tries to encapsulate the history of the language, its rise, the current status of the language and the possible efforts that every linguist or language aspirant needs to think about to promote all aspects of the language.

Keywords: Odia, classical language, history of Odisha, language maintenance

A Brief Social History

The period of globalization demands a change in every culture and there isn't any exception from the respect of this process. Culture is one important element of the society because it adds social, physical, psychological and rational identities to the people living in it. The amalgamation of culture with globalization underlines many meaningful effects of changes that a society has been through. Talking of Odisha and its cultural elements, Odia is a language

from the history. It comes from the Eastern Indo-Aryan language group and primarily spoken in Odisha. Over 33 million people speak Odia. It is derived from Sanskrit and different languages comparable to Odia including Bangla, Assamese, Maithili, Magahi, and Bhojpuri. Indian states such as Jharkhand, West Bengal, Andhra Pradesh, and Gujarat also include a tremendous amount of Odia speakers. Specifically in the town of Surat, Gujarat there is a widespread Odia community due to immigration works in the diamond polishing and fabric industries. Although Odia is the mother language of Odisha, Telugu, Bengali, and Hindi are also spoken in this state. Internationally Odia is spoken in the United States by a diverse number of speakers and there are several organizations run by people that uphold the culture and language overseas. These societies help in maintaining the culture and spreading it with time. Reportedly, Odia societies are located in Maryland, New York, Illinois, Virginia, Michigan, New Jersey and currently spreading around the world to Singapore, Canada, and Kuwait.

Statistically Odisha is said to be a neglected state of India. People of Odisha, through the time, have survived with limited funds and inadequate support of healthcare, research, etc. Such factors have caused limitations in communication in addition to loss of necessary language studies and services. Due to this, research is few in number which makes it difficult to assess the language history and its development. Despite all odds, Odia becomes the first language from the Indo-Aryan linguistic group, the Sixth Classical Language of India. Also, Odisha became the first State under the British to be linguistically organized.In a span of ten years, i.e. from 2004 to 2014, a total of six languages were titled as Classical Languages. India being a plethora of languages that have ancient & historical originality, demands high attention. In cue with this, Odia received a positive response for being included in the classical language list in February 2014 for it has its own independent tradition and literature. It is reported that the earliest inscription in Odia was seen in 1051 AD. The language has many popular variations like Sambalpuri, Baleswari, Berhampuri, etc.

The Rise of the Language

Digitalisation of Odia: The Odia documentations exist from more than 5000 years back which is now a major part of Odisha. It hails from the Kalinga kingdom and the pre-Kalinga civilisation. The cave paintings in Gudahandi & stone inscriptions of Hatigumpha in Udayagiri caves are important sets in the history. More than the caves, there were sets of writing found in the age. The *64 Sidhapada* i.e. the Buddhist poets, wrote spiritual verses in Pali (1) language. There were inscriptions notably on bronze plates which came to be known as *Tambapata* and the ones on palm leaves were known as *Talapatra(2).*

From left- ***Talapatra and Tambapata:*** Odia has travelled from the age old legacies to the times of internet where the details are being digitalised in order to circulate them worldwide. New age reading tools such as e-books and e-magazines were taking their stands in the process. While all other languages had already made strong presence on internet, it took Odia almost a decade to be feasible in order to reach every keyboard. The reliable fonts being used then were Akruti, Leap Office, Shreelipi, etc. The major setback of these fonts is that they consist of Latin characters which results in difficulty to read & reuse if sent to an external system. The documents become incompatible most of the times. To breach the error, Unicode was launched in 2000. This advanced version has both Latin and Odia characters and can be universally accessed.

Due to a common platform in input systems, the Odia daily's started growing periodically. At present there are around 100 newspapers being published in Odisha from all regions. The realization that news and archives are of more commercial value than literary writings, helped in the growth of paper industry. It benefited the language. People no more used pirated software for the fonts. Soon Odia started domineering in the academics world where different categories of books were published. This invited writers, poets and publishers to work more towards the language. The advent of Odia content websites began with Odia Wikipedia (or.wikipedia.org), the largest Odia online encyclopedia with over 8,000 articles. Useful odia books for the community like classic literature, inscriptions, scriptures, lexicons, journals & research papers were periodically posted and updated in this community website. The page has both volunteers and contributors who can edit content or contribute to the page as well as maintain

authenticity levels. *Srujanika*, a Bhubaneswar based organization along with *National Institute of Technology*, Rourkela and *Pragati Utkal Sangh*, Rourkela has scanned over 760 Odia books. Out of which over 200 books are hosted in "Open Access to Odia Books (OAOB)" and at oaob.nitrkl.ac.in. Organizations like *Manik-Smrutinyas* and *Institute of Odia Studies and Research* have re-licensed books of noted authors for free, commercial distribution. Majority of magazines, publishers and university or government organizations are requested and asked to grant free access so as to promote research & development with the help of these sources.

Research and Education: The state government sanctioned 25 acres of land specifically for setting up the Odia University at Satyabadi(2) (Sakhigopal) of Puri district. It is the second language university after Jagannath Sanskrit Vishvavidyalaya. The aims of the universities include facilitating research in language time to time and its promotion. But the fact remains, that there is a lack of educationalists and teachers for Odia language. Around 50 percent of teaching posts in Odia are lying vacant in all general colleges. The existing teachers however are struggling with their position to produce research work due to insufficient resources & opportunities. Currently Post Graduate degree in Odia is offered by reputed varsities like Utkal, Berhampur, Sambalpur, Gangadhar Meher, North Odisha, Rama Devi, Ravenshaw and Fakir Mohan University. The total number of sanctioned positions is 56 which include Professors, Associate Professors and Assistant Professors. The minimum requirement stands as: 1 Professor, 2 Associate Professors & 4 Assistant Professors. But on the whole, as many as 28 posts are still vacant for the same. At Fakir Mohan University the posts of Professor and Associate Professors have been lying vacant for a long time. At GangadharMeher University, the department runs with two Associate Professors. Utkal University, Ravenshaw University and Berhampur University still lack Professors which hampers the teaching & supervision to some extent. In addition to this, the Higher Education Department of Govt. of Odisha reports that 60 percent of Odia teaching posts are vacant in higher secondary schools, intermediate and degree colleges.

For a long period i.e. from 1998 to 2012 there were no scholars in Odia. Strong academicians who then passed the course had started retiring. The gap that got created still affects the fraternity. To put this logically, if someone completes post graduate degree now and gets awarded doctoral degree or qualifies the National Eligibility Test, they would be eligible to teach but it is quite a process in matters of time. Until then the posts aren't likely to get filled up too. With time, the students' outlook towards pursuing Odia language as a career is changing and meritorious students are now coming forward. Earlier if a student did not get any honours they'd opt for Odia, otherwise not. This will eventually change the employment scenario in the subject. In today's situation, the approach towards advanced studies is something that the subject needs. The concepts of translation, critical analysis & research, linguistics stand important for mining up the ancient Odia texts.

Political Movement or Cultural Awakening?

Odisha acquired its position as a state on the basis of the Odia language. But in general the government hadn't taken any active participation to promote the language due to lack of participation of its people. This is when the Odisha Bhasa Andolan was founded. The movement encompasses that Odia must be a household language for offices, business, courts of law, educational hubs, etc. the language of the state should be the language of the people as a whole. Nabakrushna Choudhury, the then Chief Minister of Odisha brought up the *Odisha Official Language Act* in 1954 to make sure that a process starts in order to globalize Odia. Odia not only should be an official language but a domestic language too. It should be common in households, among people and children, in a way such that there's no generation gap in regard to knowledge and origin of language. It is seen that Odia in western Odisha has Hindi predominance, southern Odisha has Telugu and northern Odisha has Bengali dominance. On the web, there is a fusion of Odia, English and Hindi. Odia as a language demands preservation, protection and propagation. In due with the 1954 language act, people around the state started building pressure on the government claiming that four crore Odias need to see their language alive. None other than the political parties could sack in pressure for this. *This was not a political movement against anyone but a cultural awakening!* Saving Odia became the concern of common man.
November 23rd was officially declared as the "Bhasa Divas" since it is the birthday of the father of the Language Act, Nabakrushna Choudhury. The consents and declarations from the government in the following period established

strong foundations in the minds of people. Modern schools and educational institutes started working on introducing Odia studies under the head Regional Language Studies. Central budgets were roped in and private sectors soon started accepting the implementation. The unintentional conspiracy of traditionalism vs. modernism that however started mentally among us weakened the roots of our mother language. Somehow, modernity of the world came to its rescue.

As a Medium of Instruction

India, the multilingual country functions with 1576 mother tongue languages(6), 22 official languages (7)and 13 different administrative languages. The National Curriculum Framework (NCF) – 2005 argue that the most suitable medium of instruction in any case is the mother tongue. The thoughts and expressions on either side can be effectively achieved. The education through mother tongue idea also promotes multilingual education since India is largely seen having cultural diversities. Cummins'(8) three language formula promotes multilingual communicative abilities in a country like India. This three language formula says that instructions in L_1 (first language) provides a sound base for the development of proficiency in L_2 (English) which means that the cognitive and conceptual skills can migrate from a native language to English. Thus focus was laid on the fact that children should be mastered with L_1 or the mother tongue first as it is a 'pre-existing knowledge base'.

Measures taken

The Right of Children to Free and Compulsory Education Act (RTE) of Article 21-A regulated in 2009 facilitates free and compulsory education to children within the age group of 6 to 14 years as a right. Every child has the right to free, qualitative, elementary and equitable education. The RTE Act became active in Odisha on 1st April 2010. In this light, he Government of Odisha undertook the responsibility to promote Odia language and culture, bifurcating the Tourism and Culture department in 2017. A dedicated wing was set up and named as the 'Heritage Cabinet' to manage and protect the monuments, ancient temples, scriptures and moreover the language. The cabinet demanded all shops and business places to build/rebuild their nameplates and signboards in Odia language. It was also prescribed that there would be punishment for non-abidance of such rules. On academic grounds, students are given ample opportunities. Students will be facilitated to pursue research in Odia as per UGC pattern, fees of meritorious students will therefore be waived off. State level programs or national level conferences, workshops& seminars are increasing from time to time.

The next important aspect includes the problems faced by tribal communities. There was an inherent issue with acquiring their mother tongue as the tribal children faced language gap. The Multilingual Education Program (MLE) of the Government in 2007 regulated a few points for accelerating language learning in the minority communities. Some of the important measures are noted below -

i. The mother-tongue (MT) of tribal children will be used as the medium of instruction for the five years of primary education in the MLE program in Odisha for sustained impact on tribal children's educational achievements, high levels of proficiency in Odia and English.
ii. English is to be introduced as a language subject in the MLE program from Class III. The tribal languages may be used as language subjects in post-primary levels starting from Class VI.
iii. Candidates with fluency in the mother-tongue of the children as well as competency in Second Language (L_2-Odia) and Third Language (L_3-English) will be given priority for recruitment as teachers in the local MLE Schools. Separate advertisement will be issued for MLE teachers specifying knowledge of the target mother-tongue as an eligibility condition.
iv. Candidates from the community with lesser qualifications but target proficiency will be engaged on contract basiswith a condition of acquiring the required qualifications within a reasonably stipulated time.
v. Children belonging to at least three mother-tongue skills will be identified to start a pilot program for development of teaching-learning plans for a purpose.
vi. MLE program will be implemented with an emphasis on sound pedagogic principles under the guidance of experienced pedagogy experts.

vii. The pedagogy in MLE program must seek to balance between the languages and diverse cultural practices in a manner that can effectively challenge the positioning of some dominant languages and cultures, building a strong sense of identity and pride in children's own language and culture.

viii. Team Leaders of all the language groups in the MLE program will go through an Orientation Workshop on Preparation of Textbooks and Teaching Learning Materials (TLM) with focus on basic aspects of MLE, curriculum, pedagogy, language issues, cultural content and other considerations in material preparation for linguistic minority children.

ix. Language-based teacher training institutes will be established preferably in the tribal districts of the State. The MLE program will be tied up with *the* English Language Training institute (ELTI) for providing training in Third Language (L3-English) to the MLE teachers.

x. Assessment of children's competence level in curricular and co-curricular areas and activities will be made in their mother-tongue following the mode of Continuous and Comprehensive Evaluation (CCE). Besides curricular progress, the personal-social characteristics of children such as attendance, participation, classroom interaction, peer interaction etc. will be qualitatively assessed.

xi. Cumulative school report/progress cards will be prepared in the local language and shared with parents. The assessment outcomes will be reviewed in regular duster-level meetings in order to develop remedial measures and evaluate the impact of remedial intervention.

xii. MLE program will strengthen its research and development activities at different levels of the program. While at the State-level research is necessary to assess the overall functioning and the impact of MLE schooling, at the cluster level the teachers will be suitably oriented to conduct action research to bring improvements and innovations into the system at the grassroots level.

CONCLUSIONS

With the higher secondary schools across the State yet to implement the Government order to use Odia language in all official works, the Directorate of Higher Secondary Education (DHSE) recently asked the schools to execute the provisions under Odisha Official Language (Amendment) Act immediately. According to the Act, Odia has to be used in all official communications by the Government offices. But various offices including junior colleges and other educational institutions are yet to implement the order. While there should have been communication in both English and Odia languages in official work, most of the Government letters are being issued in English. In order to ensure its proper implementation, the State Assembly had passed the Odisha Official Language (Amendment) Bill, 2018 with penal provisions. In May 2016, the State Government had brought an ordinance to enforce the Official Language Act, 1954 for all communications. Despite having provisions of punishment for non-compliance and rewards for officials, it failed to encourage them for maximum use of Odia language.

The Chief Minister of Odisha had to face a number of speculated objections when these rules regarding implementation of Odia were made rigid. Criticism was blunt upon him for his lack of command in the language. While the people on and off their duties practiced to regulate Odia, the ruler of the state was satirized by various media channels and opposition parties. Nevertheless, the effects of the official act grew stringer with time. It also influenced the Tripura government to mandate the use of *Kokborok* language on all signboards, nameplates and notice boards. Similarly, the Telangana government announced *Telugu* to be put up on signboards and in 2015 *Kannada* was regulated in Karnataka for the same. Following this, there was a Cabinet Meeting held which was conducted in Odia. There were also incentives for employees and departments for the use of Odia. The improvements and reciprocations have been happening for more than a decade and has transformed to an invariably bigger picture.

ABSTRACT

The Fe based ceramic NdFeAsO was prepared by solid state reaction method. Tetragonal crystal has been confirmed at room temperature through X-ray diffraction technique. The complex impedance plots reveals presence of both bulk and grain boundary effects, and non-Debye type of relaxation process occur in the sample. The material shows the negative temperature coefficient of resistance (NTCR) behavior. The dc conductivity data of the sample obeyed Arrhenius equation. The activation energy of the sample was found to be in the range 0.46-0.88 eV.

Keywords: X-ray diffraction, Ceramic materials, Impedance study, Activation energy

INTRODUCTION

The iron (Fe) based ceramic NdFeAsO is one of family of layerd high temperature superconductor with transition temperature 50 K. The discoveries of iron-based superconductors (FeSCs) have been greatly emphasized by the researchers due to simultaneous existence of their superconductivity and magnetic properties, having a layered structure [1-8]. The Fe based $RFeAsO_{1-x}F_x$ of rare earth family having R=*Sm*, *Ce*, *Nd*, *Pr*, *Gd*, *Tb* and *Dy* compounds come under FeSCs having highest superconductivity transition temperature (T_c~54 K). In these compounds, superconductive properties may be manifested due to FeAs and R (O/F) layer in which former layer behave as superconductive planes and later layer serve as charge reservoirs [9-11]. Among these, the compound $NdFeAsO_{1-x}F_x$ materials have a layered tetragonal crystal with crystallographic axes $a = b = 3.962$ Aº and $c = 8.555$ Aº [12-15]. Realising the importance of layered FeSCs particularly its superconducting nature at some high temperature we have synthesized Fe based polycrystalline ceramic NdFeAsO and studied their structural and impedance properties at high temperature in order to have complete the systematic prospective.

Experimental

The ceramic material NdFeAsO was prepared by solid state reaction techniques from the pure oxides: Nd_2O_3, Fe_2O_3, As_2O_3 with high purity in a suitable proportion. The stoichiometrically weighed compound for a particular composition was blend in air atmosphere for 2 h and then in methanol for 2 h by using an agate mortar and pestle to get homogeneous mixture of the materials. The mixed powders were calcined at 1100°C for 5 hrs. The quality and formation of the calcined compound were checked through an X-ray diffraction (XRD) method at room temperature using CuK_α radiation (λ=1.54 Å). The calcined powder were mixed with polyvinyl alcohol (PVA) which was used as binder o reduce brittleness of the pellets and then pressed into cylindrical pellets using hydraulic press. The pellet was then sintered 1150°C for 6 h. The binder PVA burns off during this process of sintering. In order to have both faces flat and parallel, the sintered pellet was then polished with fine emery paper. The flat polished surfaces of the pellet were then coated with air drying conducting silver paste. The pellet was dried at 150°C for 2 hrs to remove moisture (if any) before taking any electrical measurements.

RESULTS AND DISCUSSION

Structural analysis

Fig.1 shows the room temperature XRD pattern of NdFeAsO. The XRD data of the prepared sample suggested the tetragonal crystal system and most of the peaks are well matched with the previous report **[16]**. There is a good agreement between observed and calculated inter planar spacing d is seen. The lattice constants of the selected tetragonal structure are refined using a standard computer program package "POWD" **[17]** and found to be a=3.9763 Å, c=8.6469 Å, c/a=2.174.

Complex Impedance Study

Complex impedance spectroscopy technique has been recognized as a unique, non-destructive powerful technique to characterize the transport properties of solids **[18].** Generally, the contribution of bulk, grain boundary and electrode effect in the materials can be evaluated by separating the real and imaginary components of the complex impedance parameters. These parameters may be calculated from the basic formalism as: $Z^*(\omega) = Z' - jZ''$, where $Z' = |Z|\cos\theta$ and $Z'' = |Z|\sin\theta$ and complex electric modulus as: $M^*(\omega) = M' + jM''$, $M' = \omega C_0 Z''$, $M'' = \omega C_0 Z'$, where ω is the angular frequency ($2\pi f$), $C_0 = \varepsilon_0 S / d$ is the geometric capacitance, ε_0 is the permittivity of the free space, S is the area and, d is the thickness of the sample.

Fig.2 shows the variation of real part (Z') and imaginary part (Z'') of impedance at different temperatures (100-200°C) in wide frequency range for the sample. A single semicircular arc is observed up to temperature < 125°C and two semicircular arcs are observed at moderate temperature >125°C. This shows that at low temperature (≤125°C), the electrical process of the sample is determined by bulk properties, whereas at high temperature the total electrical response of the composites is due to the contribution of both bulk and grain boundary effect. This indicates that, at low temperature, the localized relaxation due to bound charges predominates, and at higher temperatures, the relaxation in the sample has components from both a long range and localized relaxation.

The Nyquist plots also show the depressed semicircles whose centre lies below the real axis and exhibit non-Debye type of relaxation phenomenon in the compound **[19].** Further, it is observed that the bulk resistance decreases with increase in temperature which shows the negative temperature coefficient of resistance (NTCR) behavior. Fig.3 and Fig.4 shows the variation of Z′ with frequency at different temperature (100-450°C) for NdFeAsO. It is seen that the value of Z' decreases with increase in temperature and confirms the NTCR behavior as observed in Nquist plot. The Z' value decreases with increase in frequency for all studied temperature and merge at single frequency. The

merging of graphs at particular frequency may suggest the release of space charge. The merging of graphs takes place above 20 kHz.

Fig.5 and Fig. 6 shows the variation of imaginary part (Z″) with frequency at different temperatures (100-450°C) for NdFeAsO. From Fig. 5, It is observed that the magnitude of Z'' increases with increase in frequency and attains a maximum value at a particular frequency and then decreases. This trend has been seen clearly in the higher temperature region 125-200°C. The peak of Z'', indicates the presence of relaxation process in the materials. The peak value of Z'' shift towards higher frequency side with rise in temperature confirms the presence of temperature dependent relaxation process in the material. This may possibly the presence of small polaron at low temperature and defects at high temperature responsible for broadening. The merge of all Z'' curves at higher frequencies (irrespective of temperature) indicates the absence of space charge polarization [20-21]. From Fig.6, it is observed that in the high temperature region the merging of Z'' is also observed for low frequency region. The merging of Z'' exist upto the frequency 50 kHz and after that its value increases with increase in frequency irrespective of temperatures.

Activation Energy

The activation energy can be calculated using the Arrhenius relation [22] $\tau = \tau_0 \exp\left(-E_a / K_B T\right)$, where the symbols have their usual meanings. Here the relaxation time τ can be found out using relation $\tau = 1/2\pi f_{\max}$ where $f_{\max}$ is the maximum relaxation frequency corresponding to $Z''_{\max}$. The variation of τ with inverse of selected temperatures for the sample shown in figure 7. The values of activation energy calculated from the slope of the curves is found to be 0.88 eV. Also the activation energy can be calculated from variation of dc conductivity with inverse temperature. The dc electrical conductivity is evaluated from the impedance data using the relation, $\sigma_{dc} = d/SR_b$ where *d* and *S* are thickness and area of sample respectively, R_b is the bulk resistance. Fig.2 shows the variation of dc conductivity with inverse of temperatures (375°-475°C). It is found that the dc conductivity increases with rise in temperature for all the samples. The nature of the plot found to obey the Arrhenius relation $\sigma_{dc} = \sigma_0 \exp\left(-E_a / K_B T\right)$. The value of activation energy calculated from the slope of the plot and found to be 0.86 eV. These two values of activation energies are close to each other.

CONCLUSIONS

The iron (Fe) based sample NdFeAsO was prepared by a solid state reaction technique. The tetragonal structure at room temperature was confirmed through structural analysis. Impedance studies reveal the significant contribution of grain (bulk) and grain boundary effect. The bulk resistance of the material decreases with rise in temperature and exhibits NTCR behavior. The variation of relaxation time and dc conductivity of the material as a function of temperature exhibits Arrhenius type of behavior. The activation energy lies in the range 0.86-0.88eV.

ABSTRACT

RFID otherwise known as Radio Frequency Identification is a quite fascinating technology available at our disposal for quite a time. It has been implemented for several applications in the near past. Applications like garment industry, item tracking in malls, production line tracking etc. its popular because of its low cost long life and reliability. It enables identification from a distance, and unlike earlier bar-code technology, it does so without requiring a line of sight. RFID tags have a unique ID than bar codes.Security is an essential parameter today, everyone and every thing is analysed on the measure of security first then its used or utilised. So many researchers have targeted RFID as source of security provider. When security is the question no industry, no home and no person is an excecption. Various control systems have been designed over the years to prevent unauthorized access. This article is focused on the application of RFID to the security of an automated slide door. As each RFID tag or card is associated with an unique identification code it is quite justified to use it as a security measure to access into a room. The slide mechanism is automated usind a high torque DC geared motor and chain arrangement. Access into the room is limited to specific person with RFID cards. Another level of security is implemented is the password protection system to initiate the security module upon system reset or power failure. This module enables us to enter the password through a 4x4 keypad. If the password is not entered correctly then the RFID cards cant have access. Since two way security is implemented its quite rubost and secured for implementing in a house or small office.

Keywords: Arduino Uno, RFID, Door Lock, keypad, LCD

INTRODUCTION

Security and safety become vital everywhere now. So a security system is a requirement for individuals and an organization for safety into the residents and property. For this reason, the multi-way access control system is proposed. This system can be implemented in offices and home premises. This system allows only the authorized users i.e. the users who enter the correct passcode or show the valid RFID tag, to enter the homes or office. Door security is used in many commercial, governments, and residential buildings. This type of security is known as smart locks where it limits the only person, who knowsan electronic password. There are different types of door locks based on security levels. There are also various types of door locks available in the marks in the various shapes, sizes, and designs.

LITERATURE REVIEW

Many of rhe related research papers are refered prior to designing this project so as to make this model a fill-in some gap in the reseach and validate the concept of the work. Few researchers have worked on the digital code locking system as a security measure in automobiles [1]. Even some have worked on the use of DTMF through GSM module and hardware arrangements as a security measure to door locking and un-locking system [2]. A model comprising of a GSM mobile, IR sensor, LPG sensor and Fire sensor is proposed that has a keypad interface to enter the password and access the room [3].

The use of RFID tags and strips doesnot end in appliance tracking, garment tracking and home security, it has also been used biological body tracking i.e tracking of birds and animals to record the feeding rates, incubation behaviour, pair formation, homing behaviour, prospecting behaviour by non-breeding birds etc. [4]. A model comprising of RFID, GSM, Keyboard and LCD connected to a microcontroller is used as a security module for giving access to authentic person only [5]. A hostel security system is proposed to ensure that, only registered hostel in-mates have access to the services provided. This system captures the card holder image and compares it with the registered databse if a match is found then access is granted else an alarm is raised [6]. A magnetic door locking system is proposed which can be accessed by RFID recognisation system.

They have used Arduino interfaced with the modules and connected to the PC to store relevant information as the system also records the access information in the computer [7]. A system comprising of Barcode scanner and RFID reader is used to create a match. If a match is found the student is allowed to leave else the student is detained [8]. Another simple system is encountered that uses an RFID tag to authenticate access to an entry point which closes after a specified time interval [9]. A security system implemented on a door with RFID tag reader and an interfaced SDcard is proposed where on authorised entry the controller saves the information in the SDcard and allows access through the door and parallelly the card holder information is displayed in the LCD connected [10].

Proposed Methodology

The controlling unit of this work is Arduino Mega. The other components are interfaced to this microcontroller. The door automatically opens when either the correct passcode is entered using the Keypad or valid RFID tag is placed near to the RFID reader. And the closing of the door is controlled through another passcode. The LCDs “Door Opened” and “Door Closed” when the door opens and closes respectively. In case of incorrect passcode or invalid RFID tag, the door remains closed and the LCDs “Wrong, try again”. The opening and closing of the door are controlled manually through the switches from inside the room. When the open switch is pressed, the door opens and when the close switch is pressed, the door closes. Two status LEDs are also used to show the validity of the user i.e. whether the user is authenticated or not to enter the room. In the case of correct passcode and valid RFID tag, the green LED glows, otherwise, the red LED glows.

As can be seen from the fig 1 from the flow chart, at first, the LCDs a message which welcomes the user and asks him to enter the passcode or show his RFID tag. Then the user uses any of the methods i.e. enters passcode using Keypad or uses a valid RFID tag to enter the room. In the case of the correct passcode or valid RFID tag, the door opens automatically. In the other case, the door remains closed, the user is asked to try again. Once the authorized user enters the room, he can close the door by pressing the close switch installed inside the room. Similarly, to come out of the room, he can press the open switch to open the door. The power source is connected to the microcontroller to give sufficient power supply for the smooth functioning of the project. The 4x4 Keypad and RFID are connected to give input to the microcontroller i.e. passcode is entered through Keypad and RFID tag is shown to the RFID reader. The LCD is connected to display each operation like "Enter Passcode or Show your Card", "Door Opened", "Door Closed" and "Wrong, try again".The status LEDs are used to show the status of the door i.e. whether the door is opened or not. In other words, it is used to show the validation of the user i.e. whether he is allowed or not to enter the room. In the case of correct passcode and valid RFID tag, the green LED glows, otherwise, the red LED glows. Relay is used to drive the DC Motor which in turn drives the door. Can also be closed from outside the room by entering another passcode through the keypad.

Arduino Mega

As we know that Arduino is a open sourse hadware and software. It has project and user community. Arduino boards uses different microprocessor and controllers. The board contains few no. of input, output pins , which is used to connect the pripheral devices.So here we have used Arduino mega because it has more no. of input output pins as compared to the other boards.

Frame

The frame shown in Fig 3 is made up of metallic bars with appropriate dimensions and is placed in a measured area. It has been made with the help of welding. The gears and motor are fitted on the frame with proper alignment. The chain is also properly aligned on the frame and connected to the door.

DC Box Gear Motor

The below shownin Fig 4 DC motor is used to open and close the sliding door of a classroom. When the DC motor moves in the clockwise direction it opens the door. Similarly, when the motor rotates in the anticlockwise direction it closes the sliding door. This motor is fitted with the above-shown frame. RFID comes with a Reader and Tag. They used RF technology to read and capture the pieces of information. Reader connected to the microcontroller when powers up, create an RF signalfor up to several feet. When Tags are brought nearer to the reader then it reads the unique ID.there are a variety of tags available in the market. They are active and passive. Passive RFID Tags are used for short-distance communication, usually 10 feet or less.The most commonly used RFID reader is the EM-18 reader module. This module has a built-in antenna that is used to power the RFID Cards and also extracts the information from the Card's microchip.

4*4 Keypad

This module is used to enter the password for the door security system. A keypad consists of set of swiches arranged in rows and columns. This type of keybard are known as Matirx Keypad.

Arduino IDE

It is the open sourse software which makes it easy to write, edit, compile, upload codes into the varities of Arduino boards. This is basically a integrated development environment which supports varities of Arduino based microprocessor. It has supported files for windows , Linux and Mac OS.

Simulation Results

The beneath figures show the constant usage of the RFID based Door mechanization and security System. This framework comprises of two different ways to computerize and make sure about the entryway. The two different

ways are 1) with the assistance of Keypad and 2)with the assistance of the RFID framework. At the point when the individual is going for the principal way utilizing 4*4 keypad, the individual who realizes the passkey can just have the approval to open the entryway. At the point when the individual is going for the second technique, then he/she should have an RFID tag without that he isn't permitted to open the entryway. The framework is structured so that in the event that the individual neglected to have the RFID tag, at that point he may straightforwardly enter the passkey utilizing the keypad and can go into the Room. In the board box, there is no choice to set or reset the secret key in light of the fact that to make sure about the room. So just those can alter the passkey who has a thought regarding the programming. The RFID labels are given to the concerned people who are utilizing that room, others are not permitted to go into the room without their earlier data. The continuous model structured is appeared in Fig 8. From the start, the client is approached to enter the password or show his/her card. At that point, the client utilizes any of the strategies for example enters a password utilizing Keypad or utilizations a substantial RFID tag.

Using the Keypad

Step1: When the correct passcode is entered using the keypad, it displays"Door Opened" on the LCD,and at the same time the Sliding door starts moving and the inturn opens the door.

Step2: When the passcode entered is incorrect, it displays "Wrong! Try Again" and the door remains closed

Step3: The door can also be closed by entering another password, which is set through the program.

Using RFID Technology

Step1: When a valid RFID tag is used, it displays "Door Opened", sliding door starts moving and opened the door, shown in fig 12(a).

Step 2: In the case of an invalid RFID tag, it displays "Wrong! Try Again" and the door fails to open whichshown in fig 12(b).

Using switch

The opening and closing of the door can also be controlled manually through the switches. Once the user has entered the room, he/she can come out of it by using the switches.shown in fig 13(a)(b).

Step1: When the Open switch is pressed, the door opens

Step2: When the Close switch is pressed, the door closes.

CONCLUSION

A secure door lock system or access control system has become necessary nowadays to prevent access to unauthorized users to the office and home premises for the security of our lives and properties. And RFID is increasingly used for security and access control applications. In this project too, we have successfully implemented an access control system using passive RFID. When the user puts the valid tag near the RFID reader, the door opens automatically, otherwise, the door remains closed. Alternatively, users can also enter the correct passcode using Keypad. Hence, this system provides more security as the entry of unauthorized users is restricted through two secure ways – Passcode or RFID tag.

This project can be further modified to an advanced level by adding the following features:

1. Resetting password
2. Retrieving the previous password

Which can be done by using a GSM Module and registered mobile number. When the administrator himself forgets the password he can reset the password wirelessly through a mobile phone.

ABSTRACT

The rapidly developing technology has influenced human life significantly. Employing this technology to make our life easier and safer is the focus of this article. We use LPG cylinders in our homes to cook. It's quite a hazardous item in our house. It is highly flammable when it comes in contact with naked fire, even it may explode if ignored at the initial stages of leakages. So to make it safe to use safety measures are to be taken. Not all follow the safety measures even in many cases it's observed that they are ignored. Even in some cases, it has been observed that the users don't even know about the safety breaches. At this point, this prototype model comes into play. This article proposes a system that has another facility of booking the additional gas cylinder by itself, the user doesn't need to worry about running out of gas. The system uses the load cell and LPG sensor (MQ-2) as the sensing elements, it employs the GSM and LCD modules to share the information and alerts with consumers as well as the respective safety service departments. The system with help from the sensors detects the leakages and takes emergency preventive measures and intimates the same to consumer and safety service departments. Using LPC2129 is ideal because of its rugged performance, fast response, and low power consumption. The system can be further upgraded to enable the IoT feature in future applications.

Keywords: LPC2129, LPG, MQ-2, Load Cell, GSM.

INTRODUCTION

Using LPG casually and carelessly may cause a fatal result. So safety is the priority of this article. Many accidents minor or major happen daily due to carelessness and ignorance. This proposed system would help consumers to continuously monitor and remind of the safety procedures. It also takes the responsibility of the consumer's comfort by booking a cylinder for well before it runs out of gas. The system has the following components connected to it to help the consumer safety as shown in figure 1. The sensors would feed the detected information to the processor and

it would perform some calculations, comparisons and then take necessary steps as suits and mentioned the internal program code.

LPC2129 is a modern processor of the ARM7 family. It is interfaced with components like:

1. Load Cell to monitor the available weight of the gas cylinder
2. LPG Sensor (MQ-2) to detect the PPM of gas found in the surrounding atmosphere
3. Buzzer to alert the consumer of any anomaly detection
4. LCD to display the anomaly and information
5. GSM module to communicate with the safety service Departments and the consumer when needed.
6. DC motor with a driver that is used to automate the operation of the gas regulator.
7. Relay module to operate the exhaust fan as needed.

Related work

Quite aseveral systems have been proposed in the near past to make the use of LPG safe and convenient. The systems used to detect the level of LPG in the closed area of the kitchen and takes necessary actions to alert the consumer [1]. If the content of LPG in the air is significant i.e. more than 1.8% or higher it becomes quite explosive. Few authors have proposed the use of NodeMCU to detect and intimate the consumer over the android platform [2]. Automatic detection of LPG is quite a process preferred by the researchers to help the prevention of accidents caused by LPG [3]. Booking of LPG gas has become quite a simple job due to the interactive IVRS system used by the suppliers [4]. But it is not that helpful for peoples in rural areas and old age people living away from their young ones. A detection system using Arduino UNO R3 and MQ-6 is also proposed to aid the similar purpose of this article [5, 6].

PROPOSED METHODOLOGY

Many discrete components installed and interfaced together make a system functional system. This system under consideration has the following components:

Load Cell: It works on the principle of Wheatstone bridge. These have a piezoelectric strip adhered to an aluminum block that supports the weight under consideration. This weight would introduce small stress which gets transferred to the piezo strip and the resistivity changes making the bridge unbalanced. Calculating the degree of imbalance, the weight is calculated shown in fig-2(a)

MQ-2: This is a sensor that has a chemically active material inside it. The concentration of LPG changes its electrical property which is then interpreted to equivalent data and communicated to the processor shown in fig-2(b).

Buzzer: It is a piezoelectric material that is capable of generating high-frequency acoustic sound when DC supply is applied.

LCD: It's a monochromatic display, capable of displaying 20 characters each in 2 rows.
GSM Module: It's a communication module capable of making communication equivalent to a mobile phone fig 2(c).

DC Motor: It's a motor that is used in an arrangement to control the regulator electrically through a controller.

Relay Module: This component makes it possible to control high voltage appliances through controller working on small voltages.

RESULT AND DISCUSSION

The system on start-up initializes the program and checks on the sensors. First, it checks the weight of the LPG left, if it's more than the minimum, then the system is programmed to execute the next segment as in fig 4(a). Else the system initiates the LPG booking procedure and sends an SMS with the consumer number and address to local authorized LPG distributor and the consumer as in figure 4(b) and 4(c).

Secondly, it checks the MQ-2 for LPG detection. If no leakage is detected then the system goes back to the normal operation shown in fig 5(a). But if any leakage is detected (Fig 5(b) then immediately the regulator is turned OFF through the DC motor arrangement and exhaust fan is turned ON as shown in fig 5(c) and 5(d). The message communicated to the consumer is shown in fig 5(e). If leakage persists after the preventive measures then a message bearing the information of the LPG consumer number and location is sent to the corresponding safety service departments as shown in fig 6(a) and 6(b).

CONCLUSION

This system proposed is a versatile system that is fast, rugged, and flexible to upgrade. The sensors used can be replaced by industrial or commercial sensors depending on the place of application. Since it is flexible to upgrade, IoT and ML,etc can be implemented to make the system autonomous, more interactive, and intelligent.

ABSTRACT

In this era of 21st century, there is a vast enhancement in the technological sphere, different tools and techniques are available for the betterment of the agricultural sector. To maximize the agricultural outcome and to reduce human interferences, there is a need to switch to new technology named the Internet of Things (IoT). IoT is a network of devices to transfer information without human intervention. Hence, to obtain high productivity, IOT works in association with agriculture to obtain smarter methods of farming. Coming to IoT, it deals with sensors and actuators, just like human beings have sense organs to sense some changing characteristics and react to them according to the instructions given by the brain. Similarly, IoT is all about sensing a changing characteristic through sensors (highly sensitive) and sending the obtained changing data to a processor.

The processor actuates the actuator (action) according to the requirements. This is how a system is designed (Embedded Systems). All the data that a system receives and sends are stored in a database (back-end) and accordingly is updated on the webpage (front-end) which is, later on, made accessible to the user through a website. These top technologies can add the next step to the traditional method of agriculture adding a better way of production. Sensors like soil moisture, DHT-22 (Temperature and Humidity), gas sensors are used for sensing different important parameters for crop growth (like water, sunlight, carbon dioxide, temperature, moisture). These data received by the sensor are sent to a processor (Raspberry pi 3 B) that is, the decision making unit to take the required action and hence, actuators like motor (water irrigation), solenoid valve (irrigation), UV LED's (light intensity), bubbler (moisture) start their actuation properties in accordance to the signal given by the processor.

Keywords: IoT, Embedded Systems, Automation, DHT-22, LDR, Soil Moisture sensor, Green House, Database, Webpage, Gas sensor, Raspberry pi 3 B.

INTRODUCTION

Traditional agriculture includes human intervention and the resources provided to the crop were as per human decision as the plants were not able to convey their needs. Today, in the rising era of technology things (Living/Non-living) are made intelligent enough to convey their needs and this is where the IoT (Internet of Things) comes into the picture. Every object has several unique identifiers, which makes them different from others. The technology uses this unique identifier as a base of communication. Specific UIDs have characteristics change when there is a change in the surrounding. Sensors are the objects that are highly sensitive to any change.

They are triggered with a small power but can actuate devices consuming more power, sensors can determine this change in UIDs, for example, the unique identifier of soil is the moisture content in the soil if the moisture content is less or more a signal will be sent to actuating devices(solenoid valve) to provide the soil with water now in between the sensors and the actuators lies a decision-making device which will process the signal provided by the sensor to it and accordingly the actuators have to react, parameters like temperature and humidity as its UIDs of the atmosphere and this rise or fall in temperature or temperature are detected by the sensor (DHT22) which can sense this fluctuation in the Environment and trigger the actuating devices(fan/bubbler) to maintain the atmospheric balance.UID of water is level of water which in turn can be perceived by sensors (float sensors) which after perception can cause a device to function(sump motor) alike the same concept UID of light is the intensity at it is sensed (LDR sensor) and the actuators provide the plant with light (UV led, red or blue LED), carbon dioxide concentration can also be monitored through gas sensors to monitor the carbon dioxide content in an area henceforth all the parameters that a plant requires can be monitored and controlled with sensing parameters and actuating devices thus a plant grows in a controlled environment with proper resource usage and management,Now to make the entire setup completely IOT enabled the entire operation that is perception and action has to be stored in a database and displayed in a webpage for safe storage of data for few future analysis, study and implementation.

IoT has four layers Application layer, Transport Layer, Network layer, link layer, and perception layer. The application layer is an abstraction layer that specifies the shared communications protocols and interface methods used by the hosts in a communication network, the Transport layer is a layer in the open system interconnection (OSI) model responsible for end-to-end communication over a network, it provides logical communication between application processes running on different hosts within a layered architecture, link-layer it is the lowest layer in the internet protocol Suite, the networking architecture of Internet the link layer is a group of methods and communications that only operates on a link that a host is physically connected to, the perception layer is the lowest layer of the conventional architecture of IoT, This layer's main responsibility is to collect useful information /data from things or Environment(such as WSN, heterogeneous devices, sensor type real-world objects, etc.).

The rest of the paper comprises of section II presents the Literature Survey, controlling the climatic conditions of the crop field is covered in section III, controlling the irrigation is covered in section IV, the system design along with the block diagram is explained in section V, the hardware and software components used are explained in section VI, we further described the IoT-Web integration in section VII, Section VIII covers the Implementation & Results, finally, the paper concludes in section IX with Future Works and its applications.

LITERATURE REVIEW

IoT is a growing field in technology over the past two decades and emerging to be the first preference when it comes to making anything intelligent like a complete human being is made of several systems (digestive, nervous). IoT is such a system where it can send and receive data through widespread network either with wired or wireless communication. Machine learning can only be implemented if at all there is a system that sends, receives, and stores data over a network so IoT is the foundation stone for new solid and emerging technologies like Machine learning [1]. IoT in agriculture is a benchmark and paves a path towards good productivity, high yield, proper resource

management, and more likely here crops speak, and accordingly, actions are taken [2][5]. Some of the top challenges that agricultural sector face is making the atmosphere suitable enough for plants, improper irrigation, proper nutrition to the plants, disease management, and all these problems can be solved only when the problems are detected by the crops growing in the field (it's just like a patient can describe his/her disease more appropriately to a doctor than anybody else) only then the problem is solved when it is detected that moreover saves resources [3][4]. IoT enabled systems has a strong grip on perception (sensors), actuation, storage (for further analysis) and linkage this overall package makes it more suitable for agricultural automation and preventing human intervention in agriculture thus the growing global population would reach 9.6 billion by 2050 and to provide food to this mass agriculture needs to embrace IoT [7].

PROPOSED METHODOLOGY

Overall this system shown in figure 2 is divided into four parts. i.e. Actuation, Controlling, Sensing, and Data Base Management. We have also designed the web page so that we can see the output shown in figure 5.

Controlling

We have used Raspberry Pi 3B for controlling. It is consisting of 40 pins, each pin has specific GPIO pin and different functionality.

Sensing

We have used different both analog and digital sensors. Analog sensors are soil moisture sensors and MQ2, as we cannot interface analog sensors with the raspberry pi directly so we have used MCP3008 which is an ADC. Soil Moisture Sensor used to sense the Moisture tension inside the soil whereas MQ2 helps to measure the CO2 level inside the glasshouse. Digital sensors are float level sensors and DHT22. Float level sensor used the know about the water level using the buoyance principle. DHT22 is used to measure the temperature and humidity inside the glasshouse. Sensors give the Data to the raspberry pi.

Actuators

Here we have used five Actuators used i.e. LED, sump, Bubbler, Fan, Solenoid valve. We have made the led using the combination of UV, Blue, and Red led to replacing the sunlight for the growth of the plant. Sump motor helps to lift the water from Bucket to overhead tank. When the humidity is a high fan will be on to control the humidity and temperature. Solenoid valve used to control the flow of water from the overhead tank to soil bed.

Database Management

This is used to take the data from the raspberry pi and store it in the database. Here we have used PHP and MySQL for creating the database and storing the data from the raspberry pi to the database. We have designed the web page using HTML and CSS and connected the database with the web page using PHP shown in figure 4.

We have designed the glasshouse having three soil beds, bubbler, and overhead tank. The soil bed is having 40% soil, 40% vermicompost, and 20% sand in it. Inside the overhead tank and bubble tank, we have fixed a four-level sensor to know about the status of the water level. Inside the bucket, we have a fixed sump motor. Water from the sump motor goes to an overhead tank if both the status of the float sensor is low. Then the water from the overhead tank goes to the Soil bed and Bubbler according to the status of the soil moisture sensor and the status of the float sensor present inside the bubbler.

Monitoring & Controlling Climatic Conduction of Green House

The parameters that are to be controlled for the crop are temperature, humidity, and the amount of carbon dioxide content in the atmosphere. The sensor that determines as well as perceives the humidity and temperature is DHT22 which has an NTC (negative temperature sensing Coefficient) and a thermistor (a variable resistor that changes its

resistance when temperature changes.). These variations in resistance are interpreted and recorded through a processer (Raspberry Pi) by a certain programming methodology.The processor is programmed as per to react which change in variation for example if the temperature exceeds 30 degree Celsius the fan has to be in ON state automatically until the temperature drops to certain level same goes for humidity sensing factor, in between two electrodes lies a substrate that changes the conductivity of the electrodes after humidity perception and thus a bubbler (provides additional humidity if required)reacts at one of these varying conductivity of the electrodes as per processing unit in concern to the programming logic that is implemented.The light intensity is handled by LDR (light dependent resistor).It is a component whose resistivity changes when light intensity increases or decreases adding to this variability the UV LEDs, red LED's and blue LEDs (lights required for crop growth) are set ON or OFF as per need.

Monitoring & controlling Crop Fields

The moisture property of the soil has to be maintained through the right stimuli and that is achieved by a soil moisture sensor. The moisture sensor uses capacitance property to measure the dielectric permittivity of an area. This sensor averages the water quantities in the soil. Now this changing property (Dielectric Permittivity) acts as a stimulus to the processor via programming methodologies. Accordingly, the irrigation system that is set up is available for the soil that is, the solenoid valves placed in the pipelines are opened in case the water content is less which signifies that both water content for the plant and soil needs to be maintained. This entire process is very vital for irrigation purposes as the actuation depends on the property of the soil to hold moisture. This is how the soil is directly speaking to the processor to make the water available for it and the processor is reacting to the stimulus received from the soil by opening the solenoid valve.

Availability of water: The entire irrigation process depends on the availability of water. To check the availability of water we need to consider a parameter that is, water level. To sense the level of water we use float sensors, which are setup inside the overhead tank or the water storage house, one at the top and one at the bottom. The float sensor acts as a switch. When the level of water rises and reaches the brim, the sensor reads high voltage and signals the processor which in turn is connected to the sensor to terminate the motor as the overhead tank is full. The float sensor at the bottom indicates that the overhead tank is empty as it reads low voltage and signals the processor to switch ON the motor, to, make the water available to the soil refer figure 3.

IoT Web Integration

Web integration with IoT enables people with all information they demand. IoT is a straightforward concept that has to be related to the web to be accessed, configured, and manipulated correctly with the associated sources (mobiles, smart devices, etc.). To establish this connectivity IoT is integrated with web design. Web designing is more complex as a designer has to think of front-end and back-end design. The webpage is created using HTML, CSS, and JavaScript in-order to represent the data at the front-end. Front-end is created to communicate with users through smart devices. At the back-end, the database has been created using the tool, phpMyAdmin, to fetch the data from the sensors via processor using PHP scripting language and accordingly update it through a certain interval. A reference table is present along with the current data table for comparing the data and accordingly, the actuation takes place. Actuation happens depending on the required conditions for a certain type of plant.

Hardware and Software Description

Hardware used

The Proposed System consists of hardware like a Raspberry Pi Model 3B, Float level Sensor, DHT22, Soil Moisture Sensor, Bubbler, MQ2, MCP3008(ADC), Solenoid Valve, relay Module, and SMPS 450 Watt.DHT22 sensor is known as the Temperature and Humidity sensor which is used to give the exact temperature and humidity value to the processor for further actuation. MCP3008 which acts as a 10-bit analog to digital converter. Generally, in a Raspberry pi, all the pins are digital pins, so to interface analog sensors to the raspberry pi we have used this IC which acts as a

converter, converting an analog value to digital. The gas sensor is used to sense the carbon dioxide content present inside the greenhouse. We are considering the analog output from the gas sensor and providing it to the MCP3008 to get the digital values. We have made the led setup using red, blue and UV led for proper growth of the plant. Float Level Sensor is used to know the level of water inside the tank using the buoyance principle.

Software used

The system is incorporated with the following software for the functioning of the whole system. There are Raspbian operating system which supports Python, phpMyAdmin Database, Apache Server, MySQL. Steps to install the Raspbian OS

1. Download NOOBS and extract it
2. Format the SD card
3. Put the Noobs Files on the SD cards
4. Put the SD card into the raspberry pi and
5. Power up the raspberry pi for booting of OS.
6. Upgrade and update the OS.

Steps to install the Apache Server

1. Use the command in the terminal sudo apt-get install apache2.
2. Check for Apache is working properly or not by using any web browser.

Steps to install PHP

1. Install suing command Sudo apt-get install libapache2-mod-php7.3 php7.3

Steps to install the phpMyAdmin,

1. Type command sudo apt-get install php php-mbstring
2. Use command sudo apt-get install phpmyadmin
3. Add "Include /etc/phpmyadmin/apache.conf" in path /etc/apache2/apache2.conf
4. Start the connection suing /etc/init.d/apache2 restart
5. Check phpmyadmin is working or not by open any browser and typing http://localhost//phpmyadmin
6. Give the user name and password

Steps to install the MySQL

1. Use of command on the terminal sudo apt-get install mariadb-server-10.0
2. sudo apt-get install php7.3-mysql
3. Verify MySQL is working properly or not

Step to install dht22 library

1. Enter the below command to download the library.
   git clone https://github.com/adafruit/Adafruit_Python_DHT.git
2. Then enter into the installed directory using the below command.
   cd Adafruit_Python_DHT
3. Now download the required modules using the below command.
   sudo apt-get install build-essential python-dev
4. Then install the library using the below command.
   sudo python setup.py install

Step to install spidev for Soil Moisture

1. Start by launching the terminal and typing in the below command:
   sudo raspi-config

2. Navigate to the interfacing options.
3. Enable the SPI interface.
4. Reboot your Raspberry Pi.
5. Now install spidev library.
6. sudo apt-get install git python-dev
7. git clone git://github.com/doceme/py-spidev
8. Go inside the directory cd py-spidev/
9. sudo python setup.py install
10. install numpy library
11. sudo apt-get install python-numpy

PhpMyAdmin is a free software tool written in PHP and can handle the admiration of MySQL over the internet. MySQL connector is the module present in the python for inserting the database into PhpMyAdmin internally. We have also used the HTML, CSS for designing the web page. PHP also used for connecting the python code with the web page and database with the web page.

Simulation Results

The proposed system is divided into four-part: 1) Sensing, 2) Actuation, 3)Controlling, 4)Data Base Management. Firstly, coming to the sensing parts, we have used both analog and digital sensor i.e. DHT22, Float level Sensor, Soil Moisture Sensor, MQ2. We have used Raspberry Pi for the controlling process. Sensors give the data to the controlling and according to it, actuators do its respective work. Actuators used are led, Solenoid valve, Bubbler, Fan, Sump Motor. Lastly, coming to the database management raspberry pi take the data from the sensor gives to the database and then the results are store in the database every second and then displayed on the web page shown in figure 4. We have used PHP, MySQL, HTML and CSS shown in figure 5. Refer figure 6 and 7 for more details.

Case1. First of all, we have used a sump motor inside the bucket so that we can lift water to the overhead tank and inside the bucket, we have fixed one float level so that whenever the water level goes down the pump motor will be off and the whole system will stop working.

Case2: We have designed over the header tank so the water from the sump will go to the overhead tank than from the overhead tank from will go to the soil through the drip irrigation method by the operation of the solenoid valve.

Case3: We have fixed the soil moisture sensor in all the soil beds so that if the soil tension inside the soil bed increases then the solenoid valve will be on.

Case4: Inside the overhead tank we have fixed two float level sensors so that if both the float level sensor gets high condition then the sump will be off and both get low condition then the sump will be on and the same in the bubbler.

Case5: Water from the overhead tank goes into bubbler and also inside bubbler we have fixed two float level sensors so that if both are low then the solenoid valve will open and water from the overhead tank will go into the bubbler.

Case6: We have fixed dht22 for measuring the temperature and humidity sensor so that if the humidity is low then bubbler will be on and if the temperature is high then the fan will be on.

Case7: We have used the combination of UV, blue, and red led in replacement of sunlight of the growth of the plant. Here we have set the time from 5.00 am to 6.00 pm the led will be on otherwise it will be off.

CONCLUSION

We know to feed this vast population there has to be a change in the way agriculture is carried out and this change is IOT implementation in agriculture. Human beings are efficient because they can sense, process, act themselves and don't need any intervention and the same has been done to crops inside a greenhouse the are provided with a controlled and protected environment where they can sense their needs via sensors, processor and actuator which makes them more efficient furthermore like a human if a machine could take its own decision (machine learning) that will be a revolution to agriculture. Agriculture should be availed with a wide range of scopes like disease

detection which is very vital because plant should be healthy to be fruitful which can be done through a pi camera and we can even monitor the plant's growth hence this entire process will be a system which can detect its disease and need and act accordingly which will be the next step to agriculture development with technology in hand.

ACKNOWLEDGMENT

I would like to acknowledge my friends involved who have accompanied me in completing the work and I would like to pay my sincere regards to my faculties, who have guided and mentored the entire process of the project has a great impact on agriculture and I pay my gratitude towards our University for rendering all support needed

ABSTRACT

The main purpose of this project is the identification and detection of "Drunk Driving". Nowadays, if observed it will be quite clear that drivers after getting drunk face accidents on road. So drunk and driving is a major reason for accidents in almost all countries all over the world. This article is concentrated on the designing of an alcohol detection system to be installed inside the car for the safety of the passangers and the driver himself. The accident prevention system is a flexible system that detects the alcoholic level of the driver and takes steps accordingly. The use of LPC2148 microprocessor to implement this project is selected due to its rugged and low power consumption, its quite reliable and stable during operation. The MQ-3 sensor is used to detect the percentage of alcohol in human breath when exhaled on to it. Alcohol sensors give out analog data that can be analyzed by the LPC2148 microcontroller. The data received from an alcohol sensor is converted into digital form with the help of a digital converter (analog to digital convertor), after that the data is stored in microcontroller and then compared to the threshold values. If the value is beyond its set limits, then with the help of the program controller takes appropriate action which controls the ignition system. Here we used relays to control the ignition system. In this project by controlling the ignition system, we can prevent the accident that occurs due to drink and drive.

Keywords: LPC2148, GSM Modem, GPS Module, Alcohol Sensor,DC Motor

INTRODUCTION

Drink and Drive is the cause of most accidents observed all over the world. An Alcohol Detection system istalled inside in the vehicle would be quite convenient to track the driver's condition continuously to ensure the safety of the passangers as well as the driver himself. This project is designed to be installed inside the car and maintain a

continuous monitoring system inside it, the system is also facilitated with communication system that conveys information to the base station or the concerned person regarding the current status inside the car related to Alcoholism. This system used a GSM and GPS module to to track the vhicle and parallely the processor takes necessary preventive measures to avoid accidents as much possible. This can also be utilised for vehicle tracking in case the vehicle is stolen.

The modern smart phones are loaded with various physiological sensors with advanced communication capabilities powered by high speed internet capabilities. So the sensors in the smart phone can be utilised to detect a number of parameters to monitor in the project. Using the Bluetooth and Wi-Fi communication system the sensors in the smart phone is utilised for the project. The project would clarify the basic idea behind the tracking algorithm developed in this research. For individual vehicle tracking the first step, acquisition image sequences, and predetermining the detection zones at each lane. Second, we have conducted background subtraction.

Drinking and driving is already a serious public health problem. Its is a severely affecting the public as the number of accidents is increasing significantly due to the consumption of alcohol. This article presents the use of alcohol detector,a device that senses a change in the alcoholic gas content of the surrounding air this device is more commonly referred to as breath analysis, as it analysis the alcohol content from a person's breath. The system detects the presence of alcohol in the vehicle and slowly takes controlof the vehicle as well as establishing a continuous communication with the base station.

LITERATURE SURVEY

The background study for a project is necessary. This enables the tracking progress of the project effectively. In a system it is proposed that by analysing the the video and images of the driver it can be determind that how much attention the driver is having on the road. It uses the analysis of facial orientation, appearance of eyes, position of eyes etc. Another proposed system deals with implementation of AI that analyses the drowsiness and fatigue of the driver. The moment the system finds any anomaly it takes over. Using image analysis the contour of mouth while yawing is also detected to estimate the drowsiness of the driver. System with AI and Neural network based algorithms are used to analysis the drowsiness through video analysis. It warns the driver and lets information passed on to the next level.

PROPOSED METHODOLOGY

The whole system is divided into three parts, they are 1) Input device, 2) Output devices, 3)Controlling Unit. The devices which are input to the system are Alcohol sensor , GPS, GSM. Wheras the output devices are the mobile phones, the LCD display. The main controlling unit here is the LPC2148 ARM 7 Processor based controller. All the input and output device are interfaced to the main processing unit by wired and wireless medium. The input devices are acting as a sensors , which sens the physical parameter in analog form and send it to the controlling unit. As we know that in Embedded System, controlling devices like microprocessor and microcontroller can only understand the digital signals. So wen the input devices send any analog signal we have to convert the signals into the digital by using the ADC. ADC play an very important role. The main function of ADC is to convert the analog signal received from a sensor into the digital form. The ARM controller used here has the inbuilt ADC functionality, with a 10 bit resolution. Hence external interfacing of ADC is not required to the microcontroller unit. Once the alcohol sensor senses the percentage of consumption in the form of analog value it send to the microcontroller unit . The microcontroller directly sends it to the ADC unit , which then convert it into the corresponding digital values.

Next part is the GPS traker , it's a satellite based system which drives independentely.It is directly connect to the main controlling unit using only 2 pins names as TXD and RXD. GPS has the capabilities to track the position in the form of Longitude, Latitude, with Date and Time. There are different version and types(size) of the GPS module

available in the market. It receives the location from the satellite for every second. It works using the NMEA protocols This information can be view in the serial monitor of the IDE used after programming. The NEMA protocol consists of 19 Interpreted sentences which starts with $GPxxx. This advantages of GPS makes it widely used in many applications like tracking and surveillance. This is much more accurate to about 14 ns.

The last important part in this prototype model is the GSM module. This module available in market in many size and shape with variable price like SIM900, SIM700, SIM800, SIM808 etc. Before interfacing one has to choose the appropriate module which suits the application. This module is interface to any microcontroller with the help of UART protocols. It helps in sending receiving data over GPRS, send and receive SMS, make and receive voice calls. To activate any fuctin listed above one has follows some AT commands. AT commands is used to configure the system to perform like a call and SMS. The power input to this module is 12 V, 2A. It has built in LED to show power on and off, network leds. When modem is powerd up the network led starts blinking and when the network registration is over , it starts to blink every 3sec. Testing can be done in serial monitor by using the 'AT' command which return back 'OK'.

So the model is equipped with a smart technologies, now if a driver is totally drunken then the System will never start.Through programming the system threshold value for the percentage of the alcohol consumed is set. The proposed flow diagram shown in figure 2 describes the working of the whole system. After the power is turn on all the devices goes to the active state. The Alcohol sensor is continuously sensing the alcohol is consumed or not by the driver. If the driver has not consumed the alcohol then the vehoicle will run smoothely. There is no disturbanvce from the end of the smart sensors implanted inside the vehicle. The system is designed in such a way that, if the percentage of alcohol consumed is less than 30 % than the vehicle engine gets on and it work in normal mode. If in case the percentage of the alcohol consumption is more than the threshold value then the ignition never starts and its send an imformation to the relative of the driver. By using the GPS module and GSM module installed inside the vehicle. GPS module detects the exact location of a vehicle with Longitude and Latitude. Whereas GSM module will send information about the longitude and Latitude to relatives of the driver.

Simulation Results

The below algorithm gives an idea of how the setup works for a single run of the code.
Step1: Include all Header files.
Step2: Declare different functions used and global variables.
Step3: Define delay functions and LCD related functions are being declared.
Step4: UART function was defined
Step5: ADC function was defined.
Step6: Then Alcohol sensor related functions are being declared.
Step7: Main function is started and different variables used in the program are declared.
Step8: Both the codes of GSM+GPS have been merge together and their function declared
Step9: PWM function was defined
Step10: last step is to compile , debug and create the hex file.
Step11: when the hexadecimal file is created using the IDE, it has to be uploaded using the flash magic to the target hardware.

The fig.3represents the interface between GSM SIM 800A Module with LPC2148 Microcontroller. Here we have connected the RX and TX pin of GSM to P0.0 and P0.1 of LPC2148 respectively. Here we have successfully sending the message via GSM through microcontroller as per figure 4.After that we have received the messages shown in figure 5(a). When the alcohol consumption ratio is less than 20%,the motor will rotate in its normal speed (duty cycle 100%) shown in figure 6(a).When the alcohol consumption ratio is greater than 20% and less than 40% the speed of the motor will be reduced (duty cycle 50%) shown in figure 6(b).

When the alcohol consumption ratio is greater than 40%, the speed of the motor comes to halt (duty cycle 0%) shown in figure 6(c). The vehicle stop functioning. As soon as the motor will come to halt, a message will be sent via GSM specifying the location of that particular vehicle through GPS which is shown in figure b(b).

CONCLUSION

This proposed system is simulated and tested in lab conditions. It is observed that the system works well within the designed parameters. Usage of more powerful processors to do more heavy and complicated computation would enable implementing new techniques like machine learning that would make a study of the driver behaviour and take necessary actions. This would be more appropriate to use of the machines we use are autonomous. So that the system can takeover the human activity and take everyone in the vehicle to safety.

ABSTRACT

In microprocessor the large SRAM arrays are used which occupies major portion in the die and it is extremely essential to have optimized larger arrays of memories for the smooth functioning of the chips. In this work a 6T SRAM cell is designed in cadence Virtuoso and the power dissipation of 753.9µW and write time and read time were observed to be 80 ns and 10ns respectively. Further a a dual port SRAM is designed using CMOS 180nm technology in order to achieve high speed and low power consumption. To validate the result simulation are carried out in cadence platform and both front end and back end analysis were performed.

Keywords: SRAM, Delay, Power, VLSI, SoCs

INTRODUCTION

Since the evolution of System on Chip technology, memories have become the indivisible part of any VLSI system. The Traditional RAM has been classified into SRAM and DRAM[1-3]. Memory is the ability to hold information irrespective of whether it is a computer memory or human memory. There are three stages for processing of theinformation.1. Encoding: Receiving the appropriate information/data, 2. Storing: Holding the received information/writing the data3. Retrieving: Reading the data.

Computers store programs/data in the form of bits, and each bit is stored in a cell commonly called “memory cell”. A memory cell is the basic unit of a large storage device. The memory cells are categorized among volatile and non volatile memory. Various research groups around the globe are working on emerging technologies like PCRAM, MRAM, FERAM and ReRAM [4-6]. They are considered to be the potential replacement for the traditional SRAM, DRAM, and flash memory. Phase change memory is based on the material called the phase change element. These are widely used in optical storage devices, compact disc. Though it has denser structure than MRAM but it still needs further improvement on density and endurance. Magnetic RAM has shown much potential advantage over

Phase change RAM, but its complex configuration is one of the major challenges towards its implementation in the next generation memory.

The Magneto resistive RAM and Ferroelectric RAM are poorly scalable and requires large programming current during write cycle which led high power dissipation. The popular volatile memory cells are SRAM and DRAM which are well known for its high speed and are used in cache memories. SRAM contains at least 4T which leads to higher memory density [2]. The memory density can be reduced by using DRAM, which can be designed even by using a single transistor but it needs to be refreshed periodically which increases the power consumption and added to these disadvantages both SRAM and DRAM are volatile memories. Single-port SRAM enables only one read/write operation at a time where as dual-port SRAM allows number of read/ write to happen at the given time. In this work a 6T SRAM cell is designed and discussed in the subsequent sections. Beside a Dual Port SRAM cell is designed at both Front end and Backend its design parameters are analysed.

BLOCK DIAGRAM AND STATIC MEMORY OPERATION

Fig.1shows the block diagram of dual port SRAM. The input dual port SRAM consists two address lines for PORT A and PORT B each consisting of 6-bits. Further 8-bit input data lines are present for PORT A and PORT B. Beside their write enable signals are present for PORT A and PORT B. Finally, a clock signal is present which assist in synchronizing between PORT A and PORT B. Similarly, there are two data output ports A and B. The resulting structure consists of two 64×8 dual port SRAM.

The basic SRAM cell consists of two cross-coupled inverters and two access transistors. At the gate terminal of access transistor word line is connected and to source/gate terminal bit line is connected. The work of word line is to select the cell while bit lines are used to perform read and write operations on cell. Initially the cell holds stored value on one side and its complement on the other side. Let us assume initially q holds the stored value and qbar holds the complement of the stored value. These two complementary lines are used to enhance noise rejection and speed. The 6T (Transistor) Static RAM cell is shown in Fig.4.9. Here there are two pairs of cross coupled inverters. Suppose in the pair of inverters the PMOS is replaced by resistors, as now only 4T are used to make the cell, hence the name 4T Static RAM cell. The current through these resistors can be made small by using high pull-up resistances.

There are three possible mode of operation Write Operation, Hold Operation, Read Operation The data is written to the memory cell by driving the word line and bit line high. To hold the data that is written, the Bistable inverters are disconnected from the bit line by driving the word line low. The Read Operation is initiated by precharging the bit and bit bar lines high and activating the word lines, either of the bit line discharges through the NMOS of any of the inverter creating a differential voltage between the bit and bit bar line, which can be read by the sense amplifier. The Read and Write Operation of SRAM cell is shown in the Fig.2. Following table 1 explains the performance analysis of SRAM cell

IMPLEMENTATION OF DUAL PORT SRAM IN CADENCE

Verilog Code has been implemented to obtain all the top modules in cadence platform. It follows following tools to obtain both front end and backend result

- To Run Simulation: NCLAUNCH tool is used. Using this tool with implementing the test bench code the simulation result is obtained
- To Obtain RTL: RTL compiler tool is used for obtaining the RTL schematic of the design
- Synthesis Part: This section consists of converting RTL to GDSII, floor plan, power plan, placement, routing, pre and post timing analysis

RESULTS AND DISCUSSION

a. **RTL Diagram:** The RTL of the dual port SRAM has been obtained using Encounter RTL compiler. It can be observed from the result that the RTL Contains all the modules of the SRAM
b. **Simulation Waveform of the RTL:** To validate the RTL obtained for the dual port SRAM has been simulated using RTL Compiler in cadence platform. The result validates the successful execution of the read and writes operation of dual port SRAM.
c. **Timing Analysis:** For the proposed design the timing conditions is verified and it is observed to meet the requirements. The total time delay has been found as 5.60ns
d. **Cell Report:** After compilation of RTL using RTL compiler the number of cells of each module and power is obtained. It has been found there are total 65.539 number of equivalent gates are available,
e. **Backend Design:** For backend design the RTL is converted to GDSII by using ENCOUTER tool. Here netlist is imported to obtain GDSII. In this part , floor plan, power plan, placement, routing , pre and post timing analysis is being done and the layout of Dual port SRAM is obtained and shown in the below figure 6.

CONCLUSIONS

In this work we have successfully designed a 1-bit SRAM based memory cell using cadence virtuoso and investigated the power, delay and Memory access. Further in order to read/Write more number of bits from the memory cell a Dual port SRAM is designed using Verilog hardware description language. In addition to that RTL synthesis and Layout of the chip is designed. It is found that our proposed design work as desired.

ABSTRACT

FIFOs are widely used for the purpose of on-chip data memories. The condition essential for the correct operation of FIFO is that the read pointer value to be sent to the write clock domain and the write pointer value to be sent to the read clock domain. FIFO memories are built using dual-port SRAM memory, where the 'Empty' and 'Full' condition of the memory is observed. In this paper a 32 bit FIFO is designed using dual port SRAM is designed which was found to be area efficient as less number of logic gates were utilized and delay was found to be considerably low as 27.136ns

Keywords: FIFO, SRAM, Synchronous, Delay, VLSI

INTRODUCTION

In all the complex digital circuits there are multiple number of circuit boards available and always exchange of data between them occurs. Hence, there is need of intermediate stages contacting memories receiving the data at the receiver end of circuit boards at high rate or in batches, but it is processed irregularly and slowly. Basically, the memories act as intermediate blocks which works at different speed. The first in first out (FIFO) memories has characteristics of the data that is entered at the first instant are getting out first from the queue. FIFO memories can be used as shift register. A FIFO memory is an electronic storage usually used between two subsystems. It has two control signals i.e. write and read. The data is written to the memory when write is enabled and data is made removed from the memory to make space for other incoming data when read is enabled. In Microcontroller peripheral the incoming data is stored using a FIFO memory asynchronously. But it cannot be read immediately. In hardware implementation the FIFO memory is used for synchronisation purposes. The FIFO memory is implemented as circular shift or queue having two pointers i.e. pointer for read and pointer for write register. To increase the bandwidth and as well as to prevent loss of data during communication the FIFO memory are used. To indicate the empty and full condition the FIFO has status flags [1-3].

When there is no dependences between reading and writing of data it's called as concurrent FIFO. In this type of FIFO both read and write operation occurs simultaneously with overlapping i.e. with different frequencies two systems are connected to FIFO memory. FIFO are basically of two types namely synchronous FIFO and asynchronous FIFO. Synchronous FIFO requires free running clock from both read and write systems. Write Enable is used to control the write operation synchronised with clock signal (write). By using the free running clock full status signal line is controlled with synchronisation with write clock [3]. The Figure 1 shows the block diagram of synchronous FIFO with its inputs and outputs

ARCHITECTURE DESIGN OF FIFO MEMORY

To overcome from the limitation of long exaction time in Long FIFOs, the a system should not shift the data words through all the memory locations. This problem is resolved by using circular memory having two pointers. Here the incoming data memory address is in write pointer. The 1st data word address in the FIFO to be read out will be in 2nd pointer i.e. read pointer. Both read and write pointers indicate to the same location of memory after reset. Write pointer points to the next memory location after the write operation. The read pointer points to the read of next data word which will be read next. Read pointer constantly follows the write pointer. The empty status of the FIFO determined when read pointer reaches write pointer. The full status of FIFO is determined if the write pointer catches the read pointer.

A dual port SRAM is used with the FIFO memory for storage. The pointer act as binary counter to generate memory address. It is better choice to have 2nd memory locations as pointer is implemented as n-bit counter. The read pointer generates read addresses and writes pointer generates address of write. The following figure shows the FIFO with dual port SRAM. It can be also designed other non-volatile memories such as RRAM [4-6].

ASIC IMPLEMENTATION OF FIFO MEMORY IN CADENCE PLATFORM

Verilog Code has been implemented to obtain all the top modules in cadence platform. It follows following tools to obtain both front end and backend result

- To Run Simulation: NCLAUNCH tool is used. Using this tool with implementing the test bench code the simulation result is obtained
- To Obtain RTL: RTL compiler tool is used for obtaining the RTL schematic of the design
- Synthesis Part: This section consists of converting RTL to GDSII, floor plan, power plan, placement, routing, pre and post timing analysis

RESULTS AND DISCUSSION

RTL Diagram: The RTL of the FIFO memory has been obtained using Encounter RTL compiler. It can be observed from the result that the RTL contains all the modules of the FIFO memory.

Figure 6 shows the top module of 32-bit FIFO Memory. From the module it can be observed that the design has 32-bit data input and output along with Read and write signal, clock, enable and reset. The output of FIFO register also indicates the two status flags for empty and full. To validate the RTL design of FIFO memory the test bench code has been generate and compiled using RTL compiler and simulated wave form is obtained in SimVision as shown in the figure 6

Timing Analysis: For the proposed design the timing conditions is verified and it is observed to meet the requirements. The delay due to gates has been found as 14.309ns and the delay due to routing wires has been found as 12.827ns. Thus, the total time delay of FIFO memory has been found as 27.136ns

Cell Report: After compilation of RTL using RTL compiler the number of cells of each module and power is obtained. It has been found there are total 4,728 number of equivalent gates are available. When implemented with Xilinx ISE it has been found there are 106 number of 4 inputs LUT among which 42 number is used as logic, 65 number used for Dual Port SRAMs, 71 number of bonded input-output blocks, and 32 number of input-output flip-flops.

Backend Design: For backend design the RTL is converted to GDSII by using ENCOUTER tool. Here netlist is imported to obtain GDSII. In this part , floor plan, power plan, placement, routing , pre and post timing analysis is being done and the layout of FIFO memory is obtained and shown in the figure 7

CONCLUSION

The FIFO memory augmented with SRAM is designed in cadence platform both in frontend and backend using CMOS 180 nm technology library in cadence. The presented work implements multiple read and write operations under the impact of single clock. From the wave forms it is observed that the proposed FIFO design was able to track empty and full flag status. Our design comprises of 4,728 logic gates and delay performance was found to be 27.13ns.

ABSTRACT

A model of an algorithmic processor intended to perform the conversion of halftone pixel image utilizing Floyd Steinberg algorithm which enable to transform M-row N-column array of pixel array into a pixel of black &white having a resolution of N-bits. A technique called weighted average error is utilized to convert the given image having a resolution of N-bits to a halftone which is also called as 1-bit pixel. This is a substitute to image depiction, translation, storage, It provides an alternative for image depiction, rendering, storage and broadcast in place where unremitting tone of the image.

Keywords: Floorplanning, VLSI, Layout, Image processing, RTL

INTRODUCTION

In graphic and printing industrieshalf toning technique is widely used over a long period of time, traditional photograph method is replaced by digital techniques and it is well known that digital techniques scores over the traditional techniques. The attained halftone image can be portrayed easily in device ruled by binary gadgets. This makes the storage and processing of image easier. This technique lowers the image intensity for the best feasible reproduction and is widely used in printing factories. It is found that unremitting tone display causes discrepancy between representation and portraying ability as it encountered with constraints such as low cost, minimal system complexity and bit resolution is low [1-2]. It also lowers the depth of bit which makes it optimal for Error resilient transmission. Halftone image in mass printing media is produced the technique of screening. Prior to the era of digital images distinct photographic methods were used to perform the disruption of gray images into discrete points. [3]

The historic techniques basically use the screening in which before the exposing of screen camera, the screen of course-woven was suspended, breaking the light into dots pattern through diffraction effect and interruption together. By using the techniques of photo etching printing plates are being created.Resolution which is measured in lines per inch can be the amount of lines of dots in one inch, measured parallel with the screen's angle called the screen ruling. The resolution of a screen is written either with the suffix lpi or a hash mark; as an example, "150 lpi" or "150#".The higher the pixel resolution of a sourcefile, the greater the detail which will be reproduced. [4-5]

Floyd-Steinberg Algorithm

Floyd-Steinberg algorithm converts an image consisting of an N×M array of pixels, each having a resolution of pixel size, pixel_sizebit into an array having only black or white pixels, while incorporating a subjective measure of the quality of the image. The algorithm distributes to a selected subset of each pixel's neighbors the roundoff error induced by converting the pixel from a resolution of n bits to a resolution of 1 bit.The error distribution is calculated based on selected neighbors weighted average errors. The error distribution of neighbors received by a pixel which is used to calculate halftone pixel value (i,j) of the cell of N×M array with its origin value. The Data flow graph is obtained from the above relation that holds for each cell. Data flow graph nodes execute the conversion of pixels according to the following Pseudo code [6] The average error E_av can be expressed as

$$E\_av = (w_1 * e[i-1, j + w_2 * e[i-1, j-1] + w_3 * e[i, j-1] + w_4 * e[i+1, j-1]) / w_T \quad (1)$$

Where,

w_1, w_2, w_3, w_4 are the weights

$/w_T$= Total Weight=$w_1+w_2+w_3+w_4$

From the weighted average the corrected pixel value (CPV) is calculated as below

$$CPV = PV[i, j] + E\_av \quad (2)$$

According to the threshold value of CPV, CPV_threshold . Thus

CPV_round=0 if CPV<CPV_threshold

Else

CPV_round=CPV_max

For a 8 bit resolution image the CPV_max=255 and CPV_threshold=128

The halftone pixel value (HTPV) is formed and the error is saved as below

HTPV=0 if CPV_round=0

Else HTPV=1

Error [n, m] =CPV-HTPV

Sequentially the pixel array can be update by updating the row or column using nested loop program. The algorithm for sequential updating the pixels is executed using Verilog.

Implementation of Halftone Image Converter in Cadence

Verilog Code has been implemented to obtain all the top modules in cadence platform. It follows following tools to obtain both front end and backend result

- To Run Simulation: NCLAUNCH tool is used. Using this tool with implementing the test bench code the simulation result is obtained
- To Obtain RTL: RTL compiler tool is used for obtaining the RTL schematic of the design
- Synthesis Part : This section consists of converting RTL to GDSII , floor plan, power plan, placement, routing , pre and post timing analysis

RESULTS AND DISCUSSION

RTL Diagram: Using Encounter tool the RTL of the halftone image converter is obtained as shown in fig.1 and 2

Timing Analysis: For the proposed design the timing conditions is verified and it is found that it meets the timing requirements. The delay due to gates has been found as 25.734ns and the delay due to routing wires has been found as 24.82746ns. Thus the total time delay of converter has been found as 50.561ns

Cell Report: After compilation of RTL using RTL compiler the number of cells of each module and power is obtained. It has been found there are total 23,437 number of equivalent gates are available. When implemented with Xilinx ISE it has been found there are 2,129 number of 4 inputs LUT among which 2,004 number is used as logic, 436 number of bonded input-output blocks.

Backend Design: For backend design the RTL is converted to GDSII by using ENCOUTER tool. Here netlist is imported to obtain GDSII. In this part , floor plan, power plan, placement, routing , pre and post timing analysis is being done and the layout of halftone image converter is obtained and shown in the fig.4.a and 4.b

CONCLUSION

In this work an algorithmic processor intended to conversion of halftone pixel image utilizing Floyd Steinberg algorithm which enable to transform M-row N-column array of pixel array into a pixel of black &white having a resolution of N-bit. To begin with here an ASIC implementation of the converter is performed and the attained result is successfully verified at frontend as well as back end.It has been found there are total 23,437 number of equivalent gates are present.

ABSTRACT

Using the concept of Approximate computing the intricacy, delay and chip area can be reduced by permitting certain relaxation in output for inputs of few combinations. The minimization of circuit intricacy can be achieved by diminishing the population of components. In this work an approximate and exact Ripple carry Adder (8-bit) is designed using cadence. In order impinge approximate into the design a logic minimization technique is employed. Further, in order to validate the capability of the approximate adder two images are added with approximation and exact technique. Basically, a bitwise pixel addition of two images is performed using approximate and exact addition technique and it is observed that both the images are comparable.

Keywords: Ripple, performed, technique, area.

INTRODUCTION

Approximate computing is technique of computation which yields a conceivably non-exact result rather than a assured exact result and can be utilized for bids where approximate result is suffice to meet its purpose. This technique lowers the die area as well as delay and power consumption with a minimal negotiation with accuracy [1,2]. In literature techniques viz. cell minimization, truncation and logic minimization are widely utilized. In cell replacement method the module with more intricacy is substituted by its inferior circuit intricacy termed as approximate circuit, as result of which aberration in the anticipated output is observed and length of the critical paths is lowered. Another technique is truncation technique, where many versions of approximate adder circuit are designed by truncating the propagation of carry to higher blocks aimed at minimizing the delay; thereby achieving higher speed performance [3]. In segmentation method the modules with lower noteworthy blocks with approximate modules. Where as in order to lower the intricacy of the logic minimization method is used where bits of the

Karnaughmap are toggled thereby declining the complexity at the gate level. In this work a CMOS based approximate and exact adder is designed employing logic minimization method by using approximate SUM and CARRY expression, which lowered the number of gates [4].

METHODOLOGY

Verilog Code has been implemented in order to design the 8-bit Approximate and Exact adder.It follows following tools to obtain both front end and backend result:

- Approximate adder is proposed by incorporating intentional error in to the SUM and CARRY column of the truth table and the expression of SUM and CARRY is determined by minimizing the Karnaugh map.
- To Run Simulation: NCLAUNCH tool is used. Using this tool with implementing the test bench code the simulation result is obtained
- To Obtain RTL: RTL compiler tool is used for obtaining the RTL schematic of the design
- Synthesis Part: This section consists of converting RTL to GDSII, floor plan, power plan, placement, routing, pre and post timing analysis.
- Image processing studies is done using MATLAB simulation tool.
- Finally, approximate and exact addition of pixels is done using MATLAB.

APPROXIMATE ADDITION

The expression for the SUM and CARRY of the exact full adder is listed below in eq. 1 and eq.2

$$SUM = A \oplus B \oplus C \quad (1)$$

$$CARRY = AB + BC + CA \quad (2)$$

The minimized expression for the approximate adder is listed in eq.3 and eeq.4:

$$SUM = \sim AC \mid BC \quad (3)$$

$$CARRY = \sim AC \mid AB \quad (4)$$

The resultant sum and carry expression of Approximate and exact adder is achieved by deliberate incorporation of error in the sum and carry column of Approximate adder.

RESULTS AND DISCUSSION

RTL Diagram: The RTL of the Exact and Approximate 8-bit Ripple carry has been obtained using Encounter RTL compiler. It can be observed from the result that the RTL comprises of all the modules of the Ripple carry adder.

Simulation Waveform of the RTL: To validate the RTL obtained for the Approximate and Exact 8-bit Ripple carry adder has been simulated using RTL Compiler in cadence platform. The result validates the successful execution of exact and approximate adder.

Timing Analysis: For the proposed design the timing conditions is verified and it is observed to meet the requirements. The total time delay for the exact and approximate adder was found to be 304 pS and 171 pS.

Power analysis: The power consumption for the approximate and exact were found to be3441.650 nW and 4601.956 nW.

Cell Report: After compilation of RTL using RTL compiler the number of cells of each module and power is obtained. It has been found there are total 65.539 number of equivalent gates are available,

Backend Design: For backend design the RTL is converted to GDSII by using ENCOUTER tool. Here netlist is imported to obtain GDSII. In this part floor plan, power plan, placement, routing pre and post timing analysis is being done and the layout of approximate adder is depicted below.

Case Studies

In order to elucidate the capability of the designed Approximate ripple carry adder two images of identical size (m×n) is added which in turn produced a new image of the original size. 512 x 512 *cameraman image* is added with Rice image, it is found that the resultant image attained by approx. addition identical to the image obtained with exact addition. As it is shown in Fig.7

CONCLUSION

In this work we have successfully designed a8-bit Ripple carry adder (exact as well as approximate) using cadence virtuoso and investigated the power, delay and Area occupancy in the chip. In addition to that RTL synthesis and Layout of the chip is designed. It is found that our proposed design was area efficient as the number of components are reduced and it also resultingly reduced the power consumption and further due to the reduction of number components delay is also reduced.

ABSTRACT

The foremost apprehension of VLSI engineers is power loss associated with the integrated circuits. It is basically an enhanced variety of multiplier which is found to be tree-based. The main feature of this multiplier is it uses the phenomenon of carry save addition which in turn lowers the latency. In this paper a 4-bit Wallace tree multiplier is designed using cadence EDA tool. The both front end and back end design of the Wallace tree multiplier is discussed in detail.

Keywords: engineers, phenomenon, multiplier, circuits

INTRODUCTION

One of the most important hardware blocks used in the high-performance digital systems are DSP, µprocessor and filters used for FIR applications. Many research groups have exasperated and attempted to build multipliers which exhibit attractive features such as expedite speedand minimalpower dissipation and dense implementations. Normally when we consider arithmetic circuits the key issue associated with them are area as well speed. Whenever it is attempted to enhance the speed there is always a increase in the die area. It is widely seen that the throughput necessity of the controls the structure of most efficient multiplier. In order to achieve an efficient multiplier structure primary objective is to decide the finest circuit structure configuration. The multiplication can be achieved by employing serial and parallel multipliers. [1-2]. The operation frequency of the DSP processor can be enhanced by increasing the speed of computation of the multiplier circuits. When the working of the Wallace tree multiplier is considered it performs the multiplication of a couple of unsigned integers. It basically comprises of an AND array for determining partial product. In order to add the partial productsa carry save adder is utilized and obtained product and the carry is allowed to proliferate adder in the ultimate phase of addition. [3-4]

DESCRIPTION OF WALLACE TREE MULTIPLIER

Process of Wallace tree multiplier goes through three basic stages such as partial product, partial product addition and final addition. In the partial product stage the long-hand multiplications are obtained using AND gates and all products are done simultaneously. Figure 1 shows an example of Wallace tree multiplier operation

DOT PRODUCTION OF WALLACE TREEMULTIPLIER

Fig.2 shows the dot production of Wallace tree multiplier. From the figure it can be seen that there are N number of multiplicand and multiplier bits are available. All the partial products are obtained in parallel and then by using suitable adders such as half adder and full adders the final addition is obtained. Fig.3 shows all stage operation in sequence [5].

DESIGN TECHNIQUES OF HIGH SPEED WALLACE TREE MULTIPLIER:

The numbers of addition operation required in conventional multipliers are high. Three partial product terms can be added at a time to form the carry and sum using the carry save adder. At the next level, the sum signal is used by the full adder. As the output carry of first full adder is passed to next full adder as a result the delay is coming to the design. For N number of rows the total delay is proportional to logarithmic value of 3n/2. The first and second stage of the multiplication is only depends on direct input using and array. However, the final value depends on the carry out value of previous stage for the intermediate higher stages.This operation is repeated sequentially for the consecutive stages. Finally, it can be seen that major cause of delay is propagation of the carry out from the previousstage to the next stage. In conventional Wallace Tree multiplier structure, the totalnumber of stages in the critical path sums up to 13. Each full adder used accounts for a latency of 2. Total latency of the whole structure gives a total of 26. The latency count gets increased by 1, when considered the and array, which results the total latency. The overall delay can be reduced using the technique shown in the Fig.4 and 5.

IMPLEMENTATION OF HIGH SPEED WALLACE TREE MULTIPLIER USING CADENCE

Verilog Code has been implemented to obtain all the top modules in cadence platform. It follows following tools to obtain both front end and backend result

- To Run Simulation: NCLAUNCH tool is used. Using this tool with implementing the test bench code the simulation result is obtained
- To Obtain RTL: RTL compiler tool is used for obtaining the RTL schematic of the design
- Synthesis Part : This section consists of converting RTL to GDSII , floor plan, power plan, placement, routing , pre and post timing analysis

RESULTS AND DISCUSSION

RTL Diagram: The RTL of the FIFO buffer has been obtained using Encounter RTL compiler. It can be observed from the result that the RTL contains all the modules of the designed high speed Multiplier. To validate the RTL design of Wallace tree multiplier the test bench code has been generated and compiled using RTL compiler and simulated wave form is obtained in SimVision as shown in the figure 7. The result shows the correctness of design of Wallace tree multiplier

Timing Analysis: For the proposed design the timing conditions is verified and it is observed to meet the requirements. The delay due to gates has been found as 8.812ns and the delay due to routing wires has been found as 7.116ns. Thus the total time delay of the designed multiplier has been found as 15.928ns which indicates the designed Wallace tree is faster in operation

Cell Report: After compilation of RTL using RTL compiler the number of cells of each module and power is obtained. It has been found there are total 4,728 number of equivalent gates are available. When implemented with Xilinx ISE it has been found there are 33 number of 4 inputs LUT among which 19 number is used as logic, 16 number of bonded input-output blocks.

Backend Design: For backend design the RTL is converted to GDSII by using ENCOUTER tool. Here netlist is imported to obtain GDSII. In this part, floor plan, power plan, placement, routing , pre and post timing analysis is being done and the layout of designed multiplier is obtained and shown in the figure8

CONCLUSION

A 4 bit Wallace tree multiplier with less computation time is designed. The multiplier design proposed here utilizes minimal count of full assisting in lowering the chip area. Here, 4-bit Wallace tree multiplier is designed using CMOS 180 nm process and using the cadence EDA tool. Beside front end and back end design is performed and successful working of the Wallace tree multiplier is verified.

ABSTRACT

In many applications is required to devices to communicate each other in order to share some useful data.Today there are many protocol are available each of them and their merit demerits and many application area.In between them one of the most powerful serial communications is UART(Universal Asynchronous Receiver Transmitter. In this paper UART protocol which is a serial protocol used for transmission of digital data is presented. It requires only two wire to communicate from source to destination.In UART protocol data format and transmission speed are configurable .Serial communication conveys a single bit at a time .Transmission of digital data can be achieved by sending all the data in a single wire so that over all communication cost and transmission speed is reduced to half as compared to parallel communication.In Asynchronous, communication no clock signal is required to transmitter to receive the data from source for synchronize the data but for synchronous communication clock signal is required for both transmitter and receiver for synchronize the data.In UART connection if two device are there i.e. device1 and device2, device1tx(transmitter)is directly connected to device2 (receiver) and then vice versa. Both ground should be connected directly device1 to device2. Due to no clock signal in asynchronous the all the communication is based upon UART baud rate of 9600bps .And one start bit and stop bit in each data bit here parity bit(optional bit) is used by transmitter for error detection. The work is implementedin HDL Verilog and verify by UVM using Xilinx ISE 14.0 and Questasim2.0.

Keyword: VLSI, Transmitter, Receiver, Data Transfer

INTRODUCTION

In order to receive and send data in serial mode a device called UART is used. It exchanges data in ASCIIformat where every alphabetical character is encoded into seven bits and sends as 8 bit data. While during the process of

transmission it squash 8 bit sub-word where the first bit is LSB where as stop bit is considered as MSB consequently building it to a format of 10 bit word.

Start	Data 0	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7	Stop

Transmitter of UART basically fetches the data in parallel format and instructs the UART to send in the format of data in serial. Similarly, receiver must perceive the data in serial style, strip of the start and stop bits, and store the data word in a parallel format. As it is well known that the working of the UART is asynchronous in nature receiver is not aware of what data it will receive a local clock is generated tosynchronize the transmitter as and when acceptance of start bit. When the process of transmission is asynchronous, the data can be sent without the reception of clock signal from the receiver. The transmitter and receiver agree on timing parameters in advance and special bits are added to each word which is used to synchronize the sending and receiving units. When a word is given to the UART for Asynchronous transmission, a bit called the "Start Bit" is added to the beginning of each word that is to be transmitted [1-3]. The job of start bit is to aware the receiver of the of what data word it is supposed to be sent and forcefully synchronized the clock of transmitter as well as receiver. Upon the sending of Start Bit, individual data bits of the words of the data are transmitted where first bit is the LSB. During transmission, the time of transmission of all the bits is exact and receiver "looks" at the wire at approximately halfway through the period assigned to each bit to determine if the bit is a 1 or a 0

UART CONNECTION DIAGRAM

The serial port of UART IS basically a 9 pin architecture, which provides asynchronous communication widely, called as RS-232. The UART component can be configured for Full Duplex, Half Duplex, Rx only or Tx only versions. Configurable buffers are provided in order to process receive and transmit data with the help of UART. In order to configure the UART by choosing proper BAUD rate, parity and number of start bits [4,5].
It indicates the Baud rate must be fixed. To support the UART variations commonly used, the component provides configuration support for the number of data bits, stop bits, parity, hardware flow control and parity generation and detection.

METHODOLOGY

The UART protocol has been implemented in Xilinx ISE 14.0 using Verilog HDL code. The Top module and RTL of both transmitter and receiver obtained after the synthesis. The UART protocol has been verified by using number of test cases in Questasim2.0 to validate the correctness of implemetnatio of UART protocol.

RESULTS AND DISCUSSION

RTL Diagram

The RTL of the transmitter and receiver has been obtained using Xilinx ISE. The Top module of both transmitter and receiver is sown in Fig.2 and 3.The top module and RTL of transmitter is shown in the Fig.2.aabd 2.b respectively. From the top module of transmitter it can be observed that the inputs to the modules are clock, load, reset, shift and select. The select input basically control the whether the operation is load or shift and the outputs of the transmitter module are CS, Txd and ready. The RTL of the receiver has been obtained using Xilinx ISE. The Top module and RTL of receiver is shown in Fig.3.a and 3.b

Simulation Waveform

To validate the RTL of both transmitter and receiverdifferent test cases are taken to verify the working conditions,

Test Case 1:D_{in} and parity_e_o randomized with constraints reset==1'b1;tx_enable==1'b1, here reset=1 that means signals are in ideal conditions, this test case verifies the reset signal

Test Case 2: D_{in} and parity_e_o randomized with constraints reset==1'b0;tx_enable==1'b0, this test case shows, here tx_enable==0, means no transmission operation occurs. This test case verify the tx signal.

Test Case 3: D_{in} and parity_e_o randomized with constraints reset==1'b0;tx_enable==1'b1, this test case shows, here we are sending one data frame and all signals are transmitting as well as indicates the transmission operation of UART.

Test Case 4:D_{in} and parity_e_o randomized with constraints reset==1'b0;tx_enable==1'b0 here we are repeated this process five times successfully.

Test Case 5:D_{in} and parity_e_o randomized with constraints reset==1'b1;rx_enable==1'b1, this test case shows, here reset=1 that means signals are in ideal conditions, this test case verify the reset signal

Test Case 6:D_{in} and parity_e_o randomized with constraints reset==1'b0;rx_enable==1'b0, this test case shows, here rx_enable is low, means no data will be recieved. This test case verify the rx signal.

Test Case 7:D_{in} and parity_e_o randomized with constraints reset==1'b0;rx_enable==1'b1, this test case shows, here we are receiving one data frame as well as indicates the receiver operation of UART

Test Case 8:D_{in} and parity_e_o randomized with constraints reset==1'b0;rx_enable==1'b0 here we are repeated this process five times successfully.

CONCLUSION

In this paper the UVM frame was presented. The "Top". Inside the "Top" was created along with "Environment", "Read Agent", "Write Agent" and "Test". After successfully creating the UVM frame the logic was developed according to the assigned UART protocol. The logic for driving the signal to interface and for extracting the signal from interface and sending it to scoreboard while monitoring it was also developed. The results obtained validate the successful implementation of UART protocol.

ABSTRACT

Memristor (Memory-Resistor) are two terminal device of nanometer size, they lie in between nanodevices and electronics therefore it is a type of nano electronic device. In this work Verilog A model of memristor is used to design sequential circuits using hybrid memristor and CMOS transistor. The designed digital logic circuits were found to work with proper functionality. As the size of the device lies in nanoregime and as it can employed as memory as well as logic element, hence it would provide the privilege of thinking beyond Von-Neumann Architecture.

Keywords: Memristor, MRL, Non-volatile Memories, RRAM

INTRODUCTION

Memristor (Memory-Resistor) are two terminal device of nanometer size, they lie in between nanodevices and electronics therefore it is a type of nanoelectronic device. The common analogy for the esistor is a water pipe, where the flow of water is similar to the flow of charge (electric current) and pressure applied at the input of the pipe is analogous to the voltage applied. Memristor is a pipe where the diameter of the pipe dilates when water flows in one direction and shrinks when the water flows in the opposite direction.As the name "memory resistor" implies it is a non-volatile random access memory (NVRAM) [1-3]. This class of devices on switch off, the data is not lost. It is widely used in the application of Artificial Intelligence, which can be used to artificial brain mimicking the functionality of the animal's brain in a system-on-chip. This behaves like an artificial synapse and neuron can be built with aid of it [4,5].

METHODOLOGY

In this work a Verilog A model of memristor is used to create a symbol of the memristor in the cadence virtuoso tool. Once the symbol is created it is instantiated into the virtuoso window and it is utilized to design Memristor sequential circuits.

RESULTS AND DISCUSSION

Previously few works has been reported on the application of Memristor in combinational circuits. Here a case study is performed in order to test the application of Memristor in sequential circuits. The working of SR and D Flip-flop is verified by utilizing the Memristor based NAND gates are presented in this section.

Memristor Based SR Flip-Flop

This is otherwise termed as SET-RESET Flip-flop. Initially assume that q=0, qbar=1 and clock (clk) =1. When both the inputs S and R are "0", it is observed that there is no change in the value of q and qbar. The Fig. 2 depicts the above case. It is called as SET-RESET Flip-flop because the value of q depends on the input S and R.If the input S is high then q=1, which implies that the Flip-flop is in SET condition. The Fig.3 depicts the above case. If the input R is high and S is low then q=0, which implies that the Flip-flop is in RESET condition. The Fig.4 depicts the above case.When both S=R=1 it is an invalid condition as both the values of q and q' turns high which is practically impossible. The Table-I shows the truth table of SR Flip-flop.

Memristor Based D Flip-Flop

The D Flip-Flop is designed from the SR Flip-Flop by connecting both ends to the two ends of an inverter. It stores the data present in the D input at every positive edge of clock. It is otherwise called transparent latch as both the input and output are same. The Fig.5 represents schematic and Table-II represents the truth table of the Memristor based D Flip-Flip. For the device to operate properly D input must be stable for some time before the positive edge of the clock. This time period is defined as setup time. Even after the positive edge of the clock for a small period of time the latch holds the input, so that the input signal can be sampled properly. The above truth table is verified in Fig.6 and Fig.7 for the input of "0" and "1" respectively.

CONCLUSION

In this work a Verilog A model of Memristor prepared by incorporating the Verilog A code into the Cadence Virtuoso. The design was found to be power and energy efficient as it is designed using area and power efficient nanoscale memristor. This work paves the way for future implementation of memristor in logic design applications.

ABSTRACT

Worldwide everything becomes digitize with the evolution of digital technology. The digitization help to reduce complexity of access anything or anybody, even due to digitization everything can be digitally store. Barcode system is one of the kinds which assigned to each category of product to make easy to maintain database of product as well as access all the information about the product. In this paper a method has been proposed to detect bar code on a product. This process is very necessary before recognizing the bar code. The processes of detection involve segmentation and morphological operation to detect the line pattern on an scene image. The method has been tested in different category of barcode and giving around 95 % result.

Keywords: barcode, computer vision, segmentation, morphology

INTRODUCTION

In the recent era, everything becomes digitized, with the help of evolution in digital world every where the system becomes digitized starting from online purchasing of goods to offline purchase of good. Even the house hold grocery items have some digital information in the seller digital computer. Due to this digitization the consumption of time for completion of a process get reduced, even the human effort also getting reduced. In place of human being the computer system are getting replaced. Even human brain can perform any mistake, but the trained system work accurate as well as faster. Any products which are digitally available to the consumer should have digital information available in terms of barcode. When products are available in a store the store owner should keep a rack of the product. The product data base is maintained to maintain the database and delivery of the product with faster billing to costumers. The store manager coded each product with a bar code in which the details about the product embedded into it. Even in the industry where the product manufactured also made such barcode to each product during manufacturing process. The barcode contain all information related to the product [1]. By this process each product can be differentiated form each other even if similar products can be categorized to separate group. The

main part of the system is the delivery to customer, during the process the each product need to billed using a bar code scanner [2, 3]. The barcode scanner work is to detect barcode and scan it and extract the information embedded with it which called as barcode recognition. But before recognition, the most important part is to detect the location of barcode for the system. This paper focuses on a simple approach to detect the barcode using computer vision and image proessing technique.

Computer Vision and Image Processing

Computer vision is a field of science and technology which train the machine to visualize the real world like human eye and took decision [4]. It performs the task with the help of devices like digital camera and some image processing technique. The image processing is the technique to extract information from the capture through some processing algorithm. The image processing technique involves different methods like image acquisition, enhancement, segmentation etc.

Barcode

A barcode is generally a visual of black and white pattern. This is a kind of method to represent information in visual graphics form which can be understood by machine. The barcode patterns are black and white pattern of parallel line or random pattern. The barcode first invented by NJ Woodland and B Silver and patented in US. And it took years to make the bar code commercialized. The barcode are broadly classified into 1D (one dimensional) or 2D (two dimensional barcode.). Universal Product Code (UPC) code, EAN Code, Code39, code 128, Code39 are some types of 1D type bar code where as QR Code, data matrix code, Aztec Code are some types of 2D type barcode[5]. The UPC code was first developed to code the products, but now days it has been spread to almost every filed even in the identification card also include QR code.

Bar Code Detection Methodology

Before extraction of the information from the bar code, the system has to detect the barcode after taking a picture through the digital camera. The detection of bar code methodology has been given as a flow diagram in figure 1.
The implemented method involves the following computer vision operation:

- Color conversion
- Image Segmentation (Gradient)
- Image Thresholding
- Image Morphology
- Contour Detection

As the capturing device follow the RGB color model, so the capture image through device like camera rae of RGB image. First the color image has been converted to gray scale image and the captured image become a mono chrome image..Segmentation is the process of subdividing the image into sub region, but line and edges detection are part of segmentation [6, 7]. The edge detection can be performed vertically as well as horizontally which detect both horizontal and vertical edges of the gray scale image. A barcode always has a very high horizontal gradient and a very low vertical gradient. So for bar code detection the vertical gradient is getting subtracted from horizontal gradient.

After the both the gradient detection, both the result get subtracted which form a gradient image. The resulted image has gone through an averaging operation to make the resulted image smooth via blurring operation. The smooth image has been thresholded using binary thresholding method, so that the resulted image becomes a black and white one. The thresholding operation will separate the image in to two segment based on the histogram. Image morphology is that operation which helps to extract structure of image for representation and description. Dilation and erosion are the two very basic operations under morphological operation. Dilation generally thicken the boundary where as erosion reduce the boundary width [6, 8]. But here both the operation used using a specific type of structuring element which fill the gap between bars and also remove the unwanted region and leaving behind the

significant region as contours.. Finally all the contours of the morphological image have been determined and the larger counter will be detected and kept within a rectangular bounding box [9]. The larger contour represents the barcode region. The result after each step is shown in figure 1-9 The method of barcode detection has been implemented on varieties of barcode images printed on items like books, cosmetics, food products etc. The resulted bar code detected images have been shown in figure 11. The method is very simple and it working fine with most of the image , but some time it give false output which are due to effect of improper illumination.

CONCLUSION

In the digital era every product can be digitally accessible by coding with an barcode. The information about the product can be easily access by a barcode scanner. The vital task of a barcode scanner is to detect the barcode. This paper implement a image processing approach based on segmentation and image morphology to detect the bar code region. The method has been tested among different varieties of producyt image and giving aroung 95% of accurate result but in some cased due to poor illumination the detect giving false result. This method is only applicable for two dimensional barcode. In future the complete barcode detection as well as recognition can be implemented using the computer vision.

ABSTRACT

In present scenario, the physical classes is quiet not possible, so every where online classes are preferable by the institutions. Most of the electronics designs are used using the physical components and the virtual simulation of such electronics design is necessary for online classes. For the simulation of such design MATLAB and Simulink tool is a well structure and organized available tool. The MATLAB deals with high level complex computation where as simulink deals with graphical programming for modeling of system. This paper presentenced a virtual simulation of electronics circuit (full wave bridge rectifier) for online tutorials though physical design using simulink tool. The simulation result has been compared with the theoretical concept to verify the correctness of the model design in simulink. This type of digital simulation of physical system will be beneficial for online classes. A library called Simscape has been used for physical modeling of the electronics system.

Keywords: physical design, simulink, Simscape, virtual simulation

INTRODUCTION

The electronics circuits can be developed physically using the physical components designed on a breadboard and can be tested with real time with application of voltage. But in the current situation of world with effect of COVID 19, most of the institutes are focusing on online classes [1, 2]. The online classes can be more effective when the physical design can be performed with digitally through online. So the virtual simulation of the physical electronics circuit design is very much necessary. Even in the other way virtual simulation with provide ease of analyze the output for different set of parameter. So it is better to design any circuit virtually and simulate it prior to real world physical design. Even if the physical components not available then also different online virtual lab different electronics circuits can be developed.

In this paper simulink has been used for the digital simulation. Simulink is a tool combined with MATLAB and both the tool which are preferable for engineering simulation as well as physical design of dynamic system. It is vastly used tool worldwide across all discipline [3]. In this paper a bridge rectifier has been chosen as a basic electronics for virtual simulation. Simulink is a model based simulation tool based design environment. Basically it comes integrated with MATLAB developed by the company MathWorks. MATLAB has been developed for the high level computation where the simulink has been developed by physical modeling. Simulink is a kind of graphical pick and place based programming language for system modeling. Most advantage of the simulink is that it is used for analyzing the dynamic system in an organized way. The simulink has different library of blocks sets like control system toolbox, communication system tool box, simscape, state flow etc. It also include basic block set library like continuous, discontinuous, sink, sources, Math operators etc. Simscape block set library used to create models of physical systems within the Simulink. Physical model can be implemented with physical inter connection which directly block diagram and other resources. More complex analysis can be possible with the Simscape library [4, 5].

Full Wave Bridge Rectifier

A rectifier is an electronics device which convert unidirectional to bidirectional signal or in simple word alternating current to direct current. This is again dived into two types: Half wave rectifier which can able to convert only positive or negative half cycle, where the second category is full wave rectifier which can able to convert both the half cycle into direct current. Actually the rectifier alone can't able to convert as pure dc rather it can be possible with the help of capacitor, inductor or combination of both filter. The full wave bridge rectifier is a combination of four semiconductor PN side arrange in a bridge connection [6, 7]. Te arrangement is such a way that it can able to convert both the half cycle in to a positive wave form. The circuit diagram with all the connected components with the output waveform shown in figure 1-2.

Experimental Implementation with Simulink

The Simscape library contain some foundation library as well as Electronics, Hydraulics, Mechanics and power system related physical block set with some utility block set. The semiconductors components require to design the full wave bridge rectifier are available in Electronics section called as *SimElectronics*. The following block sets required to designed the circuit are shown below with their location where available

- Semiconductor diode: Simscape/SimElectronics/Semiconductor Devices/Diode
- AC Voltage Source: Simscape/SimElectronics/Sources/Voltage Source
- Electrical Elements:
  Simscape/Foundation Library/Electrical/Electrical Element/Capacitor
  Simscape/Foundation Library/Electrical/Electrical Element/Resistor
  Simscape/Foundation Library/Electrical/Electrical Element/Ideal Transformer
  Simscape/Foundation Library/Electrical/Electrical Element/Electrical Reference
- Utility block-Simscape/Utilities/PS-Simulink Converter
- Simscape/Utilities/Simulink-PS Converter
- Simscape/Utilities/Solver Configuration

The following steps can be followed to designed the physical modeling as a simulink model using Simscape
Steps:

1. Create a new model on simulink
2. Select the required block from the respective section of the package.
3. Add them to the model
4. Place the component at appropriate place with proper orientation
5. Connect the block as per the circuit diagram to get the bridge rectifier circuit model

For the complete functionality of the circuit design, it needs to connect some more blocks. The voltage sensor will be connected at output load will receive the physical output values which can't be shown there directly. It has to be connected to a scope through a PS-Simulink converter, which convert the physical output to a simulink output. Now through a scope it can be visualized. Each physical model designed in Simscape block diagram requires solver settings information for simulation. The Solver Configuration block specifies the solver parameters that your model needs before you can begin simulation.

Then after set the model configuration parameter, the model has been executed, the execution will be performed for a specific time mentioned during the configuration parameter. The output graph can be shown through the scope. The designed model first simulated without using the capacitive filter and the resulted graph able to convert both the cycle into positive wave form, but the output is not the proper dc. It is a kind og pulsating dc due to presence of some ripple. In the second phase the model has been simulated with a connected capacitive filter at the output. The result achieved was a perfect dc. This is due to the fact that the capacitors bypass the ac component to ground and all dc components will be passed to the load as the capacitor connector parallel to the load. The designed circuit and the simulation result have been shown in figure 3-6.

CONCLUSION

The paper presented the implementation of electronic circuit using the Simscape physical modeling library of simulink. This library greatly helps in multi domain physical system. For modeling and simulating electronics circuit a full wave bridge rectifier has been chosen. The model simulated in two cases one with the use of capacitive filter and another without using the filter. The output signal than compared with the theoretical concepts of the full wave bridge rectifier, it performing 100% same result as pet the theoretical concept. The digital implementation of the circuit design and simulation has a great impact on the online classes, now it can be proved that even online classes has the experimental simulation of hardware circuit through the digital representation. In future it can be extended to design OPAMP based circuit such as differentiator, integrator and oscillator.

ABSTRACT

A broadband rectenna is designed and simulated which is applied to wireless energy Generation. The Rectenna is designed using two software tools named as HFSS and ADS. After the design, they are mapped into same platform to compare their result. In this paper, the ractifying antenna designed is operated at 2.4GHz which consist of spilled four element array structure, series fed of dual element array and antenna parts Specially for the near field study this array structure is adopted to adopt different power density. To minimize the substrate loss, squeezed small-shape air supported microstrip antenna is designed. In this paper, the capacitance is substituted by microstrip line in the form of dc pass filter and the diode in the rectifying circuit is connected in sequence. The energy conversion efficiency from RF energy to DC electrical energy reached 80.25% by maintaining 20.85 dBm and 3501 ohm resistive load through repetitive experiment respectively. So maximum 18.55 volt of DC output voltage is observed and noted during simulation. The entire circuit is designed and can be expandable to huge scale to produce mass electrical energy for any type of wireless power transmission.

Keywords- Rectenna; parameter; time domain; bandwidth; Design; application

INTRODUCTION

In recent years, Wireless technology and device is more and more demanding due to its more compatibility and portable in nature. The great revolution occurs just starting of 21st century when global system for mobile communication starts its peak. Many types of antennas are optimised in miniaturization and shape compactable to cell phone and telecom network fro range of 890 – 960 MHz From that year cell phone dimension becomes smaller and smaller .Till now also researchers are waiting for smallest size of mobile in this world. The other bandwidth are

digital communication system from 1710MHz to 1880 MHz , the personal communication system from 1850MHz to 1990 MHz) and the universal mobile telecommunication system from 1920MHz to 2170 MHz which becomes essential day by day. Planar antennas are also very eye-catching in telecommunication instruments for wireless local area network systems at resonant frequency of 2.4 GHz which have ranges of 2400MHz – 2484 MHz and resonant frequency of 5.2 GHz which have ranges of 5150MHz– 5350 MHz bands respectively.

Design and analysis

Rectenna antenna model design and analysis

Here, A Rectenna is designed using HFSS and simulated. Figure 1 shows that 4 element array structure on air supported substrate.Figure-2 expresses return loss of the proposed antenna designed. It shows that minimum S11 parameter is at 2.4GHz and another minimum at 2.9 GHz. So this will flexible for designer to choose any of the either point. Figure 3 shows that entire electric field (E) and magnetic field(H) distribution system in all direction.

Rectenna antenna circuit parameter analysis

Now, It is taken model structure and its equivalent circuit parameter in terms of Resistance, capacitance and inductance. The fresh diagram is taken where 50 ohm load and scattering parameter controller placed in a default frequency range shown which is shown in figure -4. To achieve suitable Simulation kind we have to place required component for SP as per figure. In figure 5, padded C & padded l are general capacitors and inductors .but this also give evidence to designers to enter desired spacing, width, and length of the element as per the element. That proposed structure to be used for actual PCB design.

CONCLUSION

From the above experiment we learned about to design a micro strip patch antenna in HFSS (High Frequency Structure Simulator). A 2.4 GHz rectifying antenna elements and its typical array structure is designed, which can adopt numerous power density if applied in different Rectenna array. The capacitance is exchanged by microstrip line in the form of dc pass filter and the diode in the rectifying circuit is joined in order. The energy translation efficiency from RF energy to DC electrical energy reached 80.25% by retaining 20.85 dBm and 3501 ohm resistive load through tedious testing correspondingly. So maximum 18.55 volt of DC output voltage is detected and noted during simulation. The entire circuit is designed and can be expandable to huge scale to produce mass electrical energy for any type of wireless power transmission.

ABSTRACT

In this paper, Measurement, assessment is done for the coverage, capacity and quality of a mobile network. Then its result are measured and optimized. The technique involves of using a mechanical car holding mobile radio network air interface measurement kit that can detect and record a wide variety of the physical and virtual parameters of mobile cellular service in a given geographical area. Drive testing needs a movable transport system outfitted with drive testing measurement kit. The equipment are typically extremely dedicated electronic devices that interface to OEM mobile telephones. This confirms measurements are genuine and comparable to real user experiences. There are three requirement of drive test which can be termed as Network benchmarking, Optimization and troubleshooting, Service quality monitoring. For benchmarking, sophisticated multi-channel tools such as Focus Infocom's DMTS and XGMA, DingLi Communications' Pilot Fleet, Ascom's Symphony, Rohde & Schwarz-SwissQual's Diversity Benchmarker or Keysight Nemo Invex II are used to measure several network technologies and service types simultaneously to very high accuracy, to provide directly comparable information regarding competitive strengths and weaknesses. Results from benchmarking activities, such a comparative coverage analysis or comparative data network speed analysis, are frequently used in marketing campaigns. Drive testing to gather network bench-marking data is the only way mobile network operators can collect accurate competitive data on the true level of their own and their competitor's technical performance and quality levels. Similarly Optimization and troubleshooting diagnoses the root cause of specific, typically localized, network issues such as dropped calls or missing neighbor cell assignments and Service quality monitoring symbolizes the quality of service respectively.

Keywords: UWB system; parameter; time domain; bandwidth; Design; application

INTRODUCTION

This paper consist of 3G drive tests and EMF survey. It contains detailed method of the 3G drive test. It shows how use of the TEMS software for the 3G drive tests done. Drive test is conducted for testing coverage conditions of a cell site with RF drive test tool. The files collected by drive test tool as Log files are studied to evaluate various RF parameters of the network. And it's truly very vital things for mobile service provider. Drive testing help us to measuring and evaluating the coverage, Quality of Service and capacity of mobile system. TEMS Investigation is main tool of drive testing. It consists of both hardware and software. Hardware of TEMS Investigation is a mobile phone. The overall objectives of RF planning and drive test is to examine network health condition whose feedback is customer satisfaction in terms of coverage and capacity in real time.

3G DRIVE TEST

Site Information

Site information consists of site name, site id, latitude, longitude, mechanical tilt, electrical tilt. The drive test engineer is provided with these information before the drive test.

Drive Tools

First tool is a laptop with TEMS software which is an essential part of drive test. Second tool is a mobile with a TEMS license so that it can be detected by TEMS software. Third tool is the GPS (global positioning system) which detects the correct position.

Tools Setup Process

Open the TEMS software in the laptop**.**
Go to Presentation, then click GSM.
In GSM, click current channel shown in fig 3.

Tx Power – It is the transmitting power of the mobile station.
RSSI – It is Received Signal Strength Indicator. It is the total power of the entire common pilot channel received by the mobile station including noise and neighbor interference.
Target SIR – It is the target signal to interference ratio that mobile equipment is supposed to achieve by increasing or decrease its power.

SIR – Signal to interference noise ratio is the ratio of energy in dedicated physical control channel to that of the interference and noise received by the user equipment.
RRC State – It shows the current state i.e. idle or dedicated.
In WCDMA, click Serving/Active Set + Neighbors shown in fig 5.

Scrambling Codes (SC) – They are used to identify different cells of node B. There are two types of scrambling code i.e. primary and secondary scrambling code.
AS (Active Set) – It is the set of scrambling codes on which the user equipment is latched on and there can be at least three maximum scrambling codes in an active set.
MN – It is the neighbor cell detected by the user equipment.
In WCDMA, click Data services and then click HSDPA analysis shown in fig 6.
In WCDMA, click Signaling and then click Events shown in fig .7
In WCDMA, click Positioning and then click GPS shown in fig 8.
In WCDMA, click Positioning and then click map shown in fig 9.

Monitor the drive path through google map.
Then click on the 'Start Recording' and start the drive test.
Observe the parameters of the drive test shown in fig 11.

After the drive test is complete process the log file using TEMS software.
After the processing of log file, open Mapinfo. Professional software.
In Mapinfo. Professional software open the export file and generate the plot of required parameters.

- **Drive Plots**
- **Drive Route Plot**
- **RSCP Plot**

RSCP – It is received signal code power. It is the level of signal received by the user equipment or a specific common pilot channel received by user equipment.

Pilot Best Server Plot
Ec/No Plot

Ec/No – It is the ratio of energy of the chip and the combined power of all the signals including the specific pilot channel. It also shows the level of noise disrupting the specific CPICH.

HSDPA Throughput Plot

EMF SURVEY
Overview
The Effective Isotropic Radiated Power is measured by performing EMF survey across the BSS. Due to this survey, the harmful effect which causes due to huge power radiation can be checked from the tower. As per the customer's requirement, the different parameters are noted and report is prepared which will submitted to operator.

EMF survey tools: GPS, Digital camera, Laser distance meter, Magnetic Compass, Safety kit.

CONCLUSION

In this paper, 3G drive test is processed and each bit is covered. Different parameters are calculated and visualized to prepare a report of log File to reverse updating of GSM network. Here 3G RSCP Plot, pilot best sever plot and Ec/No Plot are improved.

ABSTRACT

In this paper, Difference type of drive test summarized for 4G LTE Network and parameters such as Network benchmarking, Optimization and troubleshooting, Service quality monitoring. For benchmarking, sophisticated multi-channel tools such as Focus Infocom's DMTS and XGMA, DingLi Communications' Pilot Fleet, Ascom's Symphony, Rohde & Schwarz-SwissQual's Diversity Benchmarker or Keysight Nemo Invex II are used to measure several network technologies and service types simultaneously to very high accuracy, to provide directly comparable information regarding competitive strengths and weaknesses. Results from benchmarking activities, such a comparative coverage analysis or comparative data network speed analysis, are frequently used in marketing campaigns. Drive testing to gather network bench-marking data is the only way mobile network operators can collect accurate competitive data on the true level of their own and their competitor's technical performance and quality levels. For Optimization and troubleshooting Optimization and troubleshooting information is more typically used to aid in finding specific problems during the rollout phases of new networks or to observe specific problems reported by consumers during the operational phase of the network lifecycle. In this mode drive testing data is used to diagnose the root cause of specific, typically localized, network issues such as dropped calls or missing neighbor cell assignments. For Service quality monitoring, Service quality monitoring typically involves making test calls across the network to a fixed test unit to assess the relative quality of various services using Mean opinion score (MOS). Quality monitoring focuses on the end user experience of the service, and allows mobile network operators to react to what effectively subjective quality degradations by investigating the technical cause of the problem in time-correlated data collected during the drive test.

Keywords-UWB system; parameter; time domain; bandwidth; Design; application

INTRODUCTION

The paper includes 4G LTE drive tests. It includes detailed procedure of the 4g drive test. It contains the procedure of the 4g drive test and its parameters. It also includes the use of X-CAL software in 4G. Generally Drive test is conducted for checking coverage criteria of a cell site with RF drive test tool. The data collected by drive test tool as Log files are analyzed to evaluate various RF parameters of the network. And it's very important things for mobile service provider. Drive testing help us to measuring and assessing the Quality of Service, coverage and capacity of mobile network. TEMS Investigation is main tool of drive testing. It consists of both hardware and software. Hardware of TEMS Investigation is a mobile phone.

The overall objectives of any RF design depend on a number of factors that are determined by the needs and expectations of the customer and the resources made available to the customer. Analyses made through the information of data collected in the field represent a true picture of network conditions, and can be used in decision making in several areas, from planning and design through optimization and maintenance of the system, always with the goal of maximizing quality, capacity and coverage in the Network.

4G DRIVE TEST

Site Information

Site information consists of site name, site id, Band Type EARFCN. The drive test engineer is provided with these information before the drive test.

Drive Test procedure

The step by step procedure to perform drive test and collect required network parameter data is as follows:
Open XCAL tool on mobile so that the XCAL screen appears as shown below:
Press the setting button on the mobile and select FMS (Fleet Management System) mode.

After selecting FMS mode, there is need to select basic information i.e. band selection on which the network works, and the destination selection on which the drive test performs. Next, press select scenario; after pressing scenario five more fields are to be filled i.e. select SCFT from select type, enter site details for which drive test is performed, select Station 1 from test type (there are three stations and one by one test is perform for all the three stations), select count 1 from cycle option because the test is performed only one time, feed 55555 in dial number option and press save button. Next, press start button to begin SCFT test. A call is established in 55555 number. After 15 seconds the call is automatically disconnected and there appear queries to complete the test or the test is in progress, here option in progress is to be selected.

After pressing in progress the next station is to be selected till all the three stations are covered. After performing test (for station 1, station 2, and station 3) in place of in progress option, complete the test option is selected to complete the station test. Change test type from station1, 2, 3 to moving (the moving test is performed to test the internet speed). Next, select scenario; there are two parameters in select scenario option i.e., DTDL and DTUL. The moving test is performed for both DTDL and DTUL one by one. First the moving test is performed for DTDL, select DTDL from the select scenario option. Next, click to FTP to select the nearest server to perform moving test. Next, press start button to perform moving test for DTDL; in DTDL scenario XCAL tool downloads a video file from the selected server and calculate the downloading speed (maximum, average and minimum). By pressing the Auto call view the downloading performance is checked and also the downloading speed as well as the download throughput graph. Once the file is downloaded from the selected server, the call is stopped automatically and again query appears to complete the test or the test is in progress; select in progress option to perform DTUL test. Next, change scenario from DTDL to DTUL to perform the Data Uplink; again the FTP server is selected, the video file uploads from XCAL

to FTP server and the uplink speed is checked. By pressing the Auto call view the uploading performance is checked and also the uploading speed as well as the upload throughput graph. After completion of the DTUL test, the complete option is selected to complete all the tests.

Drive Plots

CONCLUSION

In this project, 4G drive test is done in various method and EMF survey is done to know the signal strength for a particular area. Especially XCAL software gives good performance in LTE network. The drive root plot shows here clear image of radiation spectrum. Coverage plot (mobility event), MAC layer throughput download, MAC layer throughput upload parameter measured accurately. RSRQ quality plot, SINR quality plot shows comparison of quality survey and result are summarized. Here is another advantage is that modulation down link and uplink plot is drawn to measure the modulation efficiency.

ABSTRACT

Abstract-In this context, Drive testing, its different types are analyzed, results are measured and optimized. Drive testing is a method of measuring and assessing the coverage, capacity and quality of a mobile radio network. The technique consists of using a motor vehicle containing mobile radio network air interface measurement equipment that can detect and record a wide variety of the physical and virtual parameters of mobile cellular service in a given geographical area. Drive testing requires a mobile vehicle outfitted with drive testing measurement equipment. The equipment are usually highly specialized electronic devices that interface to OEM mobile handsets. This ensures measurements are realistic and comparable to actual user experiences. Drive testing can broadly be categorized into three distinct topics named as Network benchmarking, Optimization and troubleshooting, Service quality monitoring.

Keywords: UWB system; parameter; time domain; bandwidth; Design; application

INTRODUCTION

The paper includes 2G drive tests and EMF survey. It includes detailed procedure of the 2G drive test. It shows how we use the TEMS software for the 2G drive tests. Drive test is conducted for checking coverage criteria of a cell site with RF drive test tool. The data collected by drive test tool as Log files are analyzed to evaluate various RF parameters of the network. And it's very important things for mobile service provider. Drive testing help us to measuring and assessing the Quality of Service, coverage and capacity of mobile network. TEMS Investigation is main tool of drive testing. It consists of both hardware and software. Hardware of TEMS Investigation is a mobile phone.

The overall objectives of any RF design depend on a number of factors that are determined by the needs and expectations of the customer and the resources made available to the customer. Analyses made through the information of data collected in the field represent a true picture of network conditions, and can be used in decision making in several areas, from planning and design through optimization and maintenance of the system, always with the goal of maximizing quality, capacity and coverage in the Network.

2G DRIVE TEST

Site Information

Site information consists of site name, site id, latitude, longitude, mechanical tilt, electrical tilt. The drive test engineer is provided with these information before the drive test.

Drive Tools:

First tool is a laptop with TEMS software which is an essential part of drive test. Second tool is a mobile with a TEMS license so that it can be detected by TEMS software. Third tool is the GPS (global positioning system) which detects the correct position.

- **Tools Setup Process:**

Open the TEMS software in the laptop**.**
Go to Presentation, then click GSM.

In GSM, click current channel shown in fig 3.
Time – It is the system time of computer.
Cell name – It displays the name of sector which is serving according to the cell file loaded in the TEMS software.
CGI – It stands for Cell Global Identity which is unique for every sector of the site. It consists of MCC (mobile country code), MNC (mobile network code), LAC (location area code), CI (cell identity).
Cell GPRS Support – It tells sector having GPRS or not.

Band – It tells in which frequency band the mobile is operating.
BCCH ARFCN – It tells by which BCCH is the mobile station getting served.
TCH ARFCN – It tells on which traffic frequency call is going on.
BSIC – It is base station identity code. It is a combination of NCC (network color code) and BCC (base station color code).
Mode – It shows in which state mobile is operating i.e. idle, dedicated & packet.
Channel Type – It shows in which channel the mobile is working.

In GSM, click radio parameters shown in fig 4.
Rx Level – It is the receiving level of the mobile from the site in terms of dBm.
Rx Quality – It is the quality of voice which is measured on basis of BER.
FER – It is Frame Erasure Rate. It represents the percentage of frames being dropped due to high number of non-corrected bit errors in the frame.

In Presentation, click Signaling, then click Events shown in fig 5.
In Presentation, click Positioning, then click GPS shown in fig 6.
In Presentation, click Positioning, then click Map shown in fig 7.
Connect the mobile and gps with the laptop and activate them.
Monitor the drive path through google map.
Then click on the 'Start Recording' and start the drive test.
Observe the parameters of the drive test shown in fig 9.

After the processing of log file, open Mapinfo. Professional software.
In Mapinfo. Professional software open the export file and generate the plot of required parameters.

(a) **Drive Plots**
(b) **Drive Route Plot**
(c) **Rx Level Plot:**
(d) **Rx Quality Plot**

EMF SURVEY

Overview

EMF survey is performed to collect EIRP (Effective Isotropic Radiated Power) ratio to know about the strength of EMF signal across the BSS. This survey is performed to check the harmful effect cause due to high power radiation of the EMF from the tower. Take data of the site i.e. site name, site id, site address, latitude & longitude. Take the tools required for the survey. After the survey the report is made according to the requirement of customers.

EMF survey tools: GPS, Digital camera, Laser distance meter, Magnetic Compass, Safety kit.

EMF survey snaps

Datas collected in EMF survey

Site layout, panoramic photos at 0°, 30°, 60° ……330° respectively, tower height, building height, tower photo, building photo, latitude & longitude of site, GPS photo, antenna height, azimuth, antenna snaps, tower base snap, corner snaps, adjacent building snaps(within 60 meters), adjacent buildings height, number of floors, latitude, longitude & distance, adjacent buildings layout, signage snap.

CONCLUSION

In this article, the detailed procedure of the 2G drive test is learned. Also learn about EMF survey procedures learned. Different parameters of 2G is also learned. Procedure of log file processing in TEMS software is taken and noted. I acquire skill in report making of drive test and EMF survey and learned about different types of reports. It is gained a lot of experience in the field of drive test engineer. Also this is gained some knowledge about the working of mobile towers practically.

ABSTRACT

Recently, educational computer animation has turned out to be one of the most elegant tools for presenting multimedia materials for learners, and its significance in helping to understand and remember information has greatly increased since the advent of powerful graphics-oriented computers.In this paper we have presented a study of various graphic image animation techniques and their probable usage in educational learning.

Keywords: Computer graphics, animation,three dimentional motion data,educational learning, feature database

INTRODUCTION

Animation isn't simply the motion of few characters on screen however it's additionally a good medium to form folks perceive the message, particularly young children. Animation, which is basically a form of pictorial presentation, has become the most prominent feature of technology-based learning environments. It refers to simulated motion pictures showing movement of drawn objects. Looking at the past and the present, animation has evolved over time. It started with pieces of paper and rope in 1828 and is today three-dimentional animation videos.Recent years have seen enormous interest in research on two-dimensional image manipulation.Very powerful solutions have been presented for issues like matting, image complementation, texture synthesis and rigid image handling.If images are manipulated, unavoidable requirements are tools to produce correct division or matt alpha and to complete lack of pictures.

Generating videos by animating objects in still images has countless applications across areas of interest including movie production, photography, and e-commerce. More precisely, image animation refers to the task of automatically synthesizing videos by combining the appearance extracted from a source image with motion patterns derived from a driving video.For instance, a face image of a certain person can be animated following the facial

expressions of another individual. In the literature, most methods tackle this problem by assuming strong priors on the object representation and resorting to computer graphics techniques.

Animation System

An artist faces two challenges when creating a two dimentional animated character to mimic a specific human performance. One is the artist must design and draw a collection of artwork depicting portions of the character in a suitable set of poses, for example thigh and leg poses that can be selected and combined to express the range of movement and muscle flexing typical for that person. Other one is in order to depict a specific performance, the artist must select and position the appropriate set of artwork at each moment of the animation.

Designing the motion of 2D or 3D characters is a critical part of creating animated stories. Relative to traditional keyframe-based workflows, performed animation provides a more convenient way to specify how characters move. Instead of authoring individual frames or specifying motion curves, an actor simply demonstrates the desired movements, which are acquired via video or motion capture and transferred to the character. For most three dimentional characters, the motion transfer is relatively straight forward. Each joint on the actor typically corresponds to a matching joint on the character, which allows the continuous motion of the performer to be mapped directly to the three dimentional character producing convincing, nuanced animations. As a result, performance animation is used for a wide range of three dimentional animation scenarios, from feature films to games to special effects.

Method I

To create convincing animations of a two-dimentional character, its shape has to be deformed in a plausible manner, while maintaining minimal effort to generate animations.The basic idea is to utilize a set of generic form templates T, representing the topological changes of a generalized model of character for a variety of camera viewpoints (Figure 1).The models are designed with a semi-automatic character approach.A model is known as a two nonmanifold dimensional triangle mesh that enables different animated layers to be represented.For example, for animation from a side view, for separately moving parts of the body we must consider different layers, for example one layer for the forearm, one for the body, the fore leg and another for the rest of the arms and leg.In addition, such layers can not move separately but must be "stitched," in order to convey a connected body impression when animated.Thus, a triangulate set of vertices representing the boundary form and skeleton joints for each layer of T template consists of.Each template's different layers are linked by common border vertices.Inside each layer, additional vertices are added, allowing us to make more realistic animations by "inflating" the shape templates before animation.To deform T we employ a form-handling technique as-rigid as-possible (ARAP), on the one hand allowing for flexible deformations of the shap of the character and on the other, preserving the body size and appearance ratios to bind the distortion on the character.

Method II

Measuring the three-dimentionalposition of points on surface of any complex object is a significant problem.Moving every point a small distance in successive frames is to shift the position of object from one to another.The location of each skin point is determined by the interpolation between the previous position of the stage and the next position of the process.By blocking a number of key drawings, the animator specifies the desired motion.He then gives the assistant animators the main drawings which generate the necessary intermediate frames (Figure 2). The key drawings are replaced by data files which describe the object for each of the various poses.As the motion is non linear, to estimate the acceleration and deceleration of facial movements, a cosine interpolation scheme can be used. Each frame has a phase number associated with it. This phase number is a real number whose integer part refers to the preceding phase and whose fractional part indicates the location of this step between the preceding and the next step.The following algorithm is used to measure every part of a Point position:

Current position = position in the previous phase +C * difference wheredifference = position in next phase - position in previous phase C =(1.0 – cos (Φ)) / 2.0and Φ = phase fraction * 3.14159

Animation Program Algorithm

Step 1: The animation program contains topology and phase data arrays.In the program up to three passes may be stored.In data files the topology and phase data are read in.The program user interacts with it to specify which data files it wishes to read in.
Step 2: Phased datafiles are data for a point set.Each point has a point number and a three-dimensional position.Topology data is a specification for every object poygon.The polygon specification consists of the polygon vertices and their color.
Step 3: After reading in the desired data, ither half of the object data is constructed by mirroring or reflecting data for the first half of the object.
Step 4: For each frame of a sequence, a number of tasks must be accomplished to calculate the data needed to pass to the hidden surface and shading algorithm.
Step 5: The software interpolates the phase data to obtain the location of each vertex in the skin for this structure using the phase number assigned to each container.
Step 6: These points are specified in a system centered in the coordinates.The surface hidden algorithm will require data in a separate coordinate system to be specified.We want to take a look into the position of the new coordinate system , known as the viewing system.The Z axis of the display system should show the direction that we want to look at. This new coordinate system must convey position data.The animation program translates the data so that the source moves from the center to the position from which we want to look.The coordination mechanism then rotates such that the Z-axis of the viewing mechanism points to the position we want to see.
Step 7: The usual to each polygon is determined after the data are transferred into the viewing device.The normal at each skin vertex is determined using these normals.For each vertex, this is achieved with the average of the rising standard polygons of the vertex.
Step 8: For each frame, following parameter are passed on to hidden surface and shading algorithm:

1. The Viewing angle
2. The color of each polygon
3. The position of beginning and ending point of each edge of each polygon and the normals at these points.
4. The desired resolution.

OBSERVATION AND CONCLUSION

Animated sequence can be recorded using animation camera. Film advance and shutter to be under program control. Designing educational materials with the aid of the mentioned technique, while considering the types of temperament of students, is a really promising avenue to improve the learning process. Teachers will be able to feel more confident in the presentation of their lessons, in addition, they will become more competitive and professional. An analysis ofthe system for animating two-dimentional images of arbitrary characters with three-dimentional motion has been presented. It has been shown here that the simple user interaction, namely the selection of some two-dimestable joints, can be used to automatically reconstruct a geometrically plausible calibration of the camera and model from motion data.Forms deformation algorithm, able to deform the form in a more accurate way so that a wide variety of characters from various three-dimention motion dates can be generated by still frames and animations.With this could integrate global effects like shadows or reflections to improve the visual appearance.This study also has a high probability of broad educational benefits.

ABSTRACT

This paper describes simulation study of a printed microstrip slot antenna.It is a quarter wavelength monopole slot cut in the edge of the finite ground plane and fed by a microstrip transmission cable.It provides a broad impedance bandwidth customizable by variance of its parameters such as relative permittivity and substrate thickness, width and position of the slot in the ground plane, and measurements of the feed and ground plane.The ground plane is thin, 20 mm × 10 mm, around the size less than of a Laptop wireless card.At the center frequency of 5.5 GHz, its 50 mm width is about $\pi/2$ and significantly affects slot impedance and bandwidth.An impedance bandwidth of up to 70% (S11 = -10 dB) is achieved by individually optimizing parameters.

Keywords: Microstrip slot antenna, finite ground plane, microstrip feed line, monopole, wide band width.

INTRODUCTION

Merging wireless communications applications require challenging antenna features.Some of these applications include local multipoint fixed wideband communication services, while others address small mobile units such as cell phones or other handheld units, laptops and various remote sensing devices.Most technologies need miniaturization.The need to increase information transfer also requires bandwidth enhancement, without sacrificing performance.These requirements, put together, provide a challenging list of specifications requiring antenna design innovation beyond known conventional techniques [1-2].Miniaturization of antenna for mobile phones, PC cards and wireless personal digital assistants (PDAs) is also of interest[3].A slot antenna is important for such applications because of its simple structure.If a microstrip slot antenna is fed with a microstrip thread, it does not add weight and size to the device and is appropriate for these applications [1-3].Consequently, much attention has been paid in the past to analyzing narrow-width rectangular microstrip slot antennas fed using a microstrip line [1],[4],[5].The authors presented the design of printed square slot antennas fed by a microstrip line with a fork-like tuning stub to enhance bandwidth.Simulation results for low-profile, wide-band quarter wavelength microstrip monopole slot

antennas fed on a finite ground plane are shown in [7-8]. A diversity antenna with two feed ports was recorded using a monopoly and socket, where a quarter wavelength channel antenna is combined with a quarter wavelength monopoly [9].

In this paper, we present simulation and experimental traces of a printed microstrip slot antenna fed by a microstrip line.The antenna is a quarter wavelength monopole slot, cut in the edge of the finite ground plane and fed by a microstrip transmission line.Because the ground plane is rectangular, two different slot locations are possible along the long and shorter edges of the ground plane.For the former case, Section II examines the problem in detail. It has different design parameters for optimization.The effect of individual slot performance parameters is investigated.These investigations provided adequate information to understand slot antenna characteristics on a small, finite ground plane.Therefore, to have polarization flexibility, the second orthogonal slot case was not analyzed in depth, but instead in tandem with the first.Section III presents the results. These slot antennas can be easily integrated with planar circuits and electronics using their ground plane conductor.The simulations were performed using a "High Frequency Structure Simulator" HFSS 17.0 finite element system (FEM) software.

GEOMETRY AND PARAMETRIC STUDY

The antenna is a straight slot cut on the ground, as shown in Fig. 1and fed a 50 microstrip transmission line electromagnetically.Table 1, which has been selected after many simulations, provides its initial design parameters.Its length is 7.2 mm Sl and its design frequency at 5.5 GHz is a quarter-free wavelength.And it is a slot antenna of the monopoly.For the parametric study the most sensitive parameters were Sw, Sp, Gw and Fl. Fig.2. Microstrip slot antenna design using HFSS The remaining parameters showed no significant impact on impedance bandwidth and were kept invariant throughout.For a correct understanding, only one parameter at a time was different, while others were maintained constantly.This reduces the operating frequency by increasing the slot width, which increases the slot zone.Therefore, this parameter can be used to reduce the slot size relative to the wavelength.The minimum frequency S11 is not Gw-sensitive.Once again, the best impedance match frequency is reduced by increasing the relative dielectric constant, which can be used for slot size reduction. The impedance bandwidth can be increased by varying the substrate thickness. The best frequency matching impedance remains practically constant with increasing feedline length. Thus, the feedline length variation modifies its impedance transformation ratio and compensates the slot impedance variation with frequency, increasing its bandwidth.

The parametric analysis above showed the effect and action of each parameter on the bandwidth of the antenna impedance.The results can be useful in selecting optimum variable parameters when certain others are constant due to design and manufacturing constraints.Due to multiple parameters, however, individually optimized parameters will not result in optimum antenna design.On the other hand, as all optimized cases provided peak bandwidths between 35–40%, the selection of individually optimized parameters for a prototype antenna should do the same or better.The antenna impedance's sensitivity to substrate height is a practical concern and was investigated for the above antenna.Increasing the substrate thickness actually increased the bandwidth. The increased substrate height basically increases the slot antenna 's electrical dimensions, which in turn provides increased bandwidth.At the lowest frequency of 5.5 GHz, this range is about a quarter wavelength and around.Hence, its variable impedance transformation is much more efficient and further improves slot impedance bandwidth.This feedline impedance transformation appears to be the most effective bandwidth parameter.

Simulations Results

The return loss, radiation patterns, 3D plot of the single slot antenna have been simulated.However, due to their asymmetric locations on the ground plane when dual slots are there, their radiation patterns are not exactly

similar.This can be corrected or improved in practice by selecting alternative and symmetric locations, depending on the substrate circuit configuration.

CONCLUSION

Printed microstrip slot antennas were investigated in this article, showing variable and large impedance bandwidths, achievable by varying the specific parameters.This antenna can find wireless communication applications where simple wideband and compact polarization diversity antennas are desired.A microstrip slot antenna was also studied and showedwide impedance bandwidths and potential for polarization diversity applications.

ABSTRACT

This paper includes an analysis of the key techniques used in the construction of microwave filters.The foundation of much of a basic microwave-filter theory has been demonstrated in the field of lumped-element filters, in fact used directly for many applications at microwave frequencies up to 18 GHz.Many types of Microwave Filters are addressed, particularly for beginners to the field, with the objective of finding the most useful references.

Keywords: Bandpass, comb line, diplexers, filters, hairpin line, high-pass, low-pass, lumped element, microstrip, microwave, multiplexers, parallel coupled line, planar, strip line.

INTRODUCTION

Since the previous study reported in the 1984 Special Centennial Issue of this transaction [1], major changes have been identified.Since the previous study reported in the 1984 Special Centennial Issue of this transaction[1], major changes have been identified.Lumped-element filters are now used at a frequency of around 18 GHz and represent a significant percentage of the industry's generated microwave filters.The unloadable Q depends on frequency, but on average approximately 200, and can be obtained by values greater than 800 at lesser frequencies, e.g. 170 MHz[2].Such statistics favorably compare to the microstrip, and the cost of production is very small.Naturally, measurements are slightly smaller than distributed filters, a substantial benefit.The use of larger distributed filters cannot be avoided, however, unless installation failure and likely power supply are of significant concern.It is used technology.

The study of lumped-element filters is important academically as an essential part of understanding distributed filters, which largely rely on lumped-element theory.Therefore, a lumped element low-pass prototype filter begins to develop many or even most of the filter designs and the concepts of susceptibility slope and connection coefficients unify the theories (see Section III).Filters may be classified into several different categories and defined by the positioning of the insertion-loss-function poles and zeros in the passband in different classes of response

functions.The nulls are usually spaced throughout the passband for a rubbish or Chebyshev reaction, as the optimal reaction is far better than the flat or rare reaction of Butterworth.For poles, this type of filter response is the most frequent type at dc or infinity and is often described as a Chebyshev-all-pole filter or as a Chebyshev-filter simply.

When at finite frequencies one or more poles is incorporated into the channels, the filter is called a general Chebyshev filter or pseudo elliptical filter.The well-known elliptical function filter is the special case where the maximum number of poles are located at the end frequencies so that the stop bands have the same degradation level.This is rarely used because it has practical problems and is not ideal when specific stopbands are needed you rarely have to reject them until they are nevertheless frequent.The poles where they are most needed are nearly always better placed, as each additional finite frequency poles can increase complexity and expense.This discussion also covers the main filter categories defined by general reaction types such as low-pass, bandpass, high-passenger and band stops.For band stop filters, the poles are situated in the stop area and the zeros are positioned elsewhere, as normally created by means of a transformation of the low-pass band-to - band frequency stops.The topic of lumped element (LC) filters for service at microwave frequencies was fairly scarce in literature.This may seem surprising given the core role of LC filter theory, but textbooks do not go beyond the most basic stage of design, i.e. the application of low-pass transformations to band-passes.

The problem here is that when the narrow ribbon is set, the resulting filters become unrealizable due to the resulting large distribution of element values.Lose external coupling networks are required to transform impedances and implement impedance inverters and/or transform network work.The aim of this is to reach designs that usually have similar value for a mid-band reactance of 40 to 100, either in series or in a shunt or in numerous designs, series and shunt.This is the same state as the coaxial filter design, which indicates one of the few parallels between LC and tributed filter design.Some of these are described in the 1980s, the Microwave Journal published two papers [3] [4].Some of the design principles are shortly outlined, but for a more complete understanding many details are required.Either commercially available design programs are very lourd and require several arcane network transformation programs to produce feasible filters or lack the basic capacity.Interestingly, the fundamental 1957 paper by Cohn[5] gives one of the keys to a satisfactory design.

The paper describes LC filters with equal inductances and all-shunt resonators.This is, however, a little bit limited because all but one of the poles is at dc, and more general filters are needed as stated in [3] and [4].One way to do this is to position the required number of pole at dc and infinity using exact synthesis, which has the advantages of accuracy and no bandwidth limitations resulting from approximation.The best technique for synthesizing these methods is through the transformed variable that Orchard and Temes describe [6].Although this is not an easy subject, the techniques deserve to be acquired.Wenzel has provided a much simpler paper describing applications for the design of distributed filters [7], which must be studied first.[7] is almost similar with the techniques defined for LC filter syntheses, the distinction being that a simple transformation is initiallyused [1, Sec.].Moreover, [7] introduces the measurement line unit or cascading section required for distributed filters and which is not counter-part in LC filters. Exact synthesis also to best suit pseudo elliptical filters.One procedure is to synthesize a low-pass prototype, then a band-pass filter resonates.Network transformers are used to connect to, for example, serial condensers, as well as to introduce redundant LC-Element shunt when needed to remove "floating nodes." In some cases, the band pass filter can be synthesized directly without the low-pass prototype stage, such as when the poles are asymmetrically related to the passband, e.g. when thermocouples are asymmetrical. Further discussion is presented in Section III, with a particular reference to cascading-quadruplete filters (CQ) and cascaded-trisection (CT) filters [10], [11],[39], and this may be the basis for cross-connection filters between non-adjacent resonator filters.

UNLOADED QinMICROWAVEin LUMPED-ELEMENT RESONATORS

Returning to the issue of unloaded Q, the definition of that for the series LC resonator shown in Fig. 1. Isinstructive to consider.The resonator loss is caused by the resistance R.If the current in the resonant frequency is I, the value of the unloaded Q is defined as the ratio of the inductor reactance to series resistance, i.e.

$$Q = \frac{\omega L}{R} = \frac{\omega \frac{1}{2} LI^2}{\frac{1}{2} RI^2} \quad (1)$$

Similar results apply to a shunt resonator.In either case (series and shunt), the energies contained in the magnetic and electric fields are equal at resonance.We note that (1) for any resonator form, whether lumped or distributed, the concept of unloaded Q is precisely that.In fact, it is not even necessary to distinguish between the two since the Q of an LC resonator is determined primarily by that of the inductor and its Q depends on the ratio of its volume to surface area as in any electromagnetic resonator of the cavity.It has been established that a relationship of the form gives the Q of any normal (non-superconductive) metallic RF cavity.

$$Q = Kb\sqrt{f} \quad (2)$$

where b is a linear dimension of the cavity, fis the resonant frequency, and *K*is usually constant for any given type of resonator. It is noteworthy that a number of TEM resonators differ within a relatively narrow range, including lumped components, microstrip, strip line, and coaxial lines.It is normal in the U.S. to use units of inches for and gigahertz for f, and is then of order 1500–3600 for the different cavities, described differently as the mean diameter of the coil for LC resonators, the thickness of the substratum for microstrip, the ground plane spacing for strip line, and the outer diameter of coaxial line.

These figures relate to practical Q values for copper or silver rather than the theoretical values that are almost impossible to realize due to surface imperfections, and a de-rating factor of 0.7 was incorporated into any theoretical calculations.In the case of waveguides, the relationship between Q and dimensions is more complex than the simple equation (2),al-though the Q retains the same type of proportionality between frequency and linear dimension.For a given volume, however, the effective value is much higher than for TEM resonator cases.Later, in Section III-A, the value of a comb line filter increases as the ground-level spacing increases to an appreciable fraction of a wavelength, enabling the propagation of waveguide modes, leading to higher Q than predicted from standard TEM-type resonators.HFSS microwave filter design and simulation results are shown in Fig. 2 and Fig. 3.

TYPES OF MICROWAVEFILTERSANDDESIGN INFORMATION

This section describes the various types of distributed filters, where the different types may be used, as well as the key sources of design knowledge.These categories are comb line, interdigital, parallel-coupled-line band pass, band stop, ring and patch filters, and stepped-impedance filters.Several implementing media include waveguide, dielectric resonators, coaxial lines, evanescent filters and various printed microstrip, strip line and suspended substrates.Acoustic filters are beginning to make inroads into the market for high-volume miniature filters, typically used in wireless telephones, and details about microwave acoustics are found in this paper.Superconducting filters also come into vogue when the ultimate in performance is required, i.e. exploiting the extremely high unloaded Q due to virtual elimination of resistive losses.In some cases, the references cited may not be the earliest invention, but a more convenient or simpler description.Distributed filter design theories are similar to those for LC filters and are based on either exact synthesis or narrow-band approximation.The latter is briefly summarized in [8, pp. 432–433].The important concepts here are the definition of the coupling coefficients between resonators and between the

source and load resistors and end resonators, as well as a shunt resonator's susceptance slope parameter, which can be of any type, lumped or distributed,i.e.

Susceptance slope parameter = $b = \frac{\omega}{2}\frac{dB}{d\omega}|_{\omega=\omega_0}$ (3)

Where*B* is the susceptance of the resonator, e.g., for a lumped resonator

$$B = \omega C - 1/\omega L \quad (4)$$

After applying condition $\omega_0 = \frac{1}{\sqrt{LC}}$ gives $b = \omega_0 C$ (5)

For a quarter-wave short-circuited transmission line of characteristic admittance and electrical length

$$Y = B\tan\theta$$

$$b = Y\frac{\theta_0}{2} = Y\frac{\pi}{4} \quad (6)$$

Narrow-band filter designs for simple Chebyshev response are performed by forming the appropriate parameter of the susceptibility slope, and then replacing the formulas given in [8].Filters made up of resonators from the series are less common.They are merely the dual case of the shunt, and are also treated in [8].In the case of pseudo-elliptic filters, designs may be performed by deriving an appropriate low-pass prototype, followed by a low-pass transformation to bandpass (or band stop, or high-pass) and applying the same method of susceptance slope.Typically, a shunt LC "tank" circuit connected in series produces the finite frequency poles.In some cases, this can be done directly, obviously in the case of lumped filters, and by using a coupling condenser in the case of a comb line resonator, e.g., as in [9].However, by transforming the circuit into one that requires cross-coupling between non-adjacent resonators, as stated in [10], [11] and [39], it is more common to produce finite frequency poles.

Combline Filters

These are the most common types of coaxial filters at least for frequencies below 10 GHz because capacitive resonator loading results in a useful cut in size compared to the ones based on a four-wave resonance.They consist of an array of parallel resonators at one end with a loading capacitor at the other end.The resonators are positioned to make the short circuits all on one side of the filter and the capacitors on the other side.Here, redundant unit elements are added at the input and output ports to give a realizable internal impedance standard, and network transformations are implemented to give the transformers self and mutual admittance, giving functional physical measurements.However, such transformers are now rarely used in industry as they are somewhat inconvenient mechanically, and also increase filter length.Direct tapping of end resonators is more common, as described, for example, in [13].The main problem with this form of coupling is that it is inappropriate when the point is close to the shorter end of the resonator, as with narrow bandwidths at high frequencies, as it is then difficult to control.

Then using some form of magnetic loop coupling, which can be modified externally, is a good alternative.Another often very useful external coupling technique is to use "same-sided transformers"[14], which look like extra resonators at each end of the filter, as shown in Fig. 4(b) but have an impedance transformer position and do not contribute to the filter's insertion-loss function.Compared to direct tapping, the filter is lengthened, but this may not always be a problem, especially at high frequencies where dimensions are small, giving a robust coupling technique.Such filters also have a wide tuning range, with no coupling adjustments and little bandwidth change [14].The asymmetry of the insertion loss on the low-frequency side, especially with large bandwidths, is a drawback to combined filters.Sometimes it is possible to introduce an attenuation pole on the low side of the passband, but this can be difficult with wide bandwidth filters due to dispersion effects-the cross-coupling capacity has a linear

frequency dependence and the couplings between resonators are large , making cross-coupling between non-adjacent resonators mechanically difficult.

Other distributed filter types may be preferred.When ground-plane spacing is an appreciable fraction of a mid-band wavelength, waveguide modes become the predominant type of coupling, and the filter can no longer be considered a mere TEM line structure, but rather an evanescent waveguide filter (see[15] and Section III-H of this paper).This type of filter is very good with unloaded Q and is widely used in the base stations of telecommunications, particularly in pseudo-elliptical with cross-cutting, for optimal answering functions.Here, the rejection of the simple Chebyshev combline filter has better symmetry compared to the combline filters of smaller ground-levelspacing[15] since propagating waveguide filters have steeper rejection on the lower side of the passband, the opposite of combline filters.The "transitional" filter[15] is somewhere between these two extremes.

Interdigital Filters

These consist of quarter-wavelength parallels or 90 parallel couplings, which alternate between short and open ends as seen in Fig 5. The two are parallel-couplings.The equivalent circuit is an electrically separated cascade of shunt-short stubs and the electric length of the line can be a complete 90 unlike full-flow filters.In practice, the lines are shorter, because the fringing capacities are unavoidable, and it is advantageous in some cases that lines are shortened to 60, in order to achieve smaller filters with broader upper refusal bands, which can be compared with the one obtained with flash filters [7].They have looser inter-resonator couplings compared with comblinefilters, i.e.,the gaps between resonatorbars may belarger and, hence, simpler to produceathighfrequencies and wide bandwidths where dimensions become quite small. Inter- digitalfilters have been designed for suchbroad band widths and highfrequenciesas8–18,20–28,and28–40GHz,withupto23 resonators. Note that, when very broad bandwidths are specified, it is then difficult in practice (but not in theory) toachieve a return loss of better than 15 dB or so (0.15-dB

Parallel-Coupled, Hairpin-Line, Patch, and RingFilters

The original type of parallel line filters as shown in the Fig. 6. They are mostly done in microtrips or sometimes strip lines with higher microwave frequencies, as excessive duration in low loss airline situations prevents their economic application.The different phase velocities between even and odd modes in combined lines regions need to be taken into account in microstrips.Several papers on this subject, but few seem to indicate simple and work-saving design procedures.The indexes of previous issues in this article are referred to as "microstrip filters," with one of the simpler procedures given in [17], and further discussion in [18] and [19]. An extraordinarily important advance in microwave filters since the 1984 survey [1] is the development of ceramic resonator filters of the two main types:

- Resonator ceramic or "puck" filters.
- Dielectric-resonator filters in TEM-mode coaxial cavity.

The initial form theory has actually been defined very early, for example in [27]; however, the implementation has been delayed for several years due to a lack of adequate dielectric sealants with good temperature stability.They had been established and were commonly available in the 1980s[28] in many establishments.First-type ceramic resonator filters have a very small loss and greatly reduce the size of traditional waveguide filters.They can be single or double mode [29], but recent preference is to use single mode designs, given better stability in temperature and a slightly improved performance.

Suspended Substrate Stripline (SSS)Designs

SSS was first described by Rooney and Underkoefler[31] and proved important for the design of comparatively low-loss, high-band filters and multiplexers.It is highly suited for designing low-and high-pass pseudo-elliptic filters.An

accurate description of the techniques can be found in[1], and maybe the only subsequent paper to be included in the field is[19].This is apart from the considerable work on micromachined filters that use SSS in the form of a very thin membrane, a topic that is covered elsewhere in this TRANSACTIONS.

WaveguideFilters

The fundamental paper in this article is the well-known 1957 Cohn[5] paper, which is suitable for rectangular narrow bandwidth filters.If broader filters are required, more precise theories should be used as described in [1].Usually, a high-pass filter in waveguide is better configured as a broadband bandpass filter where the upper stopband is above the ideal operating band and is sometimes almost non-existent.Overall, this results in a shorter and lower loss filter that relies on the waveguide's cut-off frequency.Reference[1] also describes dual-mode wave-guide filters widely used in satellites and some terrestrial systems.Triple-mode filters are mentioned, but over-specialized programs are typically too complex.The main problem is the difficulty of tuning and, like dual-mode filters, the inability to tune such filters over even a narrow tuning range.

Coaxial Low-PassFilters

The very same, lumped and distributed mixed theory given in [33], which ensures good filter efficiency throughout the whole operating strip, extending up to the off frequency, is a more satisfactory technique for the system.The same theory may apply in all medium filters, such as coaxial line, stripline, microstrip, SSS, coplanary waveguide. The following may be used.

Evanescent-ModeFilters

The assumption that coupling between the nearest neighboring lines can be ignored is common when designing complete or interdigital filters.In the case of configurations in which the distance of the ground plane at the midband frequency is greater than 300 and where bandwidth is less than 1.5 (condition for the most common width-filter), spacing cannot be regarded as TEM anymore. (These are three hundred and six hundreds of them represent one free-space wavelength at midband).

CONCLUSIONS

In general, the subject of filters and microwave filters in particular is large, and at least one textbook has been generated for more than 1000 pages[8].The purpose of this paper is hopefully to simplify the entry points for field newcomers and show how the theory can be unified.Substantial filtering fields, such as tunable filters and active filter features, have not been discussed here, which can be considered as specialist topics and much less basic.The study of lumped-element filters has been shown to be a sound basis for understanding microwave filters, but in doing so, it is necessary to overcome standard textbook presentations restrictions and delve more deeply into the literature.Another important aspect of filter theory relates to its use in the construction of various kinds of liability elements, such as directional couplers, power divisors and phase shifters, subjects discussed elsewhere.

ABSTRACT

This paper is designed for the development of a multi-level security system to control the theft of a vehicle using GSM and biometrics. The main objective of this paper is to offer and advance security system in multiple levels to protect the car or any vehicle from unauthorized access using smart Technology. It provides real-time biometric user authentication to start the ignition. If the fingerprint does not match with that in the database, ARM produces the interrupt signal to initiate the alarm and also informs the car owner/authorized person about the unauthorized access via short message service (SMS) employingthe GSM modem. Further, GPS will be activated for tracking the action of the vehicle, at the same time the location-related information is sent to the user mobile phone.

Keywords: LPC2148, Fingerprint Sensor, Vehicle Security

INTRODUCTION

Automobiles are an asset in this ever-growing, fast-moving and insecure world. The fear of losing the asset in context has triggered the instinct of developing security systems to protect it from thievery. Many techniques have come forward to implement the security for the automobiles we dear so much. Researchers have used GPS modules implanted in their vehicles to enable the tracking feature. Even its used alongside a GSM module that sends the location of the vehicle on regular basis to inform the owner regarding the current location of the automobile. So the purpose of this article is to design a multi-level secured system to get rid of the anxiety of losing ones vehicle.

The purpose of this paper is to design a security model that would prevent the stealing of our vehicles. This article proposes the use of Biometric module to authenticate the access to vehicles, GPS module to continously track the

vehicle location, GSM module to intimate the vehicle owner the location. The proposed system utilises the above mentioned modules through a powerful and fast processor the "LPC2148" from the ARM 7 family. The processor is the heart and brain of the security module, it distinguishes the person accessing the vehicle is authorised or not. If not authorised necessary preventive steps are taken as programmed, else it continues normal sub-routines. Upon detection of unauthentic access it would start sending panic messages with location coordinates to the owner for tracking and recovering.

LITERATURE REVIEW

The foundation study reveals a number of proposed system that uses GSM and GPS based vehicle location and tracking system. The systems in question utilise the real-time tracking through the GPS satellites orbiting the Earth. The system uses geographic position and time information from the Global Positioning Satellites. Varieties of the anti-theft system have been proposed by different authors by using different technologies. This type of system consists of multilayer protection of the vehicle. The multilayer is as follows, 1) by using the fingerprint module [7], a key recognition system based on which doors are opened and closed, 2) Vibration sensors are used to protect the glasses, as soon as theft tries to break the glasses, it gives the buzz sound, 3) GPS tracker is installed in the car to track the exact location of the car and 4) GSM is used to send message to the owner of the car [4]. All the above four different technologies are interfaced with the ARM 7, which acts as a controlling unit [1][5]. In another literature survey, it has been found that they have incorporated the Biometric and RFID technology [2][6] for vehicle protection and authentication.

They have used a LabVIEW platform to test and validate the process [3]. Next-generation focus on IoT based security system by using Raspberry pi as the main Controlling unit and a WiFi [8]. The advantage of this type of system is that the car owner can seek surveillance from anywhere in the world. Another IoT based VAT is designed using Arduino and periodically the data is stored in the IoT cloud [10]. One survey found that there is a low-cost anti-theft system that uses only the mobile phone and no other devices [9]. The number of hardware I have gathered from previous journals and other sites is given below. All these are used together and worked according to our requirements.

PROPOSED METHODOLOGY

A multi-level control system of a vehicle includes a high level of security by restricting unauthorized users. It allows the user and makes him authorized whose fingerprint is enrolled in it. In case, any unauthorized user enters the vehicle, the Buzzer starts buzzing continuously and it uses GPS tracker to track the location of the vehicle and sends the whole information through GSM Module to the owner.

The flow of control starts from the top. Firstly, the user will be asked to place his finger. If the fingerprint matches the database enrolled into it then the vehicle door opens and if the fingerprint fails to match, the Buzzer starts buzzing and the GPS Tracker gets activated that sends the location of the unauthorized user continuously through GSM Module. Here, the Fingerprint sensor is connected to the LPC2148 ARM7 Board (using COM 0). GPS and GSM are interfaced with LPC2148 (using COM 1). LCD is interfaced with LPC2148 which is used for displaying purpose.The buzzer is connected to Pin0.23 and Relay Board is connected to Pin1.16 of the LPC2148.

Hardware & Software Description

The prototype model described in this paper focuses on many hardware and software parts. If we put together it forms the Embedded System. The embedded system comprises a main processing unit that has inbuilt memory to store code and peripheral devices like Fingerprint module, GPS Tracker, GSM Module, LCD to display information. Figure 3 shows the interfacing of LCD with an LP2148 ARM-based microcontroller. The LCD used in this model is 16 columns, 2 rows which can display 32 alphanumeric characters in two rows. Figure 4 shows the interfacing GPS

module with the main controlling unit with the help of the UART Port. UART port has two pins through which it sends and receives data.The system has an "onboard module that resides in the vehicle to be tracked and a "Base Station" that monitors data from the various vehicles.

The On-Board module consists of a GPS receiver, a GSM modem.Figure 5 shows the interfacing GSM with LPC2148 Microcontroller with the help of the TXD and RDX pin. These pins are universal serial communications pins through which data can be transferred from one device to another.The fingerprint module is interfaced and an application is used to new fingers of the users. This application may be useful for the enrolment and deletion of users. The SFG application for fingerprint enrolment is very simple to use. Finally, after the interfacing is successfully established the programmer need to go for the program implementation. We can see GPS, GSM, and fingerprint modules all are interfaced with the help of the UART protocol. The programmer has to use an IDE i.e. Integrated Development Environment which helps in editing, debugging, compiling the code. So the IDE used does the cross-compilation. It has an option to select the board which is to be used for prototyping development. For this model, we have used the LPC2148 development board, which has 2 input-output ports of 32 bit each. It has many features thatare supported by UART, SPI, I2C, USB 2.0, VIC, WDT, Timers/ Counters, Interrupts. So out of all the features listed above, used only UART and Interrupts to work with all the peripheral devices.

Hence Keil uVision 5 IDE is used to write the code. Once the code has been written and tested and made bug free, a hex file has been created using the IDE. There is another application used to upload the hex file into the target hardware. This application is known as Flash Magic. All the applications discussed above must be installed on the laptop or desktop and with a USB to UART cable the hex file is to be uploaded into the LPC2148 Microcontroller. Finally, in a single environment, we can test, verify, and optimize the application code. The whole prototype model is powered up with an external power supply.

1. Experimental Simulations

The prototype model and its simulation are divided into two parts. The first part deals with the authorized user and the second part deals with the unauthorized users.

Part 1: Authorized user:

In this case, the fingerprint is enrolled in the fingerprint module and when the user enrolls his/ her finger into it then the door of the vehicle opens and it shows "DOOR OPENS" in LCD shown in figure 6(a) and 6(b).

Part 2: Unauthorized User:

In this case, the fingerprint is not enrolled in the fingerprint module. So, if an unauthorized user tries continuously to open the vehicle door and puts his/ her finger into the module shown in figure 7(a) and 7(b). After 3 unsuccessful trials, the buzzer starts buzzing continuously and the GPS Tracker gets activated. It starts sending the location of the motion of the vehicle continuously and sends it to the registered Mobile number. (Owner's number). The Owner can find out the location by clicking on the link and choosing browse option which is shown in figure 8(a) and if he clicks on the link provided to the registered mobile number than it showed the exact location in the google map shown in figure 9. The browsing option will lead the owner into the Map and will navigate the whole motion of the vehicle. Figure 10 shows the complete hardware setup

CONCLUSIONS

The Biometric identification reinforces the vehicle security system by giving acces to selective authorised persons only. This system will enable only the authorised person to access the vehicle. In future the information can be directly sent to the police department along with a copy to the registerd owner. Tracking of the system through GPS has made the tracking system stronger. This security system along side the conventional Lock and Key is a reinforcement of security to avoid losing the vehicle.

ABSTRACT

Marketing in malls and super market has its own advantages and dis-advantages. Advantages being able to choose as per will without constraints, getting the commodity immediately on payment etc. Dis-advantages being standing in a queue to make payments, have to carry the commodity in person etc. in this proposed model the billing process is simplified by completing the item scanning part of the task in the marketing basket itself. The payment can be done online through a reference number at the exit or may be done through portable swiping machine or even directly through mobile banking facility. This becomes more convinient for the customer and economic for the shopkeeper. Thus the goal of the article is very focused on reducing the waiting time during check out and ensuring customer comfort and satisfaction by cutting short the process of barcode scanning at the billing counter.

Keywords: market, economic, barcode, payment, customer.

INTRODUCTION

We see these days RFIDs are widespread and taking a role in many advanced projects due to its fast and effective response. RFID are general tags that are used for the unique identification of products by using radio waves. These RFIDs offer more advantages over conventional Barcodes as they have a major drawback which is Line of sight technology and also these barcode tags have constraints in its durability whereas the RFID tags are more durable and able to read/write data which could even be encrypted. These tags could hold plenty of data like product name, price, size, weight, and other information using their identification number. By implementing this RFID technology for a unique representation of each product in a market shopping is done more easily. This could be done by having a Shopping basket installed with an RFID reader to scan each product and load it which is controlled by a

microcontroller. When the customer is done shopping, they can pay by using ATM cards or by cash at the counters. Our concept satiates the expectation of customers whose basic demand is to ease the way of purchase. By regulating the RFID based shopping basket, one could easily bill the products themselves without bothering the presence of workers in the shop as details of products are readily available and displayed on the customer mobile phone. This outcome of the project will not only facilitate the customers but also the shop owners by eliminating the scanners and money spent on them.The controlling unit of this project is ARM7 LPC2129. The other components areinterfaced to the microcontroller. The components connected to the microcontroller areone RFID module, one GSM module. This project enables the customer to scan theproducts using RFID tags while placing them in the basket itself and when finishedshopping the customer can avail the bill in the mobile phone and pay the amount in thecounter directly. This project helps in reducing the queue in supermarkets and also savestime as scanning won't be done so the customer can directly pay and checkout.

LITERATURE REVIEW

Here we will cover the literature survey where various authors have done much work with the help of different technologies and a different controlling unit. Whenever shopping word comes in the individual mind, they spend more time as compared to the normal time in the shopping complex. This is because for buying any product we have to spend more time nearer to that area because of selecting a particular product. After selection process overs, then we have to move forward to the billing counter which again takes more time. Because no single person is standing in the queue, there are a lot many people standing in a queue which again takes more time. So to overcome these different technologies has been adapted in the shopping complex, such as RFID and Barcode.

Traditionally shopping complex uses barcode for the product and inventory tracking. RFID is replacing the barcode technologies because RFID is faster, with no requirement of the line of sight, it has both read and write capabilities, higher security [8]. As per the advantages RFID is used everywhere. Along with the RFID technology some others have used the Wi-Fi modules to send the billing information where a receipt is generated for the buyer using PIC microcontroller [9]. In [1] authors reveals that a system has been implemented to reduce the time required while shopping. This model is based on Raspberry Pi with Pi Cam which captures the video, Gear Motor & QR Scanner. According to the author [2], they implemented the system added RFID technology. In [3] smart shopping system is developed for blind people for whom purchasing the item will be quite difficult. So this system provides a way to the visionless person to but items in the shopping complex by using RFID technology [5].

The author in [4] focuses on a system in which the buyer puts any product into the trolley its details will displayed on the LCD. Based on the shopping list final billing reports get generated. Now here they have the option to delete some items from the list by removing the item from the trolley. These algorithms run on the Raspberry pi platform with the GSM module. A review ofthe smart Trolley system has been discussed in [7] in which the author has focused on RFID based shopping, smart trolley, automatic billing, smart trolley with automated billing.

PROPOSED METHODOLOGY

From the flowchart in Figure 1, it can be observed that the LCD connected to the main processing unit displays amessageis "Enter your number".By usingkeypadcustomercanenterthe10digit phone number manually. After entering the phonenumber LCDs"Scanyour items".Then scan the product one by one by showingit to the RFID sensor.Whiles canning the products,all theproduct details like product name,price, andTotal amount will be shown in theLCD. Ifaparticular productiss cannedeven several times then that particularproductis deletedfromthe billand the price of theproductisdeducted fromthetotalamount. And iftheproductisscanned an oddnumberoftimes then the productand price of that product are added in the bill. Once the shopping is completed the customer canpress thes

witch to end his/her shopping andtogeneratethebill. Afterpressing thes witchames sage willbe sent to the customer'sphone as well as to theadmin. The message containstheproductnameand theirrespective price,Total amoun talong with a unique bill ID.The message sentto admin contains thesamethingalongwith the customer's phonenumber to easyaccess.

The power source is connected to the micro controller to give sufficient powersupply for the smooth functioningof theproject.The16x2LCD is used to displaythe product name, price, and total amount, etc. The4x4 keypad is usedto enter thephonenumberof thecustomer.Theswitch is used to finish theshopping.The GSMmodule isused tosendthe message tothe customer whichcontainsthe product name, price, total amount, and unique Bill-ID.The same message is also sent to the admin alongwith thephonenumberof thecustomer.RFID is used to scan theproducts.

Simulation Results

Firstly, the whole system is power up and the LCD will display the Smart Basket on the LCD. After that through keypads manually enter the number shown in Figure 3(a) and Figure3 (b). Afterentering the number properly, LCD will display a message i.e."Scanyour items" shown in Figure 4(b). Then the customer needs to scan the item/productone by one by showingit to the RFID sensor shown in Figure 5(a). Whenever an item is scanned theLCD will displayits name alongwith itsprice as per the figure shown in 5(b). Afterdisplayingthe name and price, the LCD will displaythe total amount. Once the customer finishes his/her shopping he/she can press the button to end their shopping and generate the bill shown in figure .After pressing the button shown in figure 6.LCD will display a messagei.e. sending as shown in Figure 6(a).Oncethe messageis sent LCD will display a messagei.e. send shown in Figure 6(b). Both Customer and the admin will receive the same message on their phone which will havethename oftheitem/productalong with its price and at the end ofthe message total amount will be written shown in Figure 8(a).The admin can distinguish thebill of aparticular customer byusingthe billingid or the phonenumberof thecustomer, the phonenumberof the customer is onlysent to the admin message shown in Figure 8(b).

CONCLUSION

Theproposedmodelis user friendly. Time saving for the customers. Makes it flexible for all to use. Can be upgraded without any major hardware changes. No specific training required. Since RFID is used it will be quite low-priced. Since the system gets smart and autonomous the need of manpower can be reduced, thus benefiting the retailer by reduced man power. Since the envolvement of human is reduced the chances of human error and stealing of items the retailer also gains. This system would benefit the customers and the retailers at the same time as the number of customers served at the same time becomes higher.

Future Scope

This system can be further upgraded by the utilisation of more complicated algorithms and make shopping a better experience through automation. More updated controllers and programs can be utilised to improve the experience of customer and retailer.

ABSTRACT

Appliance control has been quite painful ever since its existence. Wireless control is an unavoidable solution to it. IoT has provided us the technology to control them through a wireless medium. Along with the capability of remote control, if we can know the current status of the appliances along with the usage duration, it would allow users to effectively evaluate their consumption. Electricity is a valuable resource, wasting it without utilizing it properly. This article concentrates on the capability of technology to trace the usage, consumption, and remote control. NodeMCU along with Raspberry Pi working through the internet, using the open-source database server "PHP My Admin" installed on Raspberry Pi enables us to achieve the above-stated goals. This setup also operates over Mobile phones with the internet. The system uses the MQTT protocol to communicate with multiple NodeMCU and stores the relevant information in the server (in this case the Raspberry works as the database server and Node MCU works as a controller as well as a wireless data communication).The NodeMCU detects the temperature and humidity level through sensors and published them to the webpage as well as the SQL Server (Raspberry Pi) for entry into the database. This data is also displayed on the mobile device used for controlling thereby making the user aware of the current status and accordingly AC or Fan can be turned on or off. The system is employed with an optional AUTO mode to turn on the light and fans. This experimental set-up can be employed in educational institutions and offices to reduce the usages of electrical appliances which saves electricity.

Keywords: Electricity, database, device, temperature, remote

INTRODUCTION

The future is the age of connectivity, where all the appliances will be connected to the network. This technology will be takingover the control and monitoring work into its responsibility.The system is assigned with this responsibility to ensure comfortable and suitable working and living spaces for people. The wireless room automation is all about controlling and monitoring of indoor atmospheric conditions through controllers and sensors. All the communication of data and information takes place through a wireless medium like Bluetooth or Wi-Fi. Apart from this feature of temperature and humidity control other services can be implemented like entertainment, telecommunication, surveillance, etc. can be integrated into the system. Automation through IoT enables the user to access the appliance control through the internet via any mobile device having internet facility from anywhere in the world.In this article, an automation system is proposed to control the appliances remotely through a web-based interface using the internet. The main goal of this work is to implement a cost-effective interface to automate the appliances and monitor them remotely.

RELATED WORK

Monitoring and automation have been quite fascinating work in the field of IoT. Wireless sensor networks have been employed along with the IoT platform to perform much more complicated task like Air Quality Monitoring[1, 2], monitoring of industrial environmental conditions in Wineries and Creameries[3], some researchers have also employed this WSN technology to monitor the occupancy in an energy-efficient way by using PIR's and mathematical modeling to meet the needs[4].A similar type of work is proposed by designing a well-equipped room with a proper environment control system using WSN and Mobile agents [5].

PROPOSED METHODOLOGY

This system is designed to operate independently but the data is stored centrally. This information can be accessed for further analysis. The NodeMCU is the main operating brain for the individual control unit for the rooms implemented. The control system has been implemented in three rooms of our university viz Dean's Room, Room no 12, and Room no 10. The NodeMCU's are connected to the fans and lights. The main sensor is also connected to the NodeMCU which informs the control unit to take necessary action to maintain the standard comfort parameters inside the room. All the sensor information is sent to the Raspberry Pi which acts as a local server for storing the information in an open-source database i.e. MySQL shown in Fig 1.

The user of the respective rooms can observe the current condition and operate through a web-based application designed through HTTP and PHP. The user can use any device that has the capability of using the internet and a user interface with a web browser. The individual controller has its web-based application. The Raspberry Pi is also equipped with a similar type of app that can monitor all the controllers at the same time. The NodeMCU is the control unit to be installed individually in every room under consideration. Here in this experimental set-up, three rooms are taken into consideration, the Dean's Room, Room No 10, and Room no 12. Each room is equipped with a DHT11 module to monitor the Temperature and Humidity as shown in figure 1.

Each NodeMCU is programmed and associated with its dedicated Web-Based Applications to monitor and operate independently. It is programmed to take the sensor readings and update them into the database. Then compare the data from the database with the desired parameters and operate the appliances (Fan and Light) the lights are user-controlled as its an official set-up but the fans can be controlled by the controller directly. The controller actuates the appliances through a relay module connected to it as shown in figure 2. the relay module used in this project ate Active Low triggered, hence the NodeMCU has to give a low signal to activate an appliance.

The complete connection of the project is as described graphically in figure 3. Here it can be observed that the fans and lights are connected through the relay module, the sensor is connected to the NodeMCU. The controller is connected to the internet through the router. The Raspberry Pi operating as the local server equipped with the open-source SQL server "MySQL" is also connected to the internet through the router. And all the information is stored in the database server through the internet. This stored data can be accessed by the user through the internet using any handheld mobile devices or desktop provided they have internet access and have a GUI to operate the Wen Based Application.The commands are passed on to the controller through a user interface designed through HTTP and PHP. The interface is password protected as shown in figure 4.

The page is secured to avoid any unauthorized access. Upon successful login, the interface directs the user to open the page corresponding to the room to access as shown in figure 5. The data from the controllers are transferred into the local SQL server as shown in Figures 7, 8, and 9. The respective information from the controllers in the rooms is saved here in a very organized manner for further access and analysis. This information contains the data from the sensor and the status of the appliances, i.e. for how long they have been in operational condition with a corresponding timestamp. The data is posted on an hourly basis taking into consideration the standard duration of a classroom lecture. The Raspberry Pi operates like a local server to the experiment and stores the information and provides them as needed to the NodeMCU and the user.

RESULT AND DISCUSSION

Upon analyzing the database and plotting the curve from the available data for an individual room the following plots are obtained as shown in figure 13, figure 14, and figure 15. Analyzing the plot for the Dean's room it observed that the temperature and humidity are staying quite stable and constant as the number of visitors to Room 1is quite limited.Similarly analyzing the plot for room no 10 it is quite clearly observed that thought temperature level remains quite stable due to the usage of Air Conditioner the humidity level has quite a few spikes when the number of occupants changes inside the room.Observing room no 10 it's observed that the increase in student strength increases humidity level inside the room due to the hot climate. But the Air Conditioner quite significantly struggles to bring the temperature down resulting in reduced humidity but fails to bring the temperature down.

CONCLUSION

From the experimental set-up, it became quite clear that this system of room monitoring, controlling through IoT is quite user friendly and informative in accumulating data related to the environmental parameter inside a room.Using this method, it can be made possible to track the usage and wastage if electricity at the workplace.This system can be further upgraded to operate the Air Conditioner and lights in a fully automatic mode. It can be scheduled for classrooms and operate automatically without the intervention of the user. This would enable the practice of controlling the wastage of electricity.

ABSTRACT

This articleis targeted to investigate the aid forthe mobility of blind and visually impaired people. It is supported by a processing unit called LPC2129 with synthetic speech output. This system is also comparatively low cost, small, portable, and provides information about the routes to the user which aids in making decisions. The system is provided with sensors like ultrasonic and vibrator to reduce the outdoor walking difficulties of the blind man. The proposed arrangement detects the nearby obstacle via stereoscopic sonar system and a vibrotactile response is sent back to inform the visionless people about its location & warn from the nearby vehicle. The foremost observation of this paper is to produce electronic support as guidance to overwhelm the lacking of visualization power by proposing an easy, safe, cost-efficient, customizable guidance system for the visually impaired. The suggested electronic system senses the obstacles in its path by transmitting the ultrasonic waves through the ultrasonic sensor. This CPUreceives the signal from thesensors,performs few calculations,and then it alerts the blind pedestrians through a sound and also with a vibration. One of the advantages of the proposed system isits voice-based announcement for straightforward navigation which can assist a blind pedestrian to undergo a busy road. Moreover, this system is an acoustic guidance system for the visually impaired pedestrians using the transformation of ultrasonic-to-audio signal.

Keywords: LPC2129, Ultra-Sonic Sensor, Vibrator motor, Visually Impaired

INTRODUCTION

Blindness is the loss of temporary or permanent sight. This condition of someone creates difficulty with normal daily activities like driving, reading, socializing, and walking. And also reduced vision isn't corrected by glasses or contact lenses. Globally the reason for visually impaired is refractive errors, cataracts, and glaucoma. Even there are plenty

of disorders that will cause sight problems are age-related devolution, diabetic retinopathy, corneal clouding, childhood blindness, and number of infections.

Screening is the techniques for vison problem which can help individuals to enhance their future vision. 80% of the visually impaired person which is estimated by the globe Health Organization can either be preventable or curable with treatment, but people are avoiding visiting the attention test. From the literature, within the year 2015, 940 million people with vision loss, 246 million with low vision, and 39 million were blind[1]. But since the 1990s the visual disorder rates are decreased.

There are classifications of visual impairment based on the World Health organization are given below in Table 1.There are different strategies available to address vision impairment which is very much cost-effective and feasible to implement. Over the last few years, WHO has established and executed several tools to upkeep countries to estimate the provision of eye care services. They are 1) eye care services assessment tool, 2) Tool for assessment of diabetes and diabetic retinopathy, and 3) Tool for assessment of rehabilitation services and systems. World Health Organization has also developed the World report, these reports focused on ensuring comprehensive and integrated eye care in countries. From the technology perspective [2], people with vision loss use two broad categories 1) General Technology and 2) Assistive Technology. General technology covers computers, hand held devices, GPS, and GSM devices. But assistive technology is aimed to aid people with vision loss or other disabilities including screen readers, video magnifiers, and other devices for reading and writing. Though there are different steps taken by the government for the visionless people. This paper will talk about how technology can help the blind pedestrian to cross the road or walk through anywhere at any time. [3] According to the World Health Organization, 270,000 pedestrians face severe accidents on road every year. Moving safely is the fundamental right for everyone. The feeling of insecurity among everyone mind mainly the old and the blind people causes them to stay at home which reduces mobility.

The risk for the pedestrians is both from driver's behavior and infrastructure.Behavior is related to the speed of the vehicle, mobile phone use during driving, alcohol, and drugs. Infrastructure may be related to roadway design and lack of visibility. To make visual impaired people travel independently mainly uses auditory and tactual information. When an obstacle is detected in the close vicinity of the the sensor it sends an information to the vision impired person in the form of sound and vibration.The main concept of the paper is to provide an electronic aid as guidance to overcome the lacking of visualization power by proposing a simple, efficient, electronic guidance system for blind and visually impaired pedestrians. It is a helping aid to blind people for their navigation through a busy environment. The system will sense the obstacles for the person and will give alerts with sound and vibration. The blind person can carry a stick to get rid of the accident-prone Zone.The different system has been developed by different people to help blind people. The paper is organized as follows; Section 2 presents the literature review on implementation of various techniquesfor vision-impaired people, Section 3,discuss the proposed methodology,Session 4 highlights hardware and Software used implemented to implement the system, in Section 5 presents the simulation results, Session 6 Concludes with discussing the future work and suggested techniques which may be advantageous on application.

LITERATURE REVIEW

This section deals with various types and levels of work done for the safety of blind people. As [6] we know that there are more no. of blind people in the society, who suffers from traveling. The various technological blind stick has been developed for the safety of the blind people so that they can walk easily on the road. The authors focus on electronic technology which uses PIC microcontroller, 3 ultrasonic sensors, and buzzer, to provide fully automatic obstacle avoidance with notification in the form of voice [1]. Here the simulation and PCB design for the system is done through Proteus v7.8. This is a very vital step that an author has taken to design and implement the circuits

before it comes to real hardware use.In the next paper author [2] proposed a simple, cheap, user-friendly, smart system that improves the mobility of visionless people in the specific area. They have used PIC microcontroller, infrared sensors that emit IR waves and scan a predetermined area surrounded by blind people. This system calculates the direction and distance of the objects and alerts the user about the obstacles shape, materials, and direction.

As we know that the technology is moving and changing very fast, based on the technology advancement here author [3] describes the smart stick for the blind person. This stick uses technologies like PIC 16F877, GSM, LDR, Android application, ultrasonic sensor, Facebook server, and Bluetooth. The switch with an emergency functionality can help the user to communicate with their relatives through voice calls or SMS. They reveal that onboard implementation will be more efficient and accurate and more convenient to use.

Now the paper [4] proposed an Arduino Nano, Bluetooth, ultrasonic based obstacle finding stick for visionless people which helps to detect the path using an ultrasonic sensor and MIT Android App. And also informs the blind person about the circumstances and present condition of the path. Many papers developed the smart and blind stick based on sensors and Arduino variants for visually impaired people. The system was designed, programmed using C Language, and tested for accuracy and checked, which can detect obstacles within 2 m [5]. The study in [7] proposed the sensor-based stick for blind people. Here the main objective is to develop a system which can detect the object in various direction, detecting pits, and manholes on the ground to make free to walk for the blind people. This system uses multiple sensors with features that are used to detect the obstacles. The prototype system modeling is done in Pro/E creo 5.0 Software.

The external battery used can be recharged through solar panels for instance.The main objective of the paper cover in [8] is to provide a voice-based intelligent system that assists blind people by using an ultrasonic sensor and Infra-Red sensor. The prototype stick is capable of detecting obstacles in the range of 4 meters and gives a suitable message to blind people to move twice the normal speed. Here the author has used the PIC microcontroller which uses the ADC to convert the Analog value received from the sensors connected to the system. The whole programming uses the embedded C programming language. They have also taken the help of the Proteus simulator tool to do the simulation of the whole circuit. The main objective of this paper is to focus on LPC2129 based ARM7 Processor, GSM, GPS, Ultrasonic Sensor, Switch, and buzzer and vibration sensor to help the blind people to move freely. He a device can be designed for blind people that help them to travel independently and also it must be comfortable to use.

PROPOSED METHODOLOGY

The proposed system is designed to collectinformation about the environment via ultrasonic sensors and extracts the information. Thisinformation obtained is then transformed into an audio signal after justified calculations and processing due to which the blind pedestrian can interprete the surroundingsthroughthe sound generated by the system. The entire operation of the project is described by using a diagram which graphically explains the method and concept as shown in figure 1. In this figure all the components used to perform the experiment is shown.
The figure 2(a) figure 2(b) shows the communication between the various modules used in the project and how the various modules communicate and the operation flow respectively.

In the proposed model the circuit is assembled and the program is executed. The Panic button and Ultrasonic sensor are acting as interrupts connected to the Centeral Processing Unit for immediate sensing and responding to the environment. Here the ultrasonic sensor is producing the waves continuously. When the obstacles come into the vicinity of the sensor then it creates a vibration and buzzing sound. In case of panic, the switch is pressed interrupt 1 gets activated and data from the GPS receiver is collected and then the data is sent to the blind person's family

member through the GSM module. The LCD is used to display the longitude and latitude received from the GPS receiver before sending them to the family members. In case of ultrasonic sensor receives the presence of an obstacle then interrupt 2 is activated and the blind person is alerted with the help of a buzzer and a vibrator about the presence of the obstacle. In the case of encountering an obstacle, the LCD will show the presence of the obstacle.
The alerting system consists of dc motors that can be moved at different speeds for providing the sensation about the obstacle. In the case of any emergency, the blind people can alert his dear one by simply pressing on a switch. The GPS module connected in the system will locate the blind man's position and a message is sent using a GSM module.

Use of Hardware & Software

In this to develop the system-specific microprocessor cores and a family of tools, libraries, and off-the-shelf components are used. ARM is one of the important options available for Embedded System development. It is developed by ARM Holdings and based on RISC architecture. It works on 3.3 v as compared with the Arduino variants. The use of the ARM processor reduces costs, heat, and power use. LPC2129 Microcontroller is one of` the widely used Integrated Circuits from the ARM-7 family. It has 40 KM of RAM, 512 KB of ROM, 10 bit ADC, DAC, timers/Counter, ISP, VIC support and CPU operating voltage range of 3.0 V to 3.6 V. There are multiple pins used for a different purpose related for the prototype model development Table 2.

GSM

GSM is the most commonly used mobile communication system. It operates at 850MHz, 900MHz, 1800MHz and 1900MHz frequency bands. It uses TDMA technique for commumication. It digitizes and sends the information in 2 streams of data in a specific time interval. It has a capacity of 120Mbps information handling rates. Its associated with a sim card, upon receiving the digit command it sends the information through SMS.

GPS

A Global Positioning System, otherwise known as GPS is designed to assist navigation on land water and air. There are GPS satellites in the space to triangulate the location and send the coordinates to the GPS sensor. That information is received by the controller and processed in to an interpretable format for the user. A network of 31 satellites covers the entire earth surface. The coordinartes are triangulated by calculating the distance form atleast 4 satellits and the coordinates are calculated.

Ultrasonic Sensor

An ultrasonic sensor is a device that works on the principle high frequency sound travelling through air and receiving of reflected sound waves getting received by the sensor. By calculating the time difference the distance of the reflecting surface from the origin can be obtained.
The expression for the above explation is as below:
Distance = (high level time * speed of sound (340M/S) / 2).

DB9 Connector with Cable

It is an analog 9-pin. It is mainly used for serial connections, allowing for the asynchronous transmission of data with a standard RS-232 (RS-232C).These are used to change the cable connection type shown in Fig 3. They can easily be soldered to a custom length cable creating a durable connection for all applications. These connectors are made with high-quality materials to ensure durability and long life. The kit includes the crimp connector, crimp pins, a plastic hood, and all hardware.Here DB9 Connector was used for two purposes, 1) for dumping the code into LPC2129 and 2) for Connecting GPS and GSM to LPC2129.

EXPERIMENTAL RESULT

The main aim was to help the blind people when they come out alone on the road. A test model or we can say a tabletop model has been developed. The process is as follows in two steps.When the panic button is pressed the code is dumped into the controller using USB to UART converter cable.After the reset button is pressed the program starts running displaying BLIND NAVIGATION the name of the project in Fig 4 and waits for the inputs which are connected as interrupts to pin p0.03(Switch) and p0.07(Ultrasonic Sensor). The16X2 display is used in an 8-bit mode to show the simulated outputs on it.In the real project, the LED will be replaced with a buzzer for the warning, and the vibrator will be connected for vibration feedback.The GSM and GPS modules are connected using DB9 connecter cables to the UART0 and UART1 of LPC2129.]

Then it enters an infinite WHILE loop where it waits for the input from the user, the input here is the switch which acts as the PANIC BUTTON shown in Fig 5.After the PANIC BUTTON is pressed the GPS function is called which collects data (longitude and latitude) from the GPS receiver and stores them in the assigned arrays shown in Fig 6, Fig 7 & Fig 8. The Lattitude data received is 1255.5618,N,is stored in array latt[ ] and the Longitudinal data received is 07736.0066,E, is stored in array long[ ]. The data from the GPS model is sent to the family members through the GSM module to the mobile phone shown in Fig 9.

The second part is when an obstacle is detected after the reset button is pressed the program starts running displaying BLIND NAVIGATION the name of the project. Then it enters an infinite WHILE loop where it waits for the input from the user, the input here is a high pulse from the ultrasonic sensor when an obstacle is sensed shown in Fig 10& Fig 11. When an obstacle is sensed, it enables a buzzer and vibrator. A vibrator is used to give feedback to the blind person in the form of vibration and buzzer is used to alert person by giving a buzzing sound.After alerting the blind person about the obstacle with the help of a buzzing sound and vibration feedback the code returns into the infinite while loop and again waits for the interrupt to happen. And when there is no obstacle then again it will come to the infinite loop.

CONCLUSION

This navigation system for the visually impired converts the environmental information of the up-coming obstacle into electrical signals. These electrical signals are then converted into equivalent audio signals and ill-vision person gets an information of its surrounding. Based on the audio signals the pedestrian can navigate with ease through the roads. If in-case the pedestrian with vision issue feels an uncomfortable situation he or she can push the panic button that will immediately take the GPS location from the sensor and write an SMS having the coordinates. Here the GSM module plays its role to process the SMS and send it to the near and dear ones. This will inform them of the location of the user so that the person can be tracked through the coordinates supplied. More sophisticated sensors and with higher range can be used to help them have more information hence a safer navigation through the roadways. The experimental set-up can be further upgraded to utilize a camera and convert the surrounding images into electrical signals and feed them to the nervous system giving the vision less person a virtual vision.

ABSTRACT

This article is designed to demonstrate the metro technology used as a prime mode of transportation in the developed countries. These trains are equipped with an auto-pilot option that enables automatic running of the train from one station to another. Though it is known as auto pilot, actually human intervenetion is required to enable and disable this feature.The proposed system is supposed to eliminate the need of human intervenetion. The system uses an LPC2148 microprocessor thar belongs to the family of ARM 7. The metro platform equipped with the small tools i.e. the IR sensor modules. The IR sensor installed in the platform triggers the train stop sub-routine. Then the sub-routine for opening the door of metro is executed. The passangers can now board the train. The door sub-routines closes the door after a specified time period. The compartments are also mounted with sensors that counts the number of passangers boarding and de-boarding the trains. The train closes the door when the maximum occupancy level is reached even if the allotted time for the door is not over. An alert is triggered just before the door closes. The train repeats the process at every station. This system is further enhanced by making the control system display the status for the passangers convenience. This status display consists of arrival and departure timings for each upcoming station.

Keywords: LPC2148, IR Sensor, DC Motor, LCD, Buzzer

INTRODUCTION

Train travel is one of the economical mode of public transportation. Train being slow the Metro train is the alternative to train travel as a faster mode of transportation. Its faster, safer and economical mode of public transportation, in the modern days. The driverless metro train allows a significantly secure and high-performance

means of transportation. The proposed system makes use of a microprocessor to control the movements of the train. This system has the feature of counting the number of passangers boarding and de-boarding the train. The counting system controls the opening and closing of doors. The proposed system also comprises a collision avoidance systemincase two trains are directed on the same track. The distance between the stations are pre-defined so they can operated without human intervention. The system is enabled with an emergency switch for emergency braking of the train.

Rail transportation means transferring huge no. of gods and humans from one place to another. Booking of railways tickets is becoming more concern because of the increased rate of the population. Earlier individuals used to stand in a queue to get tickets. This method was very much time taking. To overcome this various mechanism has come across to provide comfort to the individuals during ticket reservation. One important method is to use the biometric-based ticketing system [1], RFID based ticket reservation system, and fingerprint-based ticket reservation system. All the mentioned technologies use a unique identifier for each individual. The whole process consists of starting from registration to booking and validating on the date of the journey. But RFID [4] system type of reservation system is much more complex and has a drawback. This is because an individual has to carry the RFID tag during the time of Journey and it creates problems if in-case by any means the individuals forgot to carry the tag [7].Many have used GSM, GPS, ZigBee, and RF technology [8].

The study of each technology brings an improved solution to the society in terms of cost, convenience, user satisfaction, and future implementation. Based on the technology one has to select which suits the common public and visionless people. Some literature generates a ticket printing system with the help of QR code [2] for the passenger. While implementing the prototyping model they have to make use of different processors and controllers and different peripheral devices like Raspberry Pi, ATmega 16, printers. Arduino etc. Going towards the deeper literature survey, we found that few papers use face recognition [6] system for fare calculation deduction system utilizing the automatic system using a camera. The above technology helps the individuals save time required for ticket reservation and also increase the accuracy level of the tickets which is performed daily. The different country like the UK has adopted smart and integrated ticketing Technology. In that paper, authors have suggested both the legal and commercial risks associated with the ticketing system.

PROPOSED METHODOLOGY

The proposed methodology consists of two parts the first part tell about the Flow chart and the 2nd part tells about the block diagram of the proposed system. The Flow chart gives overall idea about the weather system that is developed using LPC2148 and GSM module. In simple words it can be explained as when the GSM module is turned on and the network is available it waits for the message and when the message is received it matches with the code word if it matches exactly when it will since the surrounding area's temperature and humidity and sends the data to the sender of the message. If the signal is not available, it waits still it gets signal. If the received message is not matched, it will send a response saying "try again" to the sender number. After completing one cycle it again waits for the next message to come. This process is repeated continuously.
The fig 3 represents the communications between the different components of the project. The micro-controller is LPC2148 it communicates among IR sensor, LCD, and DC motor. IR sensor communicates between motor and LPC2148 Board. The IR sensor will send the interrupt signal to the LPC2148.

Hardware & Software Description

This work consists of the following hardware LPC 2148 Mini Board, LCD, DC Motor Driver IC, DC Motor, IR Sensor, Jumper Wire, Buzzer, Power Supply (12v adaptor), and Fingerprint Sensor.
Microcontroller Board:LPC2148 mini development board is used to develop the prototyping model.

Motor & Motor Driver Circuit: Dc motor is used to drive the metro train.
Sensor Module: Basically will concentrate on the IR sensor, Fingerprint Sensor, Buzzer as an input, and output devices connected to the main processor unit.

Fingerprint Application
The above figure is called as Fingerprint Application. Here, we can enroll new fingerprints and also can delete the older ones. To make this application run, we need to follow the steps:

- Open Device (O)
- Choose the COM Port (identifying it from the Device Manager)
- Enroll (add new fingerprint)

This above step will help to add a new fingerprint.
Further, we can use Search option to find whether the fingerprint exist or not.

Flash Magic: This is a utility application which is used to upload the hex file into the microcontroller board through the UART port. From the figure we can see that it consists of 1) option to select the microcontroller, 2) COM port, 3) Baud Rate, 4) Interface 5) Oscillator Frequency, 6) Browse for hex file. 7) Start to upload the hex file. This is done by serial communication using UART (Universal Asynchronous ReceiverTransmitter) by connecting PC with UART0 of microcontroller using RS232 (DB 9 cable) connector.

Simulation Results

The below algorithm gives an idea of how the setup works for a single run of the code.
Step1: Firstly include all Header files.
Step2:Declare different functions used and global variables.
Step3: Include delay functions file and LCD related files that are being used.
Step4: The main function is started and different variables used in the program are declared.
Step5: Motor pins were declared.
Step6: Interrupt pins were defined.
Step7: Wheel motor pins are made high for the running of the metro wheel.
Step8: When an interrupt is occurring for the 1st IR then the wheel motor pins are made low and the door motor pin is made high.
Step9: Then 2nd and 3rd IR sensors are continuously monitored and person count is maintained.
Step10: After 30 seconds or if the person count reaches maximum whichever is earlier, the buzzer will beep, and simultaneously the door motor pin will be made high for opposite direction movement.
Step11: Then the wheel motors are made high again.
Step 12: It will continuously check for step 8 and if an interrupt occurs then it follows the same flow again.
The fig 7 represents the interface between the Finger Print Sensor (R305)Module with LPC2148 Microcontroller. Here we have connected the RX and TX pin of using UART pins of LPC2148.It is scanning the fingerprint and matching it with the database saved earlier.

Figure 8 shows that the fingerprint given, matches with a record present in the passenger database. The figure 9 and 10 shows that after a match is found in the passenger database it displays the passenger information and successful booking of ticket message is printed up respectively. The figure 11 shows the LCD shows the required fare for travelling to the destination and that much amount is deducted from the passenger account. The above figure 12 shows that if any unauthorized person is trying to book a ticket and record is not found in the passenger database then it denies and show that no match was found. The above figure 13shows that in normal condition the metro wheels are rotating and the door motor is in the stop position.
The above figure 14 shows that after the interrupt is raised for the 1st IR sensor then the wheel motors stop rotating and the door motor starts rotating for 2 seconds. The above figure 15 shows that after the door is open it will continuously monitor the 2nd and 3rd IR for monitoring the person count i.e. incrimination and decrimentation of

person count. The above figure 16 shows that the door will be open for 30 seconds and simultaneously wait for the maximum number of person count and whichever occurs first, then the buzzer will beep and the door will be closed and the door motors will start running again.

CONCLUSION

Its clearly evident from the experimental setup and the operation that it works quite well in the model. Use of the IR sensors can be replaced by by industrial sensors as we know that though IR sensors are rugged they are sensitive to sunlight and might work eratically. It runs in the principle of line of sight, so such typr of sensors can be utilised in the implementation. Implementing this prototype in real life would enable us make the train travel comfortable and precise. This system can be further upgraded to monitoring the train control remotely with an emergency remote control system for the worst case scenario. The facilities provided in the prototype is solely for the comfort and convenience of the passangers. This proposed system will lead to upgrade the train technology to a new level by taking optimum care of the passangers comfort, safety and punchuality.

ABSTRACT

2019 Novel corona-virus (2019-nCoV) also referred to as severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. *In silico* Molecular Docking revealed that the phytochemical, Vasicine effectively binds at the active pocket of the SARS-CoV-2 main protease.

Keywords: 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, vasicine.

INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe. The city of Wuhan was the epicentre where the outbreak of this human pathogen emerged, and resulted to human ailment, termed as COVID-19 [1, 2]. 2019-nCoV encodes at least 27 proteins, including 15 non-structural proteins, 4 structural proteins, and 8 auxiliary proteins. SARS-CoV-2 belongs to the beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3, 4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1, 5, 6]. Crystal structure of the SARS-CoV-2 main protease (M^{pro}) proves to be an exceptional ground for screening specific ligands [7]. Reportedly, M^{pro} and other known viral proteins are defining features paving the path of virus from entry to infection in the host cell [8, 9, 10].

METHODS

Viral Protein Structure and Phytochemical dataset collection

The 3D structure of M^{pro} was accessed from Protein Data Bank accession 6Y2E. The phytochemical, Vasicine was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

Molecular docking

For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the M^{pro} protein was specified and targeted for binding of the ligand. CDOCKER Energy and CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors. Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the CDOCKER Energy and CDOCKER Interaction Energy are considered to be the most favourable [12].

RESULTS AND DISCUSSION

It was found that vasicine; a common phytochemical specifically binds to the active pocket of the SARS-CoV-2 M^{pro} as apparent from higher CDOCKER energy and CDOCKER interaction energy (Table 1). Since, simple active bio molecule like Vasicine effectively binds into the active pocket of the M^{pro} under *in silico* conditions it is quite possible to design pharmacophore molecules based on the structural and functional identity of Vasicine and eventually can be used in the pharmaceutical sector.

CONCLUSION AND FUTURE PERSPECTIVES

The current *in silico* molecular docking based study reveals that vasicine can target the reported SARS-CoV-2 M^{pro}. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Vasicine is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like vasicine which can be employed for designing novel therapeutics.

ABSTRACT

2019 Novel corona-virus (2019-nCoV) also referred to as severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. *In silico* Molecular Docking revealed that the phytochemical, Aloeemodin effectively binds at the active pocket of the SARS-CoV-2 main protease.

Keywords: 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Aloeemodin

INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe. The city of Wuhan was the epicentre where the outbreak of this human pathogen emerged, and resulted to human ailment, termed as COVID-19 [1, 2]. 2019-nCoV encodes at least 27 proteins, including 15 non-structural proteins, 4 structural proteins, and 8 auxiliary proteins. SARS-CoV-2 belongs to the beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3, 4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1, 5, 6]. Crystal structure of the SARS-CoV-2 main protease (M^{pro}) proves to be an exceptional ground for screening specific ligands [7]. Reportedly, M^{pro} and other known viral proteins are defining features paving the path of virus from entry to infection in the host cell [8, 9, 10].

METHODS

Viral Protein Structure and Phytochemical dataset collection

The 3D structure of M^{pro} was accessed from Protein Data Bank accession 6Y2E. The phytochemical, Aloeemodin was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

Molecular docking

For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the M^{pro} protein was specified and targeted for binding of the ligand. CDOCKER Energy and CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors. Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the CDOCKER Energy and CDOCKER Interaction Energy are considered to be the most favourable [12].

RESULTS AND DISCUSSION

It was found that Aloeemodin ; a common phytochemical specifically binds to the active pocket of the SARS-CoV-2 M^{pro} as apparent from higher CDOCKER energy and CDOCKER interaction energy (Table 1). Since, simple active bio molecule like Aloeemodin effectively binds into the active pocket of the M^{pro} under *in silico* conditions it is quite possible to design pharmacophore molecules based on the structural and functional identity of Aloeemodin and eventually can be used in the pharmaceutical sector.

CONCLUSION AND FUTURE PERSPECTIVES

The current *in silico* molecular docking based study reveals that Aloeemodin can target the reported SARS-CoV-2 M^{pro}. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Aloeemodin is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Aloeemodin which can be employed for designing novel therapeutics.

Author contribution statement

GKP conceived the idea. GKP, SKS, PKP performed the experiments. All authors have significant contribution in drafting the manuscript.

Funding

ABSTRACT

2019 Novel corona-virus (2019-nCoV) also referred to as severe acute respiratory syndrome Corona-virus 2 (SARS-CoV-2) emerged as a global risk and put the entire globe into unrest. Unavailability of specific drug against the virus is more imperative. *In silico* Molecular Docking revealed that the phytochemical, Kaempferol effectively binds at the active pocket of the SARS-CoV-2 main protease.

Keywords: 2019-nCoV, SARS-CoV-2, SARS-CoV-2 main protease, docking, phytochemicals, Kaempferol.

INTRODUCTION

The pandemic situation caused due to the 2019-nCoV represents a severe public health calamity across the globe. The city of Wuhan was the epicentre where the outbreak of this human pathogen emerged, and resulted to human ailment, termed as COVID-19 [1, 2]. 2019-nCoV encodes at least 27 proteins, including 15 non-structural proteins, 4 structural proteins, and 8 auxiliary proteins. SARS-CoV-2 belongs to the beta corona-virus genus, closely related to the previously identified severe acute respiratory syndrome corona-virus (SARS-CoV) [3, 4]. Public Health Emergency of International Concern (PHEIC) was declared by the World Health Organization (WHO) owing to its fast rate of transmission within the humans [1, 5, 6]. Crystal structure of the Papain-like Protease of SARS-CoV-2 proves to be an exceptional ground for screening specific ligands [7]. Reportedly, M^{pro} and other known viral proteins are defining features paving the path of virus from entry to infection in the host cell [8, 9, 10].

METHODS

Viral Protein Structure and Phytochemical dataset collection

The 3D structure of Papain-like Protease of SARS-CoV-2 was accessed from Protein Data Bank accession 6W9C. The phytochemical, Kaempferol was obtained and consequently both the protein and the ligands were used for *in silico* analysis.

Molecular docking

For the *in silico* molecular docking, BIOVIA's Discovery Studio docking method [11] was used for molecular docking. The catalytic pocket of the Papain-like Protease of SARS-CoV-2 was specified and targeted for binding of the ligand. CDOCKER Energy and CDOCKER Interaction Energy signify the affinity of the ligands with the protein receptors. Basically, high positive values of the CDOCKER Energy, CDOCKER Interaction Energy and a diminutive difference between the CDOCKER Energy and CDOCKER Interaction Energy are considered to be the most favourable [12].

RESULTS AND DISCUSSION

It was found that Kaempferol; a common phytochemical specifically binds to the active pocket of the Papain-like Protease of SARS-CoV-2 as apparent from higher CDOCKER energy and CDOCKER interaction energy (Table 1). Since, simple active bio molecule like Kaempferol effectively binds into the active pocket of the M^{pro} under *in silico* conditions it is quite possible to design pharmacophore molecules based on the structural and functional identity of Kaempferol and eventually can be used in the pharmaceutical sector.

CONCLUSION AND FUTURE PERSPECTIVES

The current *in silico* molecular docking based study reveals that Kaempferol can target the reported Papain-like Protease of SARS-CoV-2. It would be extremely noteworthy being confirmed *in vivo*. It is crucial to develop diagnostic tools, potential therapeutics and antibodies selectively for the COVID-19 proteins. Phytochemicals like Kaempferol is commercially available and thus may be effectively prescribed to circumvent the current global scenario. Essentially, this study makes an attempt to reveal simple phytochemicals like Kaempferol which can be employed for designing novel therapeutics.

Author contribution statement

GKP conceived the idea. GKP, SKS, PKP performed the experiments. All authors have significant contribution in drafting the manuscript.

Funding

The present study was financially supported by Centurion University of Technology and Management, Odisha, India.

ACKNOWLEDGEMENTS

Authors are thankful to the administration and management of Centurion University of Technology and Management, Odisha, India for providing necessary facilities to conduct the experiment.

Conflict of interest

The authors declare that they have no conflict of interest.
