"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with vanillic acid of cocoa plant. The important enzyme of corona virus chosen was 6W4B.

RESULTS AND DISCUSSION

Table 1 shows that vanillic acid can block 6W4B enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6W4B. The pharmacophore had SMILES code CC(C)C[C@H]1S[C@H](C)C(=N1)C. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that vanillic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6W4B enzyme of corona virus had SMILES code CC(C)C[C@H]1S[C@H](C)C(=N1)C.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6W4B enzyme of corona virus was identified. A pharmacophore equivalent to vanillic acid obtained from cocoa plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code OC(=O)c1[nH]c(C(=O)O)c2OCCOc12.

Keywords: Corona, Virus, Docking, Pharmacophore

The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with vanillic acid of cocoa plant. The important enzyme of corona virus chosen was 6W4B.

RESULTS AND DISCUSSION

Table 1 shows that vanillic acid can block 6W4B enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6W4B. The pharmacophore had SMILES code CC1(C)O[C@@H](CC(=O)O)C(=O)O1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that vanillic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6W4B enzyme of corona virus had SMILES code CC1(C)O[C@@H](CC(=O)O)C(=O)O1.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6W4B enzyme of corona virus was identified. A pharmacophore equivalent to vanillic acid obtained from cocoa plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code N[C@@H](CS(=O)CC=C)C(=O)O.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with vanillic acid of cocoa plant. The important enzyme of corona virus chosen was 6W4B.

.RESULTS AND DISCUSSION

Table 1 shows that vanillic acid can block 6W4B enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6W4B. The pharmacophore had SMILES code N[C@@H](CS(=O)CC=C)C(=O)O. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with vanillic acid of cocoa plant. The important enzyme of corona virus chosen was 6W4B.

RESULTS AND DISCUSSION

Table 1 shows that vanillic acid can block 6W4B enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6W4B. The pharmacophore had SMILES code CNC(=O)CN1C(=O)CCC1=O. Positive values of "-CDOCK Energy and -CDOCK interaction energy"indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that vanillic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6W4B enzyme of corona virus had SMILES code CNC(=O)CN1C(=O)CCC1=O.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6W4B enzyme of corona virus was identified. A pharmacophore equivalent to vanillic acid obtained from cocoa plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code NC(=O)c1ccc(NCC(=O)O)cc1.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with vanillic acid of cocoa plant. The important enzyme of corona virus chosen was 6W4B.

RESULTS AND DISCUSSION

Table 1 shows that vanillic acid can block 6W4B enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6W4B. The pharmacophore had SMILES code NC(=O)c1ccc(NCC(=O)O)cc1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that vanillic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6W4B enzyme of corona virus had SMILES code NC(=O)c1ccc(NCC(=O)O)cc1.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code CON1[C@@H]2CCCC[C@@H]2N(OC)C(=O)C1=O.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CON1[C@@H]2CCCC[C@@H]2N(OC)C(=O)C1=O. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CON1[C@@H]2CCCC[C@@H]2N(OC)C(=O)C1=O.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CCC(=O)Oc1sc(NCCc2ccccc2)[n+](C)c1C. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CCC(=O)Oc1sc(NCCc2ccccc2)[n+](C)c1C.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code CCc1c(C(=O)OC)c2cc(O)ccc2n1Cc3ccccc3.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CCc1c(C(=O)OC)c2cc(O)ccc2n1Cc3ccccc3. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CCc1c(C(=O)OC)c2cc(O)ccc2n1Cc3ccccc3.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code CCOC(=O)C(N(C)C)C(=O)OCC.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CCOC(=O)C(N(C)C)C(=O)OCC. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CCOC(=O)C(N(C)C)C(=O)OCC.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code C[NH2+]CC(=O)c1ccc(O)c(O)c1.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the

viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code C[NH2+]CC(=O)c1ccc(O)c(O)c1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code C[NH2+]CC(=O)c1ccc(O)c(O)c1.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code C[NH+]1CCN(Cc2ccccc2)CC1.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code C[NH+]1CCN(Cc2ccccc2)CC1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code C[NH+]1CCN(Cc2ccccc2)CC1.

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CC(=O)NC(NC(=O)C)C(=O)c1ccccc1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CC(=O)NC(NC(=O)C)C(=O)c1ccccc1.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code Cc1oc(C[N+](C)(C)C)cc1.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

Methodology: "Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code Cc1oc(C[N+](C)(C)C)cc1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code Cc1oc(C[N+](C)(C)C)cc1.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CCN(CC)Cc1cc(N)ccc1O. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials.

The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CCN(CC)Cc1cc(N)ccc1O.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code C[N+](C)(C)Cc1c[nH]c2ccccc12.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized.
Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code C[N+](C)(C)Cc1c[nH]c2ccccc12. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code C[N+](C)(C)Cc1c[nH]c2ccccc12.

The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized.Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu

used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION13

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CCOC(=N)c1ccc(O)cc1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CCOC(=N)c1ccc(O)cc1.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code O=C1N[C@H](CO1)c2ccccc2.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code COc1cc2C[NH2+][C@@H](Cc2cc1OC)C(=O)O. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code COc1cc2C[NH2+][C@@H](Cc2cc1OC)C(=O)O.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code CC(=O)CCc1c(C)c(OC(=O)C)c(C)c(C)c1OC(=O)C.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CC(=O)CCc1c(C)c(OC(=O)C)c(C)c(C)c1OC(=O)C. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CC(=O)CCc1c(C)c(OC(=O)C)c(C)c(C)c1OC(=O)C.

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

.RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CCOC(OCC)n1ccnc1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CCOC(OCC)n1ccnc1.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code CC1(C)O[C@@H](CC(=O)O)C(=O)O1.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value

of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CC1(C)O[C@@H](CC(=O)O)C(=O)O1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CC1(C)O[C@@H](CC(=O)O)C(=O)O1.

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CCC(=C1C(=O)CC(CC1=O)C(=O)[O-])[O-]. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CCC(=C1C(=O)CC(CC1=O)C(=O)[O-])[O-].

ABSTRACT

Abstract

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code COC(=O)CCC1=NNC(=O)NC1=O.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral

enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3].The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code COC(=O)CCC1=NNC(=O)NC1=O. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code COC(=O)CCC1=NNC(=O)NC1=O.

The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CCOC(=O)CCc1ccc(\C=C\C(=O)OCC)[nH]1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CCOC(=O)CCc1ccc(\C=C\C(=O)OCC)[nH]1.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code Cc1c(CO)sc[n+]1Cc2ccccc2.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code Cc1c(CO)sc[n+]1Cc2ccccc2. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code Cc1c(CO)sc[n+]1Cc2ccccc2.

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3].The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code NC(=O)c1ccc(NCC(=O)O)cc1. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code NC(=O)c1ccc(NCC(=O)O)cc1.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code CC(C)c1cc(OC(=O)C)c(C)cc1OCCN(C)C.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CC(C)c1cc(OC(=O)C)c(C)cc1OCCN(C)C. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CC(C)c1cc(OC(=O)C)c(C)cc1OCCN(C)C.

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used

CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CC(C)(C)c1cc(Cn2cc[nH+]c2)ccc1O. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CC(C)(C)c1cc(Cn2cc[nH+]c2)ccc1O.

ABSTRACT

"Corona virus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome" and presently, killed many people worldwide. Researchers are still struggling to find a cure. Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that may deactivate 6Y84 enzyme of corona virus was identified. A pharmacophore equivalent to caffeic acid obtained from coffee plant was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was a compound with SMILES code CC(C)(Oc1ccc(Cl)cc1)C(=O)OCC(=O)NCC(=O)O.

Keywords: Corona, Virus, Docking, Pharmacophore

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has caused the death of many people all over the world. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that still the researchers are struggling to discover a drug that can prevent corona. [2]. Countries are trying to fight through lockdown. However, that strategy has hit the economy badly. Thus, there is a significant need to develop a treatment for corona. The mankind is doing extensive research to fight back the deadly virus. The goal of the present work is to identify a pharmacophore against corona through *in silico* analysis.

MATERIALS AND METHODS

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a phytochemical that can deactivate the viral enzyme. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used CHARMm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value

of both the parameters indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with caffeic acid of coffee plant. The important enzyme of corona virus chosen was 6Y84.

RESULTS AND DISCUSSION

Table 1 shows that caffeic acid can block 6Y84 enzyme of corona virus. A pharmacophore was identified which may cure the disease by blocking the enzyme 6Y84. The pharmacophore had SMILES code CC(C)(Oc1ccc(Cl)cc1)C(=O)OCC(=O)NCC(=O)O. Positive values of "-CDOCK Energy and -CDOCK interaction energy" indicated that the pharmacophore may fight against corona virus. Further wet lab test is required to prove it. However, such analysis may reduce the number of trials. The qualitative and quantitative strengths of interactions between ligands and an enzyme is essential in drug discovery. Reliable estimation of binding interaction may improve the ligand selection. Molecular docking is usually compared to a Lock and Key process. The conformation of the ligand and enzyme does not change during binding. Ligands are often flexible and occupy multiple conformations in solution. CDOCK method considers the multiple conformations and the influence on the interaction. The result shown corresponds to the conformation that resulted in the highest value of - C DOCKER ENERGY.

CONCLUSIONS

The results suggested that caffeic acid can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound which may deactivate 6Y84 enzyme of corona virus had SMILES code CC(C)(Oc1ccc(Cl)cc1)C(=O)OCC(=O)NCC(=O)O.

ABSTRACT

This article deals with the study on the effects of aerodynamic modelling of vehicle.The investigation was carried out for the pressure, velocity, and vorticity distribution around the vehicle environment. This modelling is based upon the meshless simulation techniques and its application to find a quick and more accurate simulation for the scenario. The computational techniques should not be time taking; if it will be so, then it increases the cost of simulation. The attempt made here is to just give some idea of meshless simulation techniques for external flow over bodies.

Keywords: CFD simulation, aerodynamic body, air flow around car, techniques to solve CFD, meshless simulation.

INTRODUCTION

In today's word, we are focused of getting high speed vehicles with reduced drag forces and vortices acting on it. The drag forces reduce the capability of stability of vehicles under high speed conditions. Also, it is very essential to reduce the lift acting on the high-speed cars by proving additional surface features like spoilers.Malizia et al. investigated the CFD simulation of spoked wheel cycle [1]. Blocken et al. studied the consequences of force-drag influenced by the car due to the cycle by CFD [2]. Deckers et al. investigated the effects of fire incar parking by full scale CFD simulations [3].Fintelman et al. observed the influence of flow around the cyclist due to cross winds [4].Thabet et al. investigated the CFD simulation of a flow around the car [5].The solution setup of the 3d fluid flow surrounding the environment of a reference vehicleand the observation of the effects of forces created by the air flow on the vehicle surface. This is a typical external aerodynamic case using the virtual wind tunnel.

This case study shows how to:

- Importingthe geometry from CAD importer.

- Checking the model imported to the system.
- Virtual wind tunnel Explorer is used for the working with the log file.
- Flow variables is observed on the vehicle total surfaces.

METHODOLOGY

Geometrical modelling and steps

The modelling can be done on a variety of commercial software available in market. Then, the modelling is imported to the commercial software.
Main menu > Geometry > Import a new geometry. The Model Units window, shown in the figure below, will appear automatically.Imported geometry will be shown in the Graphic View, and it will appear as a Shape in the Geometricalcategoryin Project sub-Tree.

Model checking

(a) Orientation of the provided vehicle in the Graphical View window is checked. Here, the height is represented by the Y direction; the direction of flow is from -X to +X.
(b) Information related to the geometry can be showed by only clicking on it, right clicking on the Graphic View window and choosing in the Graphic View Menu > Show geometrical properties
(c) Dimensions of the vehicle is measured. Main Menu is pressed by selecting the geometry.>

Geometry > Dimensions or
Length is in X direction.
Height is in Y direction.
Width is in Z direction.

Keep the geometry selected and click again to hide the dimensions.
(d) Surface tessellation quality is checked. To this end: the geometry of the object is selected, then right clicked on the Graphical View window and choose Graphic View Menu > Visualization mode > Mesh

(e) Check the surface normal enabling the culling; thus, selecting the geometrical object, then right clicking on the Graphical View window and choosing Graphical View of the Menu > Back-faced culling is selected. Graphic View Menu > Reverse orientation. Eventually, leaving the normal pointing towards the exterior of the car as shown in the figure below on the right.

If the model has holes, fluid will leak inside. This fluid inside the geometry is initialised with the inlet velocity condition as the rest of the fluid but, because it is confined, generates pressure waves inside of the geometry that lead to wrong forces. Furthermore, closed volumes with a small opening will equilibrate the interior pressure to the local static pressure at the hole, leading to wrong overall forces.

Problem setup

Engine settings Project Tree > Environment > Engine:

(a) Turbulence settings > Turbulence model: Automatic
(b) Turbulence settings > Turbulence generation: Off
(c) Leave the default Advanced Options.

Environment settings Project Tree > Environment > Environment:

(a) Global attributes > Domain type: Virtual wind tunnel
(b) Global attributes > Ext. acceleration laws: leave it to zero
(c) Global attributes > Initial conditions: Wind tunnel default

When using the Wind tunnel default initial condition, software initializes the velocity field according to the inlet Velocity laws. This is a good practice for external aerodynamic simulations.
(d) Keep Reference area as Front and Reference velocity as Automatic,
(e) Wind tunnel > Lateral boundaries: Periodic. Symmetric lateral boundaries could be useful to simulate half vehicle
(f) Wind tunnel > Boundary condition: Velocity. Set a Velocity law at inlet equal to (50, 0, 0) m/s
Material settings:
Keep the default parameters of air in Project Tree > Materials.
Geometry settings:
Project Tree > Geometry > Shape-Asmo

Simulation settings

Project Tree > Simulation:
(a) Simulation time: 0.15 seconds
(b) Timing mode: Automatic in fixed.
(c) Timing step mode >Courant number: 1
(d) Resolution > Resolved scale: 0.2 metres (resolution at the far field)
(e) Resolution > Refinement algorithm: Adapt to walls and dynamically adapt to wake
(f) Resolution > Wake resolution: 0.0125 metres
(g) Resolution > Wake refinement threshold: Automatic
(h) Resolution > Shapes refinement > Shape- asmo >Target resolved scale: This represent the near wall resolution, set it equal to Wake resolution and leave Curvature adapted Off.
(i) Resolution > Regions > Refinement transition length: 3

Due to the Cartesian structure of the lattice, the choice of the different resolutions must be related by a factor 2 n, with n an integer. In this tutorial, n=4: h = 0.2/2 4 = 0.0125 m near the wall. The wake is developing only because of the flow surrounding a body; therefore, the wake resolution must be equal or greater than the near wall resolution.

(i) Store data in the Folder "asmo", with a Frames frequency of 200 Hz and Numerical data frequency to Frames frequency; this will save hard disk space although the curves in the Function Viewer will have less points than if Solver time step frequency had been chosen.

(g) Leave disabled the computation of averaged fields and markers, as long as resume file

RESULTS AND DISCUSSION

Cutting plane is created. Go to the Project Tree > Post Processing tab and:
(a) Right-click on Cutting planes > Add cutting plane or press in the Post-Processing Toolbar (b) Visualise the velocity in the cutting plane by setting: Cutting plane > Visualisation mode: 3d field, and choose the Field: Velocity
(c) Activate the interpolation mode: General > Interpolation mode: Convolution

(d) Set the velocity range to [0,60]: Main menu > Simulation data > Analysis settings or press in Toolbar Data Processing.
(e) Select the right view
(f) Press Play Note that the internal domain is initialized (frame 0) with the inlet velocity of the virtual wind tunnel.

Fig. 1 shows the velocity contour of flow around the vehicle, it can be inferred that the velocity at the front edge is low and should be eliminated. This is because of present of flat area portion near the front edge of the vehicle. Also, the velocity at the top of the vehicle is high and hence it is aerodynamically good surface.

Fig. 2 shows the pressure contour of the environment around the vehicle, and it clearly states that the pressure is high enough to create drag at high speed conditions. The pressure at the rear end is low, and hence the vehicle is not aerodynamically suitable to be operated at prescribed conditions.

The Fig. 3 shows the vorticity distribution around the environment, it clearly depicts the creation of vorticity around the frontal and rear ends of the vehicle. Therefore, it creates instability of the vehicle; and it seriously needs modification.

The Fig. 4 shows the turbulence intensity distribution around the environment of the vehicle, it clearly shows the turbulence intensity is maximum at the rear end. Therefore, the design should be considered as it may not create so much of turbulence in the front end.

CONCLUSION

The process of creation of CFD flow around the vehicle is defined;also, selection of an aerodynamic surface upon the vehicle is observed. The vehicle is to be modified on the basis of aerodynamic flow around it. There should be low turbulence in order to go for the stability of the vehicle.

ABSTRACT

The influence of various parameters such as concentration ratio and $\eta_{thermal}$ was analysed on the performance of solar trough collector in this experimental work. This paper gives a critical technological study on various types of solar thermal system. To produce electricity, Concentrated Solar Power (CSP) technologies are used widely. Among the most proven and advanced of the various CSP technologies, PTC is economically viable. To upgrade of the design and performances, modelling of these devices is an essential factor. The approach used for the thermal modelling of a PTC is to look at the realistic non-uniform solar heat flux in the azimuthal direction is introduced.

Keywords: Parabolic Trough Collector, Performance Analysis, Heat Transfer Fluid.

INTRODUCTION

The sun is at extremely at high pressure and temperature. Sun is indeed the source of all energy that we exploit for satisfying all our energy needs for wellbeing and for comfort lifestyle. Solar radiant energy is controlled using a range of recent technologies. Few examples are, solar thermal energy solar heating, photovoltaic, solar architecture, molten salt power plants and artificial photosynthesis.Every day the sun radiates large amount of energy. Utilization of solar energy is a favourable choice to find solutions to problems in the energy domain e.g.; fossil fuel exhaustion [1], global warming [2] the rising electricity consumption [3]. Solar energy has been shown to have potential to fulfil a considerable portion of the world's energy need [4]. 1.7×10^{14} kW of energy received from sun by the earth surface. 900 EJ was produced from 84 min of solar radiation. The world's energy consumption for the year 2009 is equivalent to this energy[5].

Solar collector utilises sun's irradiation and converts it to heat energy. Heat energy is converted to thermal energy with help of working fluid. As well as in domestic settings, a large number of these collectors can be combined in an array and used to generate electricity in solar thermal power plants. A solar thermal collector collects heat by absorbing sunlight [6].Solar collector is a device for power generating installations such as solar parabolic trough collector and solar towers.
According to geometrical shapes, classification of solar collectors is:-

(a) PTC (b) FPC (c) CPC

PTC Thermal analysis reveals its design criteria and heat transfer enhancement technologies. PTC consists of a parabolic reflector plate, working fluid chamber and a concentric transparent cover. [6] The transparent cover prohibits losses due to wind and the receiver tube losses from oxidation. The receiver tube is the very important component of parabolic solar panel technology. This receiver tube is embraced of an inner steel tube with discerning coating surrounded by an anti-reflective evacuated glass tube [7]. Conventional glass-to-metal seals and metal bellows are used in HCE to confirm vacuum in annular zone and assist for thermal expansion difference between the steel and glass tubes [8].The flat-plate solar collectors are and most studied technology for solar-powered domestic hot water systems. The sun heats a dark flat surface, which collects as much energy as possible, and then the energy is transferred to water, air or other fluid for further use. Black surface is absorbent of the incident solar energy. Glazing cover is a transparent layer that disseminates radiation to the absorber. It also prohibits radiative and convective heat loss from the surface. Tubes contain heating fluid to transfer the heat from the collector. Insulation covering are incorporated in sides and bottom of the collector to minimise heat losses.CPC is a concentrating collector where incident solar radiations, after reflection from the reflector, are not concentrated at a point or line [9]. It collects and focuses a larger area of sunlight onto a smaller area with minimum loss. This type of collector consists of 3 basic components: (i) receiver, (ii) cover band (iii) reflector.The receiver should have good absorbing capacity for solar radiation and should have high conductivity metals in order to conduct efficiently the absorbed heat into the heat transfer fluid [10].

METHODOLOGY

Experimental setup

The aluminium blocks are fixed in **V** shape in specified angle as shown in Fig.1. We need four similar rectangular blocks and each block is connected with each other in proper cycling process through water pipe. First, we have to take a thermos-cool sheet and cut it in round shape. The cutting sheet diameter should be same as the inner diameter of glass tube, because it has to be inserted into the glass tube.

Glass tube: The convective heat loss can be minimized by maintaining vacuum between them. The absorbed placed inside the glass tube. This tube is 60 cm length and 90 mm diameter.
Glass cover: Glue was used to fix the glass cover, half length of structure. And another half was fixed with screw. The length and breadth of glass frame were 90 cm and 60 cm respectively. The glass was fitted into the frame to make it a closed box structure. This frame is placed on the parabolic box as shown in Fig.2.

Fabrication process

Plywood, glass (flat & tube), steel sheet, iron angle, thermos-cool sheet from hardware store as per required quantity were purchased from the market. Then the plywood was cut in the workshop to a parabolic, keeping same measurement in both sides. Then the steel sheet placed between two plywood from bottom side maintains the same curve as in plywood. After completing this, the setup is required to be mounted on a stand. The stand was made

fixable by welding from iron angel. The panel and stand is mounted by not and bolt and the panel is moved towards the maximum sun intensity. This can be moved from 0-70^0 angle as per requirement. The thermos-cool sheets are cut same as glass tube inner diameter. Those sheets hold the rectangular receiver blocks in proper angle. The whole body of the panel which are made up with plywood is coated with aluminium sheet for getting the more result. This sheet is pasted by glue.

Support structure of PTC

This structure is made by 6 mm thick MS angles. The cutting was done with the help of electric iron cutter. The structure was put into a shape with the help of hammer and die. Further, they were welded together according to the design. Then the structure was fitted in the supporting structure with the help of 8 mm hexagonal type nut bolt. The mirror coated stainless steel sheet was fitted in the parabolic trough structure with help of 3 mm nut bolts. A 0.8 mm iron sheet was cut to cover both the edges of the parabolic trough structure. This sheet was attached to the parabolic trough edges. A hygrometer is used to measure the humidity and water vapour in atmosphere and soil. It is used for atmospheric temperature.

Experimental Design (Fig.3)

The experiments were carried out by adopting the following steps:

- Two parabolic shapes are created from the plywood of focal point 30 cm.
- A structure is created using two parabolic shaped plywood to hold the glass tube on a stand.
- Aluminium sheet is placed inside the structure to work as a reflector.
- Four aluminium blocks are connected internally with each other for flowing of liquid.
- Aluminium blocks are set in many angles with each other at 80, 100, 120, 140, 160, 180 degree.
- All the above equipment are taken and made a complete setup to do the experiment.
- The complete setup is placed on the roof facing towards sun for the readings.
- The various angles are set for the aluminium blocks and put inside the glass tube.
- A water pump is placed inside a bucket full of water to work as an input of our setup and then connect it with aluminium blocks through a pipe. Then we placed the outlet with other side of the glass tube and the four aluminium blocks are interconnected.
- Various readings are taken for inlet, outlet, receiver, reflector, glass tube, upper glass, ambient temperature, velocity of the air, solar radiation and humidity.
- For measuring the temperature of inlet, outlet, reflector, receiver and glass tube temperature sensor is used.

RESULTS AND DISCUSSION

From Fig.4 and 5 it can be observed that temperature at outlet, receiver block temperature and glass temperature for 120^0, 140^0 and 160^0 are in order of decreasing. This happens only due the fact that this parabolic collector has a rim angle of 120^0, so the concentrator collects and reflects the radiation in the same angle.HTF temperature & heat losses: It can be seen from Figs.6 and 7 that the outlet temperature of HTF starts increasing before 6.00 AM with glass cover case. But the temperature of HTF increases after 6.00 AM without glass cover case. Also, the HTF temperature of without glass cover ends before time as compared to with glass cover. This happens only due to fact that the convection and radiation losses are added from the receiver tube without glass cover(Fig.8).

Solar intensity: The solar intensity is same for both cases whether it is with glass cover or without glass cover .It only depends on weather conditions of a location. HTF outlet temperature: The HTF outlet temperature will be more for with glass cover case as compared to without glass cover because of the convection and radiation losses from the receiver without glass Power consumption of pump: The pump power will be more in case of with glass

cover as compared to without glass cover .This is only due to reason that the mass flow rate will be less to maintain a temperature in case of without glass cover, because less mass flow rate leads to increase in temperature of HTF.

CONCLUSION

Experimental model is developed which is based on thermodynamic analysis of parabolic trough collector. This model is based upon the minimization of radiation losses by the use of triangular cross-section, so that maximum solar radiation can be captured. Also, the use of aluminium metal blocks arrangement in series acted as a long receiver tube under compact glass cover.

ABSTRACT

This paper deals with the distribution of velocity, pressure and vortices around the cylinder. It is only a case study of how the flow is distributed around the cylinder. The cylinder is created and then it is exported to the CFD solver; the CFD solver used here uses meshless simulation techniques to solve the problem. The setup and solution of the two-dimensional flow around a cylinder at Reynolds number Red=4000.

Keywords: Flow around the cylinders, laminar flow, simulation of flow, CFD of cylinders,

INTRODUCTION

Create a cylinder Create a cylinder cantered at the origin, in the Z-direction, with radius 0.2 m and height 1.0 m, by means of: Main menu > Geometry > Create object > Create cylinder, or in Toolbar Object Creation. Introduce the geometrical data of the cylinder in the dialogue box (Units in SI):Select the cylinder geometry-object (Shape) either by: selecting the View only in the Toolbar Selection Filter, and clicking either on the cylinder in the Graphic View or on the word Shape in Project Tree > Geometry > Geometries. Once the object is selected, its wireframe is highlighted in blue. selecting the Object filter in the Toolbar Selection Filter, and clicking either on the cylinder in the Graphic View or on the word Shape in Project Tree > Geometry > Geometries. Once the object is filtered, its wireframe is highlighted in blue and the object Gizmos are automatically shown.Rinoshika et al. investigated the flow around the surface mounted short cylinder [1]. Zhang, et al. investigated the effects of the effects of flow around the equispaced four cylinders [2]. Wu et al. investigated the flow around the cylinder under high Reynolds number [3]. Dash et al. investigated the effects of flow around the vertical hollow cylinder [4]. Shi et al. investigated the effects of flow around the D shaped cylinder with an open cavity [5].

Gizmos allow the user to translate, rotate and scale the geometry. To familiarize yourself with gizmos please perform the following actions: click on any of the gizmo axes -the translation dialogue box appears - and enter X = 3 m, Y = 2 m, Z = 1 m. Observe the new position of the cylinder. click on any of the gizmo arch - the rotation dialogue box appears - and enter X = 30 º, Y = 0 º, Z =0 º. Observe the new orientation of the cylinder. click on any the gizmo axes center - the scale dialogue box appears - and enter 2. Observe the new size of the cylinder (twice the original).Make sure that OpenGL mesh deflection = 0.1. If that is not the case, please change the parameter to 0.1, delete the geometry: Select geometry > right mouse button in the Graphic View.Please note: There is no Undo option. Please, save the project frequently.Configure the section Project Tree > Environment > Engine > as follows: (a) Kernel : 2d (b) Flow model: Single phase external (c) Thermal model: Isothermal (d) Turbulence settings: Turbulence model: Automatic Turbulence generation: Off (e) Advanced options: Leave the default setup.

METHODOLOGY

Problem set-up

Environment settings Configure the section Project Tree > Environment > Environment > as follows: (a) Global attributes > Domain type: Virtual wind tunnel
(b) Global attributes > Ext. acceleration laws: leave it to zero
(c) Global attributes > Initial conditions: Wind tunnel default
(d) Global attributes > Reference area: Front
(e) Global attributes > Reference velocity: Automatic
(f) Wind tunnel > Position: move the wind tunnel 2 metres in the +X direction
(g) Wind tunnel > Dimensions: 9 metres length (X), 3 metres height (Y) and 1 metre width (Z)
(h) Wind tunnel > Ground wall: Off
(i) Wind tunnel > Boundary conditions: Velocity
(j) Wind tunnel > Boundary conditions > Velocity law: 10 m s -1 in +X direction.
This boundary condition would be applied on the -X boundary of the wind tunnel (inlet). Materials settings: By default, in single phase external the fluid material is called Gas, which is initialised with the air thermophysical properties. To get a Red=4000, given a fluid velocity of 10 m s -1 and a cylinder diameter of 0.4m, the Gas properties have to be modified as:
(a) Project Tree > Materials > Fluid >Density: 1 kg m -3
(b) Project Tree > Materials > Fluid > Viscosity model: Newtonian.
(c) Project Tree > Materials > Fluid > Viscosity model > Dynamic viscosity: 0.001 Pa s.
Geometry settings: The geometry (cylinder) has been previously created. In the Project Tree, its behaviour and boundary conditions can be defined, as follows:
(a) Project Tree > Geometry > Geometries > Shape: Cylinder > Behaviour: Fixed, leave blank position and orientation.
(b) Project Tree > Geometry > Geometries > Shape: Cylinder > Boundary conditions: Wall, with Automatic wall model and zero roughness.
Simulation settings: Configure the section Project Tree > Simulation > as follows:
(a) Simulation time: 2 seconds.
(b) Time step mode: Fixed automatic (i.e. constant time step).
(c) Time step mode > Courant: 1
(d) Resolution > Resolved scale: 0.04 metres.
(e) Resolution > Refinement algorithm: Disabled (i.e. uniform resolution).
(f) Store data > Folder: Cylinder-test1. This is the name of the folder where the numerical data will be stored.
(g) Store data > Frames frequency: 50 Hz (i.e. frames per second).
(h) Store data > Numerical data frequency: Solver time step, which means any curve plotted in the Function Viewer will be updated at the frequency of the solver steps.

(i) Store data > Save averaged fields: Off
(j) Store data > Save resume file: Off. In case you need to stop and resume your simulation you can switch it to On, however this consumes harder disk space.
(k) Store data > Compute makers: Off. The Graphical User Interface can be closed while the simulation is running. The Process Manager is the minimum interface with your computation. XFlow will reconnect the simulation to the interface by means of the Process Manager when reopening the project. A low stability parameter (< 1) means the stability of the numerical scheme is ensured and the solution should therefore be consistent. If it is very close to 0, you may increase your time step to save computation time. A stability parameter of 1 means the stability of the numerical scheme is not ensured and the simulation may diverge. You must therefore decrease your time step to ensure the convergence. The stability parameter can be monitored in the Function Viewer window. To this end, do right click on the Function Viewer window and select Stability Parameter.

Post processing technique

Create a cutting plane to visualise the velocity field, to do so please go to Project Tree > Postprocessing and do:
(a) Right-click on Cutting planes and select Add cutting plane, or press in the Post Processing Toolbar, or go to Main menu > Post-Processing > Create cutting plane.
(b) Cutting plane > Axis: Select Z (The position of the plane cannot be modified, as it is a 2d simulation)
(c) Cutting plane > Visualisation mode: 3d field.

RESULTS AND DISCUSSION

The velocity distribution around the cylinder can be seen from the Fig.1, it clearly shows that the velocity is maximum at the top and bottom of the cylinder edges. While, the velocity is minimum behind the cylinder.The pressure distribution around the cylinder can be seen from the Fig.2, it clearly shows that the pressure is minimum in the behind of cylinder. Also, fluctuation of high pressures can be seen behind the cylinder back.Fig. 3 shows the vortex distribution around the cylinder, it can be seen that the vortex is maximum at the upper and lower edge of the cylinder.Fig.4 shows the turbulence intensity distribution behind the cylinder, it can be seen that the turbulence intensity is maximum behind the cylinder and at some far distant from it.

CONCLUSION

This can be seen from the above section that the external flow through the cylinder can only be visualized by the CFD. Therefore, it can be applied to different other cylindrical objects under study and this can help to eliminate vortex of bodies in flow. Also, it gives us an idea to remove turbulence in different components under air flowing conditions.

ABSTRACT

The energy crisis is a great bottleneck in contribution of energy sources to world economy. Renewable sources are having the ability to offer energy supply for infinite period of time. Electric power generation with bio-mass resources is getting attention all over the world. Diesel and its blend along with producer gas obtained from wood chips in dual fuel mode operation of a diesel-engine may be used as a better option. The present work concentrates on the effect of producer gas flow rates and adding turbocharger on the performance of a twin cylinder dual fuel diesel-engine fuelled with diesel and producer gas. Experiments are done under different loads. Except NO_x and CO_2 emissions, reduction of HC, CO are obtained under turbocharged mode compared to its normal mode at all test conditions.

Keywords: BTE,CO,HC,Turbocharger

INTRODUCTION

Diesel engine offers better fuel to power conversion efficiency in comparison to petrol engines. Growing concern on emission & increase in the cost of petroleum products have put enormous pressure to find alternative sources of fuels as substitute for fossil fuels. So many research works are in progress to develop newer alternative fuels & technology to reduce emission & also help in cleaning up the environment [1, 2].Bedoya et al. have converted the engine to work in dual fuel with a "T" mixture & a mixing length from the intake manifold in first phase and a larger mixing length in second phase. An improved thermal efficiency was found in longer mixing length due to a better mixing of biogas-air, while a reduction in volumetric efficiency was reported due to pressure drop at the inlet manifold[3].Saha et al. performed their experiment on a single cylinder, four-stroke, water cooled diesel engine in dual fuel mode with syngas (mixture of hydrogen and carbon monoxide). A Volumetric efficiency was reduced in dual fuel operation as the inducted gaseous fuel displaces the amount of inducted air into the cylinder [4].

Yoon and Lee observed the performance of the engine with biogas in dual fuel mode. Thermal efficiency of dual fuel combustion for both pilot fuels was lower than normal diesel mode due to incomplete combustion of the gaseous fuel [5].Lakshmanan and Nagarajan changed the engine to work on dual fuel mode with acetylene as gaseous fuel. They found that acetylene injection showed inferior performance than diesel operation at part loads due to formation of lean mixture. But at full load a marginal increase in thermal efficiency was observed because of enhanced suction of gaseous fuel [6].Tippayawong et al. used a 4 stroke single cylinder engine in dual fuel mode where biogas and diesel were taken into consideration. They observed that biogas in dual fuel mode gives a higher power output, brake thermal efficiency as compared to normal diesel operation [7].Banapurmath and Tewari performed the experiment on dual fuel mode with producer gas as inducted fuel and diesel, honge oil, honge oil methyl ester as different pilot fuel. They observed highest thermal efficiency in diesel or producer gas followed by honge methyl ester (HME) or producer gas [8].The effects of gasoline fumigation were found experimentally by Sahin et al. on exhaust emissions and performance of a turbocharged indirect injection diesel engine which results in reduced effective power and increased effective efficiency [9].Gharehghani et al. conducted an experiment to investigate the thermal balance and performance of a turbocharged gas spark ignition engine. Due to increase in engine load and coolant temperature, the % of transferred energy to the exhaust gases was increased and the % of coolant energy decreased [10].

METHODOLOGY

Two different test arrangements for experimental work are conducted in the engine. Test-1 is done by utilising a 4-stroke water cooled twin cylinder diesel engine which is water cooled. The engine is connected with electrical generator and bulb loading devices. A downdraft type biomass gasifier is used for the experiment. Modification of the mentioned engine is made in to turbocharged engine with necessary arrangements. Test-2 is conducted after the necessary changes. A 2500 cc capacity TOYOTA turbocharger with pressure ratio 1.5:1 is used. The turbocharger outlet pressure is more than the engine required pressure after the turbocharger is on. The producer gas induction system experiences back pressure due to high pressure of air. As a result of which, producer gas could not enter into intake manifold. The solution of the problem is to incorporate a flow regulating valve, a y-shaped gas induction system in order to control the air flow. This arrangement gives solution to the gas induction problem as well as a stoichiometric air fuel ratio is maintained. To measure emission parameters, AVL make 5-gas analyzer is used. Under different load conditions varying from 0 to 10 kW, tests are carried out by utilising the Diesel fuel in dual fuel mode. Results are considered by using turbocharger and without using turbocharger.

RESULTS AND DISCUSSION

Brake Thermal Efficiency (BTE)

Fig 1 & 2 reveals the fluctuation of BTE with various loads for diesel in single fuel and dual fuel modes. The result showed that up to 8 kW with increase in load, BTE increases and it decreases for diesel for both modes. Proper combustion happens with rise in load as combustion temperature improves. As a result of this, BTE decreases due to poor combustion at full load condition. In turbocharged mode, BTE for the test fuel is superior than their natural aspirated mode. Due to increase in supply of air by turbocharger, the reaction of air with fuel enhances which results in better Break Thermal Efficiency.

Brake specific energy consumption (BSEC)

With increase in brake power, brake specific energy consumption decreases up to certain value. Slightly increment in brake specific energy consumption compared to turbocharger integration in single fuel mode is shown in the fig 3

and 4.This happens because with increase in brake power, combustion process becomes slow. Combustion process slows down as it gets less time for mixing of fuel-air & higher pressure of inlet air. So it leads to less input energy. As a result of which brake specific energy consumption is reduced.The reason is that turbocharger provides sufficient air for a complete combustion and BSEC decreases.

CO EMISSION

The CO emission fluctuation with loads is indicated in Fig. 5 and 6 respectively for diesel in both test modes. CO emission is reduced in turbo mode of as compared to without turbo mode for diesel in test conditions. Turbocharger gives more oxygen at inlet in full load condition. This results in better combustion indicating lower CO emission. CO emission decreases gradually with increase in brake power and at full load it increases substantially. Due to proper combustion at higher loads the result is obtained. But at full load the fuel richness causes incomplete combustion. Therefore, higher CO emission is observed.

HC EMISSION

Increase in brake power leads to decrease the HC emission to certain value & then increase in both the modes. In single fuel mode HC emission decreases more with using turbocharger, this is because more amount of O_2 is available for complete combustion & increases after that because of slow burning velocity. Hence, due to combustion of incomplete nature; and more load the oxygen percentage in the mixture decreases.In diesel engines, as compared to natural aspirated mode; the turbo operation mode leads to lower emission of HC(fig.7&8). This is only due to efficient and complete combustion of lean mixture which again is due to higher quantity air provided by turbocharger.

CO_2 EMISSION

Fig. 9 & 10 indicates that under different load conditions the emission of CO2 is found to be comparatively more for turbocharger as compared to without turbocharger. This happens because of good oxidation of CO to CO_2. Complete combustion of cylinder charge in turbo mode compared to without turbo mode is responsible for this conversion.CO_2 emission increases due to finer combustion with rise in load.

NO_x EMISSION

The change in NO_x emission at different loads for both test modes is represented in figures. With rise in load, energy input escalates, which out-turns into high combustion temperature. As a result of this, formation of higher NO_x emission is found (Fig. 11 & 12). Turbocharger provides adequate oxygen to the engine.Therefore, higher NO_x compared to natural aspirated mode in both cases of operations are found with turbo charger.

CONCLUSION

The BTE in single & dual fuel mode with turbocharger is 3.73 % & 2.76 % higher than without turbocharger engine with single fuel & dual fuel method respectively. As compared to their natural aspirated mode, the effect of turbocharger indicates a reduction in Brake specific energy consumption, an increase in NO_x emission in dual fuel operation. A decrement of NO_x emission for under test conditions is obtained. The CO_2 emission with turbocharger is higher than without it. With turbo mode, lower emission value of CO, HC are found under all test conditions.

ABSTRACT

In this modern and well equipped world every individual is interested to use articles, tools and equipments which can have numerous functionality and utilization. In this new era people are interested about modern and furnished articles. Earlier due to availability of same and less advancement of engineering world people never focused on multipurpose sources. Due to industrial growth and improvements in engineering field had made it possible to think in new direction. Previously humans are using simple table or rack for their day to activities but now in this new era and development in technologies have given thrust to develop an appliance which can solve the purpose of 3 things at a single time. These considerations motivated us to develop a project which can we used as a ladder, table and shelf. The beauty of this product is, it is space efficient, moveable, easily assembled and dismantled and more over coast efficient. It can be used in offices, Dining room, libraries etc.

Keywords: Multi Purpose Table, Catia, Ansys

INTRODUCTION

In manufacturing Engineering product design has important role in turns of it geometrical parameters like size, shape and its easiness for users. For different purpose people has to buy different product like chair for sitting, dining table for keeping food, drawing table for drawing sheets, etc. But our project is design to use a single universal table for fulfilling multiple purposes in a single product. This table would help the individual in many different way like first of all the main thing money, it is of low cost as compare to the cost of the entire thing which it will provide. So indeed it is a money saver. Other thing it is durable hence no requirement of replacement of the whole table[1,2,3].A study was conducted to realise the lifestyle, need and comfort in the Indian homes as well as different activities associated with specific interiors. Drawings were developed for final concept, and designed using Catia and analyzed using ANSYS software [4].

In India majority of Indian middle class populations are living in small flats because of their economy scale as well as the lack of space availability for living. To overcome this problem the various arrangements of the furniture should be multipurpose, space saving than their primary functions[5].Space saving furniture is one of the options to solve these problems.Introducing the innovative designs, the hard wares, the application and future development, cost & price and the important market of transformable space saving furniture[6].

In the field of manufacturing engineering product design plays a key role in turns of it geometrical like size, shape and its easiness for users. But in this paper we have to design a single universal table for fulfilling multiple purposes in a single product. Multipurpose wooden table is a table which can transform into tool, chair, comfort chair, tea table, centre table, Tea table, drawing table and dining table and this is achieve with the help of different mechanical linkages such as spring return, sliding joints ,hinges, etc. To prepare our product the type of material should be properly selected considering design, safety and strength.

1. Wood: wood is readily available in market. It is economical. It is light in weight and easily machined. Hence it is good for portability.
2. Brass: Has good mechanical properties. It is corrosion resistance.
3. Mild steel: It has high tensile strength. It is economical and available in standard sizes.

Multi-Purpose table for furnishing

A multi-purpose table for furnishing is anticipated, comprising: a top with a thickness and perimeter edges delimiting a Support Surface of the top' Supports on the underside of the top, a clearance aperture passing through the top and developing in such a way as to interrupt both the support surface and perimeter edges, a mobile element counter-profiled to the clearance aperture and aimed at re-forming the support surface and perimeter edges, and fixing means between the top and mobile element to constrain the mobile element in a removable Way in the clearance aperture.

OBJECTIVES

General objectives

1. To study the existing design of Table considering ergonomics concept: while surveying the market, we have designed a table that will consume less efforts of the human and will yield with the multiple functions in a single table. Aesthetically this project is designed, so that the individual using it will feel comfortable.
2. To study the enhancements in design and modifications in existing design: after the market survey we have accomplished a design of a table that can withstand with varieties in a single table.
3. Modelling and simulation of table design for stress Analysis: for the purpose of modelling we have used Catia software and for stress analysis we have used ANSYS-19.2.
4. Fabrication of Table : with the help of above described surveying points ,we concluded to design a table that will work with multi functionality i.e. chair, ironing table, tea table, easy chair, centre table, drawing table and dining table, it took lot of efforts to tackle the obstruction while designing this particular table.

Specific objectives

1. To plan the table structure.
2. To design different parameters related with the mechanical linkages and structure.
3. To make it available at lower cost.
4. To implement the manufacturing processes for creation of the sub-components.

5. To assemble the subcomponent and check the reliability of the creation.
6. To test the product whether it is performing the intended task.

MATERIALS AND METHODS

Project Flow

This section will explain about the flow or step involved in designing the concept. Basically, the project flow (fig.1) is as below:

I. Identify the problem statement and find the solution
II. Concept design and evaluation
III. Finalize concept
IV. Material selection
V. Fabrication process and finishing

From the flow chart below, this project starts off with literature review about the project title. After finishing the literature review, it is moved to process of identifying the problem that is being faced by the customers. Market surveys about the existing product were completed. Before coming out with concepts, objective and scope of the project was determined so that the process of concepts generation will be easier and more effective. After that, five concept designs (fig.2)were made and then the analysis was done with these concept designs. Method of concept screening is using to finalize concept. After final concept was chosen, it will be draw by using Catia software and dimension was given. After the final concept and material selection has been identified, Ansys (19.2) software is using to do analyze structure on final concept. After analyzing structure, the fabrication is proceeded to fabricate the final concept. Cutting, welding, drilling, filling and finishing process was conducted in fabrication process. After fabrication the final concept, testing process on the product was done (fig.3).

In project work we fabricated our product by the help of drilling, boring, reaming, welding, cutting the material as per required dimension and also color our product. The main raw material we used is mild steel. The other materials screw, wheel for easy transfer from one place to another, ply wood, clamp, drilling machine, welding is done by arc welding process.

Material

When we planned to make portable table cum shelf the main thing that it was analyzed which material is convenient for this product. That material should light in weight, cheaper in price; easily transfer for one place to another. For analysis all the information we are planed that mild steel is suitable for this.

Cutting of Material

When we are manufacturing our product it is bound that we have to cut the material as per our requirement. We cut mild steel for the base as it gives strength to the structure. We cut 2 piece of same size for side support and a long horizontal .Then we made 5 set of self where we have to cut 2 piece of height and2 piece of breadth of each. Then for support two side 4 supporting bar is required.

Grinding

After cutting the material with required dimension we notice that some junks are attached with our material. For removing this product some operation is required i.e.grinding.In grinding operation the rust got removed. The

grinding is done by drilling machine. Grinding tool is fitted in drilling machine. Now the material is ready for fabricated.

Boring

When the material is grinded then we finished the boring and drilling operation. We made hole in lower part for the fixing of base and wheel. Then we dilled in side supporting bar for the fixing of plate and make the product strong. Drilling is done by sane position and same distance. After drilling done we finished the drill hole by the help of boring reaming.

Welding

All the boring and grinding operation is done then we go for welding. Then we welded part of the lower part that is called base. When base is completed then we fixed the one part of each side .Then we weld the other part of side base and it is fixed with other side base. We welded the clamping .Now welded the 5 set of rack with same size with length.

Assembly

After completion, we made assembly of all the part in our lab. First we assembled the base part with the help of welding. Then we fixed the side part and place the rack size in product. After all the assembly the final product is ready.Now the product is ready after completion of all these process. Now we are going for load test. When all this completed, the final product (fig.4)is ready to go for market for selling.

CONCLUSION

Transformable space saving furniture is an innovative product. It got opportunity for future development and a huge market. Transformable space saving furniture provides small properties with greater space and multiple functions. Its designs could be combined with the structures and layouts of buildings, so that the functions of both the furniture and buildings could be maximized. In order to improve the future of transformable space furniture, its designers need to create more innovative ideas, and cooperating with architects and engineers is another way they might achieve success. Lowering overhead costs and furniture prices is another element for serious consideration.

ABSTRACT

The performance of the dryer was enhanced by the use of evacuated tubes incorporated with PCM and later on its performance was increased by transformer oil filling in the annular space between the glass and the copper tube. The performance of the dryer was seen to be in the order of Black Plate Collector Free mode, black plate collector forced mode, evacuated tube + PCM free mode, evacuated tube + PCM forced mode, oil + PCM free mode, and oil + PCM forced mode. The drying efficiency was seen to be increasing for chilli and ginger respectively. The mean peak collector efficiency for black plate, evacuated tube + PCM mode and oil + PCM mode were seen to be increasing in free convection mode and forced convection mode. Also, the temperature at desired points was seen to increase in the order of increased performance. As the dryer chamber temperature were seen to be in the increasing order of 57, 58, 62, 63, 68 and 71 for Black Plate Collector Free mode, black plate collector forced mode, evacuated tube + PCM free mode, evacuated tube + PCM forced mode, oil + PCM free mode, and oil + PCM forced mode respectively. The numbers of days are reduced from 5days to 1 and half day, where 5 days are required for black plate free mode whereas 1 and half day is required for oil +PCM forced mode. The temperature from 5pm to 6pm are seen to remain constant, this was only due to use of PCM (paraffin wax). So, on the whole the solar cabinet dryer performance was increased.

Keywords: Evacuated Tube, PCM, TES

INTRODUCTION

Solar Energy will be going to be 5th generation main energy sources with its easy availability and scarcity of non-renewable energy sources. With increasing demand of energy sources to harness our daily needs and scarcity of coal

and petroleum products it will be a better option to depend upon more reliable renewable energy sources. Various research works are going on solar energy but it still many more to be done to fully depend upon its utilization.Drying is defined as a process of moisture removal due to simultaneous heat and mass transfer. It is a classical method of food preservation, which provides longer shelf-lighter weight for transportation and small space for storage.Hossain and Bala used a mixed mode type forced convection solar tunnel drier to dry hot red and green chillies under the tropical weather conditions of Bangladesh. Moisture content of red chilli was reduced from 2.85 to 0.05 kg kg^{-1}(db.) in 20 h in solar tunnel drier and it took 32 h to reduce the moisture content to 0.09 and 0.40kg kg^{-1}(db.) in improved and conventional sun drying methods respectively. In case of green chilli, about 0.06 kg kg^{-1}(db.) moisture content was obtained from an initial moisture content of 7.6 kg kg^{-1}(db.) in 22 h in solar tunnel drier and 35 h to reach the moisture content to 0.10 and 0.70kg kg^{-1}(db.) in improved and conventional sun drying methods respectively[1].Chowdhury et al. presented an energy and exergy analysis of solar drying of jackfruit leather in solar drying of jackfruit leather in a solar tunnel dryer. Jackfruit leather was dried from an initial moisture content of about 76% (w.b.) to 11.88% moisture content (w.b.) in the solar tunnel dryer within 2 days of drying while at the same drying time the moisture content of similar sample reached 13.8% (w.b.) in the open sun drying method[2].Kaewkiew et al. investigated the performance of a large-scale greenhouse type solar dryer for drying chili. It was found that five hundred kilograms of chili with the initial moisture content of 74% (wb) were dried within 3 days while the natural sun dried needed 5 days [3].Ceylan and Ergun found out the relation between the psychometric working upon the thermo- dynamic analysis of humid air and drying at a timber dryer was investigated [4].Singh conducted an experiment on the thin layer silk cocoon drying in a forced convection type solar dyer. The cocoon was dried from the initial moisture content of about 60–12% (wb) [5].Hii et al. investigated the kinetics of heat pump drying of cocoa beans under stepwise drying conditions and the heat and mass transfer analysis was carried out using 3-D computer simulation [6].Sallam et al. used two identical prototype solar dryers (direct and indirect) having the same dimensions to dry whole mint.The values of the effective diffusivity coefficient for the mint drying ranged between $1.2\times 10^{-11}$and 1.33×10^{-11} m^2s^{-1} [7].Mette et al.performed their research in the field of long-term thermo chemical energy storage for low temperature application (e.g. solar thermal systems).). In this paper, an overview of research activities carried out at different national and international institutions related to long-term thermo chemical energy storage for solar thermal applications was studied [8].Yang et al.designeda solar air heater with offset strip fins which was optimized by numerical modelling. Results indicated that the instantaneous thermal efficiency exceeded 0.40 when the heater was running at low airflow rate(100 m3 h^{-1}) ,solar irradiance on the collecting area was 600Wm^{-2}, indoor air temperature 14°C, outdoor air temperature -5°C, and solar incidence angle20° [9].Cuypersa et al. developed a seasonal thermo chemical storage system for dwellings and offices[10].

Kumar et al. presented the results of an experimental investigation of heat transfer and friction in the flow of air in rectangular ducts having multi v-shaped rib with gap roughness on one broad wall [11].Chabane et al. investigated experimentally the thermal performance of a single pass solar air heater with five fins attached. A comparison of the results of the mass flow rates by solar collector with and without fins showed a substantial enhancement in the thermal efficiency [12].Kasperski and Nem performed the experiment on a thermo-hydraulic analysis of a solar air heater with an internal multiple-fin array. Proposed multiple fin-array technology enables to decrease the demanded air flux of 7 to10 time incomparison to the smooth pipe arrangement of the absorber. Even with the flux decreased, the efficiencyof internal multiple-fin array arrangement was higher than the one available for smooth pipe arrangement [13].Sole et al. highlighted the parameters to take into account previous to the design of thermal energy storage [14]. Neises et al. performed the experiment on thermal energy storage (TES) which will improve the efficiency and output of solar power plants [15].Block et al. presented an experimental study on the cobalt-oxide/iron-oxide binary system. Compositions of around 10% iron-oxide were identified having appropriate enthalpies and being beneficial in terms of micro structural stability [16].

Several methods have been used to improve the performance of different types of dryer with the help of investigation on various performance parameters like moisture content, drying rate, drying efficiency, collector efficiency and temperature increment at desired points. Also, different crops have been dried to see what will be the effect of drying parameters for different types of dryer used for drying purposes.

OBJECTIVES

- To analyse the performance of the solar cabinet dryerfor chilli in both free and forced mode.
- To modify, design, manufacture and analyse the performance o fsolar cabinet dryer using evacuated tubes by considering the same collector area for chilli
- To modify and analyse the performance of solar cabinet dryer with evacuated tubes for nocturnal use by using the heat storage medium.
- To analyse the performance of evacuated tubes in the solar cabinet dryer by filling the transformer oil in the annular space between the glass and copper tube.

METHODOLOGY

Experimental Setup before Modification

The schematic diagram of the experimental setup is shown in Figure 1.The solar dryer we had used in our experiment is of cabinet type solar dryer. The design of the solar dryer is based on the climatic conditions of the place, nature of the product and the quantity of the product to be dried. The indirect type of the solar dryer was designed and constructed and then it was coupled with already available solar collector. The dimension of the solar collector is 1.55 by 1.09 m. The dryer is of 0.6m height from the ground, the inlet ambient air enters through the inlet of the collector of square cross-section having dimension of 12cm by 12cm. After that the inlet air is heated up with the help of solar air collector and the outlet is connected to the solar dryer inlet, where the hot heated-up air carries out the moisture content of the product to be dried and the extra moisture carried by the air is then thrown by the outlet of the drier. The electric blower used here have a capacity of 379W, as already mentioned the capacity of the drier is of 2kg of raw product. Matt black paint is used on the absorber plate to increase the absorptivity to solar radiation. The collectors were oriented due south at an angle of 45°. A 1000W auxiliary heater was constructed from a galvanized steel sheet with a square cross section area that had a slide length of 0.27m; heating filament was wrapped on ceramic isolators. A constant variable resistance is provided to control the output power required to provide the selected air inlet temperature to the drying chamber. The power is calculated from the reading of the voltage provided by the variac and the amperage read by a digital multimeter (type ID-1000, range: 0-30 A and accuracy 0.75). An aluminum drying chamber, which had the dimension of 1.05 ×0.5 ×0.9m (length × width × height) was insulated from the outside by a 30-mm aluminum coated rock wool sheet. 8 numbers of trays are inserted in the dryer. The drying of the materials involve the migration of water from the inner of the material to its surface, and then removal of the water from the surface; which in turns requires an equivalent of latent heat of evaporation of water.

Dryer Modification

The dryer was modified by implanting evacuated tube above the black plate collector (fig.2) incorporating with PCM (Paraffin Wax) as the heat storage medium behind the black plate. This in turn has increased the performance of the dryer. After that, oil was filled in the annular space between the copper and the glass tube by mixing it with carbon graduals. The mixture was a semi solid type of slug which acts as a conducting medium between glass and copper tube. The performance of the dryer was seen to be increased surprisingly.

Solar Cabinet Dryer Observation Procedure

Step- 1: About 2 Kg of sample weight of chilli or ginger was taken from the local market of Bhubaneswar having the initial moisture content of 88.5-90%.
Step- 2: The sample was placed in the trays of the dryer and its door was closed properly.
Step- 3: The thermocouples was attached at all the desired points where the temperature was required to be measured; such as inlet to the collector, outlet of the collector, inlet to the dryer, dryer inlet temperatures (lower shelf temperature, upper shelf temperature and mean temperature of the dryer), collector plate temperature and the ambient temperature. The temperature was measured from 8 in the morning to 6 in the evening for an interval of an hour.
Step-4: The anemometer was used to measure the velocity of wind at the inlet for both in case of free and forced modes. Also solar power meter was used to measure solar intensity simultaneously for each and every reading that was taken for the measurement of temperature and wind speeds. Also, hygrometer was used for the measurement of humidity both at the inlet of the dryer and to its outlet.
Step-5: After each interval of an hour weight of the sample was measured and from back calculation moisture contained during each interval of an hour was calculated.
Step-6: The readings were taken for both natural and forced mode.

RESULTS AND DISCUSSION

Variation of Moisture Content with time

The graph of Fig.5.2 & Fig.5.3 shows the rate of decrease of moisture content for different modified and unmodified modes of the dryer. As the graph is seen steeper from black plate free, black plate forced, evacuated tube with PCM free, evacuated tube with PCM forced to oil with PCM free and oil with PCM forced respectively, it is cleared that the rate of decrease of moisture content of the sample is higher for oil with PCM forced and is lowest for the black plate free mode,the moisture content was reduced from about 88.5 to 7 %. This is only due to reason of high heat addition which in turn increases the drying chamber temperature, which leads to increase in moisture removal rate respective consequent cases.

Variation of Drying Rate with time

In this graph of Fig.5.4& Fig.5.5the drying rate was seen to be higher for oil with PCM forced and will be seen to be decreased to black plate free mode. The drying rates for the case of chilli for different cases were seen to be in the range of 12.4 kg/ hr, 13.55 kg/ hr, 15.45 kg/ hr, 17.9 kg/hr, 24.35 kg/ hr, and 35.4 kg/hr respectively; whereas for the case of ginger it was seen to be in the order of 14.05 kg/ hr, 14.6 kg/ hr, 15.3 kg/ hr, 18.05 kg/ hr, 28.5 kg/ hr and 40.15 kg/ hr for consequent cases. This was only due to reason of high heat addition to the drying chamber, which in turn had increased its temperature and hence the efficiency. Latter on the bars were seen to be staggered and modulated upon one another, this is due to the fact that at the latter stage of drying there will be very less moisture content in the drying sample and for that there will be almost no or very little differences in the drying efficiency of the dryer for different modes. This is because, for very less moisture content within the sample all the modified and unmodified versions have almost no effect on the drying rate.

Variation of Drying Efficiency with time

The graph of Fig.5.6 & Fig.5.7below shows that the efficiency of the oil with PCM forced mode version of the dryer is the highest and it goes decreased to black plate free version.The performance of the dryer was seen to be in the order of Black Plate Collector Free mode, black plate collector forced mode, evacuated tube with PCM free mode, evacuated tube with PCM forced mode, oil with PCM free mode, and oil with PCM forced mode. The drying efficiency was seen to be in the order of 25.52%, 27.88%, 31.78%, 36.83%, 50.102% and 72.838%respectively for

chilli; where as in case of ginger it was observed in the order of 28.90%, 27.05%, 31.48%, 37.139%, 58.64% and 82.611% respectively.This was only due to reason of the fact that the conversion of energy from solar intensity to heat had been improved in the consequent cases. At the latter stage the curves are seen to be staggered and cover one upon the other, this happens due to the fact that at that stage the moisture content of the sample was so low that it doesn't matters over an interval of an hour for the increased in efficiency. This is because at the latter stage almost maximum % of the moisture has been evaporated.

Variation of Collector Efficiency with solar shine hours

The collector efficiency of the dryer was seen from the graph Fig.5.8 to be higher for in case of oil with PCM forced mode and it goes on decreased for black plate free mode. The mean peak collector efficiency for black plate, evacuated tube with PCM mode and oil with PCM mode were seen to be in the increasing order of 8%, 9.15% and 10.467% respectively in free convection mode; where as it was seen to be in the order of 22.47%, 25.34% and 29.451% respectively in forced convection mode. The graph is seen to be monotonically increased up to 1 pm in noon and goes to monotonically decreased up to 6 pm in the evening, this happens only due to reason that solar intensity of the radiation goes on increasing from 8 am in the morning to the noon and is highest at 1 pm in the noon and again then goes decreased to 6 pm in the evening.

Temperature Variation at Desired Points

The given figures of temperature variation show the various temperatures at the desired points in the dryer. Ambient temperature is the lowest and the collector plate temperature is the highest. The temperature at desired points was seen to increase in the order of increased performances. As the dryer chamber temperature were seen to be in the increasing order of 57℃, 58℃, 62℃, 63℃, 68℃ and 71℃ for black plate collector free mode, black plate collector forced mode, evacuated tube with PCM free mode, evacuated tube with PCM forced mode, oil with PCM free mode, and oil with PCM forced mode respectively. In the six above temperature graphs we can see that the temperature at the desired points will going to be increased for its each modified version, that means the temperature curves are seen to be increased from black plate free to forced then to evacuated tube free and then to forced and subsequently to oil free to its forced version.The only reason to above statement is due to increase in drying efficiency, the conversion of radiant energy to heat energy had been increased which is a clear sign of increase in temperature at desired points for the consequent cases. From Fig.5.10 to Fig.5.14 we can see that the temperature at the desired points are remained to be almost constant from 5 pm to 6 pm and this was due to PCM used that tried to maintain constant temperature after the sunset.

Variation ofHumidity at Desired Points

The Fig.5.15 shows that relative humidity at outlet is greater than relative humidity at inlet; this is due to the fact that moisture addition to the inlet humidity occurs inside the drying chamber. Also, the humidity at outlet for different consequent cases such as black plate free mode, black plate forced mode, evacuated tube with PCM free mode, evacuated tube with PCM forced mode, oil with PCM free mode and oil with PCM forced mode were seen to be increased at each instant of time, as 65.9%, 75.4%, 77%, 81%, 84%, 86% and 88% at 10 am respectively. This was only due to high moisture removal rate for consequent modified cases, as there had been an increase in the moisture content of air inside the drying chamber due to higher efficiency of the dryer.

CONCLUSIONS

The dryer was modified by keeping the collector area constant andthen implanting evacuated tube above the black plate collector incorporating with PCM(Paraffin Wax) as the heat storage medium behind the black plate. This in turn has increased the performance of the dryer. After that, oil was filled in the annular space between the copper

and the glass tube by mixing it with carbon graduals. The mixture was a semi solid type of slug which acts as a conducting medium between glass and copper tube. The performance of the dryer was seen to be increased surprisingly.

- The performance of the dryer was enhanced by the use of evacuated tubes incorporated with PCM and latter on its performance was increased by transformer oil filling in the annular space between the glass and the copper tube.
- The drying rate was seen to be higher for oil with PCM forced and will be seen to be decreased to black plate free mode. The drying rates for the case of chilli for different cases were seen to be in the range of 12.4 kg/ hr, 13.55 kg/ hr, 15.45 kg/ hr, 17.9 kg/hr, 24.35 kg/ hr, and 35.4 kg/hr respectively.
- The performance of the dryer was seen to be in the order of Black Plate Collector Free mode, black plate collector forced mode, evacuated tube with PCM free mode, evacuated tube with PCM forced mode, oil with PCM free mode, and oil withPCM forced mode.The drying efficiency was seen to be in the order of 25.52%, 27.88%, 31.78%, 36.83%, 50.102% and 72.838 respectively for chilli; where as in case of ginger it was observed in the order of 28.90, 27.05, 31.48, 37.139, 58.64 and 82.611 respectively.
- The mean peak collector efficiency for black plate, evacuated tube with PCM mode and oil with PCM mode were seen to be in the increasing order of 8%, 9.15% and 10.467% respectively in free convection mode; where as it was seen to be in the order of 22.47%, 25.34% and 29.451% respectively in forced convection mode.
- Also, the temperature at desired points was seen to increase in the order of increased performance.As the dryer chamber temperature were seen to be in the increasing order of 57, 58, 62, 63, 68 and 71 for Black Plate Collector Free mode, black plate collector forced mode, evacuated tube with PCM free mode, evacuated tube with PCM forced mode, oil with PCM free mode, and oil with PCM forced mode respectively.
- The humidity at outlet for different consequent cases such as black plate free mode, black plate forced mode, evacuated tube with PCM free mode, evacuated tube with PCM forced mode, oil with PCM free mode and oil with PCM forced mode were seen to be increased at each instant of time, as 65.9%, 75.4%, 77%, 81%, 84%, 86% and 88% at 10 am respectively.
- The numbers of days are reduced from 5days to 1 and half day, where 5 days are required for black plate free mode where as 1 and half day is required for oil with PCM forced mode.
- The temperature from 5pm to 6pm are seen to remain constant, this was only due to use of PCM (paraffin wax).

ABSTRACT

This article deals with the study of wind turbine under natural wind conditions. It shows the variation of various parameters like velocity, pressure and vorticity with normal wind speed. It is important to get the effect of these parameters in the designing of wind turbines. Because, if there will be any defect in the structure then it will be a great trouble during its operation. Also, drag and lift are necessary to check for the aerodynamic performance of the wind turbines.

Keywords: CFD simulation of wind turbine, aerodynamic body of blades, air flow around vertical wind turbine, processes to solve CFD, meshless simulation.

INTRODUCTION

Rezaeiha et al. proposed the accuracy of turbulence models for the vertical wind axis turbines [1]. Oggiano investigated about the NTNU wind turbines and also have compared its effectiveness with experimental results [2]. Arshad et al. proposed a simplified design approach for high speed wind turbines [3]. Giahi et al. investigated about the effects of dimensional scale on wind turbine using CFD [4]. Goh et al. tested savonius wind turbines with a bluff body [5]. Liu et al. investigated about the creation of equilibrium marine atmosphere for off shore wind turbines [6]. Quallen et al. investigated about the floating off shore wind turbine with variable controller arrangement [7]. Wong et al. investigated about the flat plate deflector for a vertical axis wind turbine [8].
Import the CAD file blades.
(a) Importing the CAD file bladesto the software, which is in parametric IGES format.
(b) Graphic View Menu, then choose: Visualisation mode > Mesh
(c) Graphic View Menu and choose: Show geometrical properties). Observe that it has around 7900 polygons

METHODOLOGY

Problem set-up

If the geometry has holes, fluid will leak inside and it will be initialised with the inlet velocity condition as the rest of the fluid but, because it is confined, generates pressure waves inside of the geometry that lead to wrong forces. Furthermore, closed volumes with a small opening will equilibrate the interior pressure to the local static pressure at the hole, leading to wrong overall forces.

Solution technique

Import the geometry

The geometry used in Step 1 will not be used anymore in this tutorial. Now import the geometry files:
Engine settings
(a) Select the 3d Kernel, Single phase external as Flow model and Isothermal in Thermal model.
(b) Leave the default Turbulence settings.
(c) Expand the Advanced Options and switch On the Acoustic analysis.

Material settings keep the default parameters of Gas, which by default correspond to those of air. Note that there is an additional option related to the acoustics analysis: Enable bulk viscosity; switch it on. Set the same vale for the Volume bulk viscosity than that of the dynamic viscosity, namely 1.7894e-05 Pas.

Simulation settings

(a) Set 0.5 metres as target resolution for the wake, tower and blades (Wake resolution; Shape blades: Target resolved scale; Shape-tower: Target resolved scale) (b) Store data with a Frames frequency of 25 Hz and set the Numerical data frequency to Solver time step. This allows to study in the frequency domain with the solver time step frequency but only save the data at a frequency of 25 Hz. (c) Set the Store data > Folder: Wind-Turbine (d) Leave Save averaged fields and Compute markers disabled.The Probes are working in the same way as the Sensors (used in the Tutorial 04 for example). The difference is that the Probes need to be defined before running the calculation to be accessible in the Function Viewer, but then software does not need to refresh every frame to load the data as with the Sensors. Therefore, this allows you to save time for post-processing when you know in advance where to probe, and furthermore the probes can measure the information at the solver time step instead of the frames frequency as for the sensors.

RESULTS AND DISCUSSION

Fig.1 shows the velocity contours of wind turbine; it clearly shows that the velocity is maximum at the blade portion than as compared to its rear portion. The maximum attainable velocity is 6 m/s, and it is sufficient to rotate the turbine blades.Fig. 2 shows the total pressure distribution on the surface of wind turbine blades. The pressure distribution on the frontal area is less, and this shows that the turbine blades are aerodynamic. Therefore, the wind turbine blades are suitable to be operated in normal wind conditions.Fig. 3 shows the vorticity contour of wind turbine, it clearly shows that the vorticity on the nacelle of wind turbine is high and can lead to instability of the wind turbine under normal wind conditions. Therefore, this part needs modification; so, that the vorticity can be reduced. Fig. 4 shows the turbulence intensity contour of wind turbine; it clearly indicates that the rear portion the nacelle is unstable due to high turbulence. This is only due to long rear end of the nacelle of the wind turbine, and it should be modified.

CONCLUSION

Therefore, it can be concluded that before going for the assembly or production of wind turbine; it should be checked whether it is aerodynamic or not. Also, there should not be any turbulence in the air flow past the wind turbine; otherwise it may create problem during the operation of the wind turbine.

ABSTRACT

Cyber security's importance is on the rise. Our world relies on technologies more than ever before. Government, military, organizations, financial institutions, universities and other businesses collect, process and store a large amount of information on computers. This trend is growing faster every day. As computers become a major source of information, they need to be protected. Every day a new type of cyber-attack came into an act which makes digital data more vulnerable day by day. Cybersecurity is the practice of ensuring the integrity, confidentiality, and availability (ICA) of information. It requires a broad variety of resources to secure networks, computers, services and data against threats or non-authorized entry, which encompasses best practices for risk control techniques and technologies. In this paper, we will address generations of cyberattacks, attacker strategy, and biggest cyber -attacks in India. The statistical data of cyber-attacks and security will be discussed. The paper will also clarify emerging concepts of information technology and potential protection developments. In this article, intelligent protection strategies will be clarified to secure information from multiple intruders.

Keywords: Confidential data, Cyber-attacks, cybercrimes, Cyber Security, Defense, Hackers

INTRODUCTION

Cyber protection requires technologies, processes and acts to prevent interference, intrusion or unwanted access to networks, equipment, facilities and documents. This involves data storage. It may also be considered protection in the area of information technology. It is important, as states, businesses, and financial institutions and medical organizations gather, process and store data on computers and other tools without precedent. Sensitive details, be it intellectual possession, financial records, personal information or some other records category that could have adverse impacts on unwanted entry or disclosure, may be a major part of this database. The corporation that transmits sensitive data through networks and other instruments in the market sense determines the discipline of

information management, and the processes that are used to administer and retain it. As cyber threats are increasing in scale and scope, businesses and institutions, in particular those responsible for safeguarding public protection, health and financial data, have to take action to secure their confidential details for company and workers. Cybercrime is one of the world's largest and one of the biggest risks to any organization. The impact on society is reflected in the numbers.Cyber protection firms estimate the worldwide expense of cybercrime to $6 trillion by 2021 . This reflects the largest global capital transition in history, threatens opportunities for creativity and production and would be more lucrative than the entire international trade in all big illegal substances. The cost estimates of damage are based on historical statistics of cybercrime including recent year-over-year growth, a dramatic rise in the hostile nation-state and gangs-hacking activities, and a greater cyber-attack surface by 2021. Cybercrimes involve harm, devastation, burglary, stealing of profitability, intellectual property, burglary of personal and financial data, embezzlement, fraud, normal-term post-attack intrusion, forensic analysis, repair and erase hacked and reputational abuse.

India, with over 560 million internet users, ranks just behind China, is the second largest online platform in the world. According to Internet and Mobile Association of India (IAMAI) [1,2], more than 600 million internet users are projected in India by 2021. In 2015 just 17% of Indians were able to use the internet. There were 483 million internet users in India in 2018. In 2023, 666.4 million internet users will be registered, according to the study [3]. It will lift the figure. Because of its untapped potential, India is the world's second largest online sector. The bulk of internet users in India are cell phones internet users who allow the most practical alternatives to the costly hardware that desktops and networks require. As of 2016, India's mobile Internet usage figures is 320.57 million and Indian Internet users estimated 492.68 million by 2022. 390.9 million users were able to navigate the internet via cell phone in 2018. The number will hit 500.9 million internet users in 2023 [3]. This amount is anticipated.

LITERATURE REVIEW

Any significant violation of information security will collapse and destroy the credibility of an entire organization. Cybersecurity risks are not just a problem of major corporations, such as banks, software firms, and state departments, but also the obligation of any other citizen involved with their records. The rate of cyber-crimes is increasing day by day and therefore the analysis of information security statistics and patterns in past years is necessary for us to understand the diabolistic and illegal forms in which data abuses arise and take steps to be secured.

2017

For cybercrimes,2017 was a high year. The number of cyber-safe accidents has almost doubled from 2016 according to the Online Confidence Alliance [4]. This huge spike, from approximately 82,000 accidents in 2016 to approximately 160,000 in 2017, has been credited in the "2017 Cyber Report" [5]. The eye-catching figures of cybercrime in 2017 were further helped by high-profile ransomware attacks like WannaCry and NotPetya. The estimated expense of a violation was $3,62 million in 2017, according to the Ponemon Instituteand IBM's 2017 "Expense of Data Breaching Report" [6]. The most troubling evidence cited in this study were that, with the implementation of public management practices such as patching apps and performing phishing instruction, 93% of accidents may have been stopped. Although 52% of infringements culminated in "real hacking," 15% were induced by lack of safety devices, 11% were triggered by inadequate internal danger control and 8% by phishing, respectively [5].

2018

The biggest DDoS attack ever reported was endured by GitHub [7] in 2018. The assault culminated in 1.3 terabits of GitHub traffic for a second. A team of security experts from Security Research Labs took to the Hack in the Box

security conference to reveal their project: two years in the reverse engineering phase of the operating systems of Android phones, which showed that some handset makers withhold security fixes from users. With fines of up to 20 million [8] or up to 4% of the annual worldwide turnover for those companies caught mishandling user data, GDPR promised to usher in a new age for the processing of personal data.

2019

In 2019, the cyber technology industry grew by 8.7%and the money invested on data management, rules and data privacy law enforcement tools was $124 billion [9,10]. Around 94%of targeted emails use the payload or malware root to add harmful data. 91% of cyber attacks start with a "spear-phishing" text, an increasingly popular type of phishing that allows more precise and personal use of knowledge regarding a target [11]. Billions of dollars of damage is triggered by cybercrimes, as per analysis by Juniper, the figure reached $2 trillion by 2019 [12].

CYBER ATTACK GENERATIONS

The Ist Generation: In the late 1980s, hackers mounted virus attacks on standalone PCs, typically propagated via disks. The affected private users and companies contributed to the creation of anti-virus (AV) products focused on signature info.Examples of first-generation assaults are:

- Elk Cloner (1982): the first computer virus in the world.
- Brain (1986): booting attack.

The IInd Generation: In the mid-1990s, quickly expanding worm attacks emerged straight from the omnipresent Internet, which forced businesses to build a firewall at the infrastructure's periphery to keep the bad people out.Examples of IInd generation attacks include:

- The Morris Worm (1988): One of the first computer worms, leading to the US first felony conviction under the Computer Fraud and Abuse Act.
- Melissa (1999): A mass mailing macro virus.

The IIIrd Generation: During the first years of the new century, criminals began exploiting bugs during software that could impact the businesses exploiting them. That is also about the period when the purpose of the offender switches from appreciation to remuneration. Initially, the botnet was used, particularly for the spam distribution. This attack generation contributes to the creation of IDS systems, which soon incorporated correction capability and became Intrusion prevention systems. Signatures were already based on IDS / IPS.Examples of assaults from the third century include:

- ILOVEYOU (2000): A worm infecting tens of millions of Windows machines.
- SQL Slammer (2003): Denial of service on 75,000 hosts.

The IV Generation: During the early part of the last decade, there were no signs of the emergence in targeted attacks. During a conversation on the absence of clear evidence regarding weapons of mass destruction, citizens were prompted to follow the word "hidden unknowns" invented by then American defence secretary Donald Rumsfeld. Malware application consistency increases and the first rootkit starts to pop up.Types of threats from the fourth generation include:

- Stuxnet (2005-10): State-sponsored development, targeting SCADA systems in critical infrastructure, including the Iranian nuclear program.
- The Target Breach (2013): Not a virus or worm, but a targeted attack on the clothing retailer. The details of 40- 70 million credit cards stolen, 110 million people's personal information breached.
- The DYN Attack (2016): Not a virus or worm, but a massive distributed denial of service (DDOS) attack on the major DNS provider.

The Vth Generation: A wide-ranging mega-attacks funded by the government began in 2017 so that several businesses may execute them. Cybercrime has its internet and escrow networks. There's a busy null-day market. Examples of assaults from the Vth wave are:

- WannaCry (2017): Major ransomware attack affecting 200,000 computers across 150 countries.
- Petya and NotPetya (2016-17): Variance of ransomware used against machines across Europe

BIGGEST CYBER ATTACKS IN INDIA

SIM Swap Fraud

In August 2018, Navi Mumbai arrested two men for cybercrime. They participated in fraudulent practices with regard to the money transfer from the accounts of a variety of people, unlawfully collecting details on the SIM card. This fraudsters obtained details from citizens and prevented the usage of false documents on their SIM cards. They had to transfer four Indian Rupees out of different accounts successfully. We also went to access a few corporations' profiles [13].

Cyber Attack on Cosmos Bank

The Cosmos Bank's Pune branch was targeted in August 2018 by a brazen cyber assault, which saw the loss of almost 94 Crores rupees. By breaching the Cosmos Bank's computer, In Hong Kong, Hackers cleaned out and passed the funds to a trust. The lawsuit was put before Cosmos Bank with a Pune court of cyber assault. Hackers hacked into the bank's ATM network and stole many details from owners of visas and debit cards. The assault did not go against the cohesive banking solution of Cosmos Bank. The deposits and balance sheets remain unchanged and have little impact on the financial statements of the owner. The switching process was built to function as the node of communication between the payment portals and the bank's central banking solution. The malware assault on the switching network created many false alerts that verified many external demands for visas and debit cards. In 28 nations, there were 14,000 sales, more than 450 tickets. 400 cards and 2,800 transactions were used at the state level. This was the first malware assault to break up the link between the payment gateway and the Indian bank [13].

ATM System Hacked in Kolkata

Fraudsters pirated in July 2018 and wiped off almost 20 lakh rupees of different banks' accounts on ATM servers at Canara Branch. More than 50 people were killed and over 300 ATM customers were accused of providing account data in India. Hackers used skimming machine on ATMs to capture debit cardholders' data to execute a minimum purchase of INR 10,000 and an INR cap of 40,000. Two people who collaborated for a foreign group used skimming operations to collect bank data were arrested on 5 August 2018 in New Delhi[13].

Websites Hacked

Between April 2017 and January 2018, more than 22,000 websites have been compromised. The Indian Cyber Emergency Response Team's figures indicate that over 493 pages, including 114 government-owned websites, were compromised with malware spreads. The attacks were to gather information about users on the network infrastructure and device data[13].

FUTURE OF CYBER ATTACKS (Fig.1)

The cybercrime industry has risen with the economic growth of at least $1.5 trillion annually. It is projected to hit $300 billion by 2024 for the cyber-security sector. In 2021, it is estimated that 70% of all purchases for crypto-currencies would be for illicit activity. Cyber-crime costs are estimated at 6 trillion dollars globally by 2021 for corporations and organizations. The loss reported being 20 billion dollars in Ransomware worldwide. An organization's total cybercriminal loss is projected to be 13 million dollars annually [14,15].In the near-decade, there are a variety of big cyber threats. Attacks against IoT would be 34%. A maximum of 98% of IoT computer traffic is authenticated, exposing network data that is sensitive and private. 28% of sensitive infrastructure threats and 20% of devices would be targeted [14]. Using a smartphone and other media, attackers attempted to pass on confidential details to citizens. Such assaults are recognized as virtual infrastructure and will carry 6% of assaults in the future. There are also ongoing advances in cloud infrastructure, which have several bugs that cyber attackers or malicious insiders may use.

DESIGNING FUTURE TECHNOLOGIES WITH SECURITY (Fig.2)

The design of future technologies must provide security. Adding protection afterwards is not enough or viable anymore. Innovation in defence will have more efficient and insightful approaches to face threats. For cooperation and advancement of adoptions, networks and safety requirements must be available. Throughout the design and implementation of their goods, security and protection suppliers must be assured. To avoid compromise and render safety clear to the user, goods and services must be solid. For both parties and systems in the digital world, encryption needs to secure data while it is accessible or used.

SMART SECURITY SOLUTIONS (Fig.3)

Today, all our critical systems are interconnected and computer-driven. The digital and Internet of Things (IoT), Artificial Intelligence (AI) and Big Data and cloud storage etc. would be more relevant to day-to-day tasks and decisions.Such tools have a significant impact on their degree of weakness, relations and complexities.In the future, cyber-attack based technology for Protection and Offensive can be built by organizations. The cybercriminals and hacktivists will try to utilize cyber-technology to transmit their message and raise revenue and violence in the tribunal.To order to contend with cyber threats and to secure records, particular information defence platforms and technology would need to be more mature and more complex. Defence systems need to be linked in such a way that they may function in real-time. Human will not be able to handle all information attacks so in future the dependency on AI will increase. Also, there is a need to cultivate next generation and advanced cyber experts who will know how to drive and develop those systems. We need a stronger protection approach to secure our infrastructure, technologies and knowledge.For now, hacking has become the number one cause of the intrusion, accompanied by ransomware, intruder and outsider agents and unintentional violations. The number of attacks which lead to device failure and data loss continues to grow.Tougher privacy and other legislation related to cybercrime will be implemented to determine and prosecute criminals and avoid cyber-attacks.

This is claimed that what hackers and criminals would be seeking would decide the future of information protection. And it will mostly be the health-related information and also the wealth like credit card and other financial information. For these regions, data defence should then be stronger because the information is the most valuable commodity.The security departments have traditionally been focused on on-site applications but now Azure, cloud with AWS, and SaaS software can be included, causing other critical details to be compromised or breached.Capable computer frameworks must be implemented that can track, identify and handle cyber-attacks and deter them in real-time.

CONCLUSION

The defense of our classified documents, personally identifying details (PIIs), secure health records, financial knowledge, intellectual property, technology and computer networks against intrusion and undermining attempts by offenders and opponents is an essential part in cybersecurity. Cyber threats from every organization's level can arrive.It was becoming really important to warn people about social manipulation schemes like phishing and more sophisticated computer security threats, such as ransomware (such as WannaCry, NotPetya). In this article, we have discussed the drastic increase in the number of internet users in the last few years with the biggest cyber-attacks that took place in India. The generations of various cyber-attacks give us a clear view of how cyber-attacks technologies upgraded from the very beginning.We have also discussed how cyber-attacks will affect us economicallyin the upcoming future and counter technologies to overcome all those cyber-attacks. Smart security solutions are suggested to tackle them.

ABSTRACT

"Coronavirus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome". Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that can deactivate 6VXS enzyme of corona virus was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was Nc1ccc(Nc2ccccc2)cc1 (SMILES).

Keywords: Corona, Virus, Docking, Biovia

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has shaken the whole world by killing many people. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that there is no drug discovered. [2] The mankind is doing research to develop new medicines. The objective of the present work is to identify a medicine against corona.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a ligand. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used Charmm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with Apigenin of Passion-flower plant. The important enzyme of corona virus chosen was 6VXS.

RESULTS AND DISCUSSION

Table 1 shows that Apigenin can block 6VXS enzyme of corona virus. A compound was found to be capable of curing the disease by blocking the enzyme had SMILES value Nc1ccc(Nc2ccccc2)cc1.

CONCLUSIONS

The results suggested that Apigenin can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound capable of deactivating 6VXS enzyme had SMILES value Nc1ccc(Nc2ccccc2)cc1.

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has shaken the whole world by killing many people. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that there is no drug discovered. [2] The mankind is doing research to develop new medicines. The objective of the present work is to identify a medicine against corona.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a ligand. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used Charmm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value indicated blocking of active site of viral enzyme [3]. The pharmacophore that was identified had similarity in structure with Apigenin of Passion-flower plant. The important enzyme of corona virus chosen was 6VXS.

RESULTS AND DISCUSSION

Table 1 shows that Apigenin can block 6VXS enzyme of corona virus. A compound was found to be capable of curing the disease by blocking the enzyme had SMILES value Cc1cc(C)c(CC(=O)O)c(C)c1.

CONCLUSIONS

The results suggested that Apigenin can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound capable of deactivating 6VXS enzyme had SMILES value Cc1cc(C)c(CC(=O)O)c(C)c1.

ABSTRACT

"Coronavirus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome". Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that can deactivate 6VXS enzyme of corona virus was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was Cc1ccc(O)c(c1)C(=O)NO (SMILES).

Keywords: Corona, Virus, Docking, Biovia

INTRODUCTION

"Coronavirus disease 2019 (COVID-19)" causes "severe acute respiratory syndrome". Pharmacophore analysis followed by molecular docking utilizing "Biovia Discovery studio" were done and the chemical that can deactivate 6VXS enzyme of corona virus was identified. Based on positive values of "-CDocker energy as well as -CDocker interaction energy" the drug identified was COC(=O)[C@H](CC(=O)O)C(C)C (SMILES).

Keywords: Corona, Virus, Docking, Biovia

INTRODUCTION

"Corona virus disease 2019 (COVID-19)" has shaken the whole world by killing many people. [1] A new species of corona named as "COVID-19" caused this attack. The issue is that there is no drug discovered. [2] The mankind is doing research to develop new medicines. The objective of the present work is to identify a medicine against corona.

METHODOLOGY

"Biovia Discovery studio CDOCK and Pharmacophore" menu ("Dassault Systemes, France") were utilized. Pharmacophore menu was used to identify a molecule similar to a ligand. Then CDOCK operation was done between an enzyme of the virus and the ligand. The CDOCK menu used Charmm protocol for docking and gave the "-CDOCK Energy and -CDOCK interaction energy". A positive value indicated blocking of active site of viral enzyme [3].The pharmacophore that was identified had similarity in structure with Apigenin of Passion-flower plant. The important enzyme of corona virus chosen was 6VXS.

RESULTS AND DISCUSSION

Table 1 shows that Apigenin can block 6VXS enzyme of corona virus. A compound was found to be capable of curing the disease by blocking the enzyme had SMILES value COC(=O)[C@H](CC(=O)O)C(C)C.

CONCLUSIONS

The results suggested that Apigenin can fight against corona virus. "Discovery Studio pharmacophore and Cdock module of Biovia software" suggested that the compound capable of deactivating 6VXS enzyme had SMILES value COC(=O)[C@H](CC(=O)O)C(C)C.

ABSTRACT

Here, we aimed to determine the nitrate-nitrogen ion of the community based ponds in order to validate the suitability of the pond for aquaculture practices. Nitrate-nitrogen ion concentration was measured across three different ponds and finally fish farming was initiated. The nitrate-nitrogen was found to be between 1.76 and 7.95 mg-l^{-1}. This study primarily focuses on making use of unexploited ponds present in the community aiming for introducing fish farming, resulting in an increment in the local economy.

Key words: Community, aquaculture, fish, nitrate-nitrogen, ponds.

INTRODUCTION

With an ever increasing food demand, contribution of fish farming is significant. Water is considered to be a vital natural resource and a critical agricultural input (Huang et al., 2015). Water usage is essential for sustainable agricultural escalation and boost of food availability (Grafton et al., 2015). However, strategies for increasing agricultural productivity need to be focussed. Culture of fish, particularly composite fish culture can be an imperative tool for sustainably recuperating agricultural productivity and for strengthening rural economies (Nagabhatla et al. 2012; Dey and Prein 2006; Dey et al., 2005). Water resources are continuously deteriorating everyday at a quicker rate primarily due to hasty population and urbanization load. Declining water quality is currently a global issue (Mahananda et al., 2010). The water purity varies from place to place in nature (Patil 2013). Essentially, the interaction between physical, chemical and biological components of a habitat determines the quality of water of an ecosystem. Mostly, aquatic biota influences the physico-chemical characteristics of an aquatic ecosystem (Sharma et al., 2009). Limnology essentially deals with inland aquatic ecosystems. Primarily, the growth and survival of fresh water inhabitants depend on the quality of water (Boyd, 1989; Boyd, 1990; Philips, 1991; Jhingran, 1985). Fish plays an important role in agriculture sector of India. It provides livelihood to more than 60 million people and earns more than 6800 crore rupees through export. Extensive limnological studies have been

carried out (Olopade, 2013; Nikolosky, 1963). The quality of water predominantly depends on the physical, chemical and biological characteristics of water (Zweig et al. 1999; Adeniji and Ovie 1982; Das and Padhi, 2014; Padhi et al. 2015). Mostly, the present study is focused on the determination of quality of water in order to utilize the ponds for aquaculture.

MATERIALS AND METHODS

Site of study

For the purpose of study, three ponds (P1, P2 and P3) in three villages in the eastern coastal state of India were chosen for investigation, and such ponds were not utilized for fish cultivation earlier.

Measurement of environmental parameters

The physico-chemical parameter chosen was nitrate-nitrogen ion determination. Measurement was primarily made by following standard procedures (APHA-2005) using water testing kits (NICE), during the period from November 2018 to October 2019.

RESULTS AND DISCUSSION

The maintenance of good water quality is essential for both survival and optimum growth (Gupta and Gupta 2006). The water quality standards vary significantly due to different environmental conditions, ecosystem and intended human users EPA 2006. The quality of aquaculture products and their suitability for human consumption may also be affected by water quality (Zweig et al. 1999). Keeping these factors in view, the ponds under study were maintained for aquaculture imparting training to local people also in order to empower them for gainful employment (Table 1 and Fig.1).

CONCLUSION

During the period of study, care of the ponds was monitored by a group of peer volunteers from each village who have assisted in managerial activity and watch of the ponds in their respective villages. The profit of the sale proceeds of fish was being used as seed money by the volunteers for cultivation of fish for livelihood besides other engagements. Thus the objectives have been achieved through training and interaction sessions generating confidence among the villagers for aquaculture for their livelihood.

ABSTRACT

Here, we aimed to determine the PH of the community based ponds in order to validate the suitability of the pond for aquaculture practices. PH was measured across three different ponds and finally fish farming was initiated. The pH was found to be between 5.4 and 8.3. This study primarily focuses on making use of unexploited ponds present in the community aiming for introducing fish farming, resulting in an increment in the local economy.

Key words: Community, aquaculture, fish, pH, ponds.

INTRODUCTION

With an ever increasing food demand, contribution of fish farming is significant. Water is considered to be a vital natural resource and a critical agricultural input (Huang et al., 2015). Water usage is essential for sustainable agricultural escalation and boost of food availability (Grafton et al., 2015). However, strategies for increasing agricultural productivity need to be focussed. Culture of fish, particularly composite fish culture can be an imperative tool for sustainably recuperating agricultural productivity and for strengthening rural economies (Nagabhatla et al. 2012; Dey and Prein 2006; Dey et al., 2005). Water resources are continuously deteriorating everyday at a quicker rate primarily due to hasty population and urbanization load. Declining water quality is currently a global issue (Mahananda et al., 2010). The water purity varies from place to place in nature (Patil 2013). Essentially, the interaction between physical, chemical and biological components of a habitat determines the quality of water of an ecosystem. Mostly, aquatic biota influences the physico-chemical characteristics of an aquatic ecosystem (Sharma et al., 2009). Limnology essentially deals with inland aquatic ecosystems. Primarily, the growth and survival of fresh water inhabitants depend on the quality of water (Boyd, 1989; Boyd, 1990; Philips, 1991; Jhingran, 1985). Fish plays an important role in agriculture sector of India. It provides livelihood to more than 60 million people and earns more than 6800 crore rupees through export. Extensive limnological studies have been

carried out (Olopade, 2013; Nikolosky, 1963). The quality of water predominantly depends on the physical, chemical and biological characteristics of water (Zweig et al. 1999; Adeniji and Ovie 1982; Das and Padhi, 2014; Padhi et al. 2015). Mostly, the present study is focused on the determination of quality of water in order to utilize the ponds for aquaculture.

MATERIALS AND METHODS

Site of study

For the purpose of study, three ponds (P1, P2 and P3) in three villages in the eastern coastal state of India were chosen for investigation, and such ponds were not utilized for fish cultivation earlier.

Measurement of environmental parameters

The physico-chemical parameter chosen was PH determination. Measurement was primarily made by following standard procedures (APHA-2005) using water testing kits (NICE), during the period from November 2018 to October 2019.

RESULTS AND DISCUSSION

The maintenance of good water quality is essential for both survival and optimum growth (Gupta and Gupta 2006). The water quality standards vary significantly due to different environmental conditions, ecosystem and intended human users EPA 2006. The quality of aquaculture products and their suitability for human consumption may also be affected by water quality (Zweig et al. 1999). Keeping these factors in view, the ponds under study were maintained for aquaculture imparting training to local people also in order to empower them for gainful employment (Table 1 and Fig.1).

CONCLUSION

During the period of study, care of the ponds was monitored by a group of peer volunteers from each village who have assisted in managerial activity and watch of the ponds in their respective villages. The profit of the sale proceeds of fish was being used as seed money by the volunteers for cultivation of fish for livelihood besides other engagements. Thus the objectives have been achieved through training and interaction sessions generating confidence among the villagers for aquaculture for their livelihood.

ABSTRACT

In present day scenario, generation of energy from non-renewable energy has become difficult due to the limited resource of non-renewable energy sources. Therefore researchers are doing research to generate energy from renewable sources in order to meet the energy demand using Solar Photovoltaic module [12]. Different most popular PV solar technologies like Mono crystalline silicon, poly crystalline silicon, amorphous silicon and thin film. The achievement of different type of PV solar technologies depends on the environmental parameters acting upon them. A proper comparison is developed among the mono-crystalline, polycrystalline has been done. PVSolonline software is used to study the characteristics between different types of PV solar technologies.

Keywords : Solar cell; solar irradiation; PV array; temperature; amorphous; crystalline

INTRODUCTION

In present scenario, the generation of electricity from non-renewable sources has become a challenging task. Therefore, in order to overcome the decreasing non-renewable sources, generation of electricity from renewable sources have taken place [1]. The generation of electricity from solar energy is done with the help of PV cells. PV is gives positive attention due to non intervention of thermal process ([4]-[6]). Utilization of solar energy in correct way can help us to meet the increasingdemand of energy ([1],[7-9]).The relationship between voltage and current in case of Photovoltaic solar cell is non-linear and this non-linearity varies with the temperature and solar radiation [1].Different most popular PV solar technologies like Mono crystalline silicon, poly crystalline silicon, amorphous silicon and thin film. [8].For high efficiency, longevity and space efficient monocrystalline PV cells give better result.The disadvantage of monocrystalline PV cell is its high cost [9]. To overcome this disadvantage now a

daysPoly-crystalline solar panels are used. Though the efficiency of this panel is less but still it is popular because of its low cost. The performances of these modules depend on various types of electrical andenvironmental parameters.The entire paper is organised as follows. Section II gives a generalized idea of solar cell. Section III working principle of solar cell and section IV describes the different types of PV cells. Section V gives comparative study of different types of PV cells. section VI. Finally conclusion is drawn at the end.

Solar cell

Solar cells are basically made up of PV system which consists of semi-conducting material responsible for converting the energy of photon into electricity. Whensufficient amount of light strike the panel, photonswith a specific wavelength trigger electrons to flow throughthe materials to produce direct current (DC) electricity([5],[10-14]). To get higher outputvoltage, solar cells are generally connected in series.While for high output current it is connected in parallel structure ([1-4],[11-17]). Incase of PV panel the photovoltaic cells are usually connected in series.

Working of solar cells [11]

A solar cell can be defined as a semiconductor device which helps in conversion of sunlight into electricity with the help of photovoltaic effect [13]. Aphotovoltaic cell is made up of P-type and N-typesemiconductor materials which have different electrical propertiesjoined together [11]. The junction between these twosemiconductors is called P-N junction [11]. The sunlight containsphotonswhen falls solar panel gets absorbed by the semiconducting materials. This result in the creation of electron-hole pairs.Thus, when a solar cell is connected to a load the clectron-hole pair present near the junction separate from each other resulting in collection of holes near the positive terminal and electrons at negative terminal.This helps in creation of electric potential across the terminals. The differencebetween the electric potentials at the terminals result involtage across the terminals [11]. This voltage is used to drive the current in thecircuit. This current in the circuit will be a DC quantity [11]. Atypical diagram of production of electricity from PV panel [11]

Types of PV Cells

A large number of solar cells are present which are made up of different materials. The most common type of solar cells used include Monocrystalline solar cell, Polycrystalline solar cell, Thin film solar cell, Amorphous solar cell, etc. [12] Mono crystalline cells are made up of silicon single crystal which is physically appeared in uniform black shade which indicates high purity of the panel whereas the poly crystalline is made up of multi silicon crystal appeared as different blue shade. Mono cells are octagonal and poly crystalline cells have square shaped cells. These type solarpanels are made by melting raw silicon which is faster andcheaper process than that used for monocrystalline process. Third type of classification is thin film solar cell which ismanufactured by placing one or more films of photovoltaicmaterial (such as Si, Cd, or Cu) on to a substrate sincethese types are easiest to produce and hence these arecheaper. Fourth type of classification is amorphous silicon solar cells (A-Si) which are most widely used in pocket calculators. [11]

CONCLUSION

The comparative study of polycrystalline andmonocrystalline PV module is carried out using PV-sol software. The study shows that, the efficiency of monocrystalline solar panels are typically 15-20% and highest in the market today. Monocrystalline solar panels produce up to four times the amount of electricity as poly crystalline solar panels..

ABSTRACT

The framework we have seen is regularly of a simply persistent or discrete nature. The impact of unsettling influence unexpected to the framework altogether perceive by its "discrete conduct" of the framework. In this paper, we'll center around how to communicate what we call "discrete conduct". There is a wide range of building use cases for depicting such conduct and we'll investigate these through the different models introduced in this paper. Ordinarily, when we talk about discrete conduct we regularly allude to "occasions". An occasion is something that happens in our framework that triggers an irregularity. Differential conditions ordinarily bring about consistent arrangements. In any case, when occasions happen, they can present different sorts of discontinuities.

Keywords: Continuous behaviour, Discrete behaviour, Modelica, Object-oriented language, Newton cooling dynamic.

INTRODUCTION

Typically, when we talk about discrete conduct we regularly allude to "occasions". An occasion is something that happens in our framework that triggers intermittence. Differential conditions typically bring about consistent arrangements. In any case, when occasions happen, they can present different sorts of discontinuities. The most straightforward kinds of occasions are ones that occur at a specific time. These are, as anyone might expect, called "time occasions". Since these occasions are attached to the time, we realize what time they will happen even before they occur. Instances of time occasions would be things like changes activated by an advanced clock that is actuated at some predefined recurrence [1]. The other sorts of occasion we will experience are alleged "state occasions". These sorts of occasions are a lot trickier to deal with. The explanation is that we don't have the foggiest idea about from the earlier when these occasions will happen. Not at all like time occasions, have we needed to really hang tight for some

sign in our framework to cross some predefined limit. As a rule, we don't have a clue when that intersection will happen. Besides, deciding the exact second when the occasion happens is to some degree costly [2].In this paper, we'll take a gander at instances of both of these sorts of occasions and the different Modelica language includes that can be utilized to depict when these occasions happen and how we portray reactions to them:

- The conduct to be watched must be a discrete conduct one that has an undeniable start and end.
- It is suggested when conduct happens an extraordinary number of times or if conduct can happen for expanded timeframes.
- Consists of denoting the occasion's objective conduct happens during a predefined timeframe.

Modelica is a general condition based item arranged language for nonstop and discrete-occasion demonstrating of physical frameworks with the end goal of effective reproduction. The language brings together and sums up past article arranged demonstrating dialects [3]. It is achieving an upset around there, in light of its usability, the visual structure of models with a blend of Lego-like predefined model structure hinders, its capacity to characterize model libraries with re-usable segments, and its help for displaying and recreation of complex applications including parts from a few application spaces. In this paper, we present the Modelica language with an accentuation on its language highlights and one of the related re-enactment situations. Recreation models can be created in a coordinated critical thinking condition by utilizing a graphical editorial manager for association outlines. Associations are set up just by drawing lines between objects picked from a class library. The standards of article arranged physical frameworks demonstrating and the multi-area abilities of the language are introduced in the paper by a few models.

COOLING REVISITED

Changing Ambient Conditions

We will begin with a basic model that exhibits time occasions. We will return to the warm model presented beforehand in the segment on Physical Sorts. Nonetheless, this time we will acquaint an unsettling influence with that framework. In particular, we will trigger a sudden decline in the surrounding temperature after a large portion of a moment of reproduction. This updated model is composed as follows: Newton's law of cooling is utilized to display the temperature of an object of some temperature put in a domain of an alternate temperature. The temperature of the article *T(t)* hours subsequent to being put in the new condition is displayed by the equation [4].We will begin with a basic model that exhibits time occasions. We will return to the warm model presented beforehand in the segment on Physical Sorts. Nonetheless, this time we will acquaint an unsettling influence with that framework. In particular, we will trigger a sudden decline in the surrounding temperature after a large portion of a moment of reproduction. This updated model is composed as follows:

Newton's law of cooling is utilized to display the temperature of an object of some temperature put in a domain of an alternate temperature. The temperature of the article *T(t)* hours subsequent to being put in the new condition is displayed by the equation [4].

where:

$$T(t) = T_a + (T_0 - T_a) \cdot e^{-kt},$$

$Ta$is the ambient temperature (the temperature of the surroundings), assumed to be constant and not impacted by the cooling process,T(a) is the temperature of the object after a time of t hours has elapsed, T0 is the initial temperature of the object, and $k$is the decay constant.

```
model NewtonCoolingDynamic
  "Cooling example with fluctuating ambient conditions"
  // Types
  type Temperature=Real(unit="K", min=0);
  type ConvectionCoefficient=Real(unit="W/(m2.K)", min=0);

  type Mass=Real(unit="kg", min=0);
  type SpecificHeat=Real(unit="J/(K.kg)", min=0);

  // Parameters
  parameter Temperature T0=363.15 "Initial temperature";
  parameter ConvectionCoefficient h=0.7 "Convective cooling coefficient";
  parameter Area A=1.0 "Surface area";
  parameter Mass m=0.1 "Mass of thermal capacitance";
  parameter SpecificHeat c_p=1.2 "Specific heat";

  // Variables
  Temperature T_inf "Ambient temperature";
  Temperature T "Temperature";
initial equation
  T = T0 "Specify initial value for T";
equation
  if time<=0.5 then
    T_inf = 298.15 "Constant temperature when time<=0.5";
  else
    T_inf = 298.15-20*(time-0.5) "Otherwise, decreasing";
  end if;
  m*c_p*der(T) = h*A*(T_inf-T) "Newton's law of cooling";
end NewtonCoolingDynamic;
```

The feature lines show an if proclamation. This specific if explanation gives two distinct conditions to registering T_inf. You will note in this model the variable time isn't proclaimed inside our model. This is on the grounds that time is a worked in factor in all modelica models [5].The choice about which of the two conditions will really be utilized relies upon the contingent expressiontime<=0.5. It is on the grounds that this articulation just relies upon the time and no different factors in our model that we can describe the progress between these two conditions as a "period occasion". The key point is that when incorporating these conditions, we can tell the solver that coordinates our arrangement of conditions to stop accurately at 0.5 seconds and afterward continue again utilizing an alternate condition.

We'll see instances of other state occasions where this would not be conceivable, in the following segment when we present the exemplary Skipping Ball model. Yet, for the time being, let us proceeded with our cooling model. On the off chance that we recreate this model for one second, we get the accompanying temperature direction:

As should be obvious in these outcomes, the encompassing temperature does undoubtedly begin to diminish after a large portion of a second. In examining the dynamic reaction of the temperature itself, we see two particular stages. The main stage is the underlying transient reaction toward balance (to coordinate the surrounding temperature). The subsequent stage is the following of the surrounding temperature as it diminishes [6].

Initial Transients

It is important this is a typical issue in displaying. Much of the time, you wish to show the frameworks reaction to some unsettling influence (like the encompassing temperature decline for this situation). Be that as it may, in the event that you don't begin your framework in a balanced expression, the framework reaction will likewise

incorporate an underlying transient (like the one appeared here). So as to separate these two reactions obviously, we need to evade any cover between them. The most straightforward approach to do that is to begin the recreation in a harmonious condition (as examined past in our conversation of Consistent State Introduction). This keeps away from the underlying transient inside and out and permits us to concentrate altogether on the unsettling influence that we are keen on [7].

As we got the hang of during our conversation of Instatement, we can take care of this issue of beginning drifters by essentially including an underlying condition that will decide an incentive for T with the end goal that our framework begins in a balance state, i.e., The main thing we've changed is the underlying condition. Rather than beginning our framework at some fixed temperature, we start it at a temperature with the end goal that the adjustment in temperature (at any rate at first, preceding our unsettling influence) is zero. Presently the temperature reaction no longer incorporates any underlying transient and we can concentrate just on the reaction to the unsettling influence:

Events

We've seen a few different ways to communicate the way that there is a sudden change in the conduct of our framework. However, it's essential to bring up that we are not simply portraying an adjustment in the surrounding temperature, we are additionally indicating when it changes. This unobtrusive, however significant, point [10][11].

Think about the last model, where our framework started in a harmonious state. Toward the beginning of the recreation, there are no noteworthy elements. Since nothing is truly changing in the framework, the integrator is probably not going to amass critical combination blunder. Along these lines, so as to limit the measure of time required to finish the reenactment, variable time step integrators will, in such conditions, increment their progression size.

```
model NewtonCoolingSteadyThenDynamic
  "Dynamic cooling example with steady state conditions"
  type Temperature=Real(unit="K", min=0);
  type ConvectionCoefficient=Real(unit="W/(m2.K)", min=0);
  type Area=Real(unit="m2", min=0);
  type Mass=Real(unit="kg", min=0);
  type SpecificHeat=Real(unit="J/(K.kg)", min=0);

  parameter ConvectionCoefficient h=0.7 "Convective cooling coefficient";
  parameter Area A=1.0 "Surface area";
  parameter Mass m=0.1 "Mass of thermal capacitance";
  parameter SpecificHeat c_p=1.2 "Specific heat";

  Temperature T_inf "Ambient temperature";
  Temperature T "Temperature";
initial equation
  der(T) = 0 "Steady state initial conditions";
equation
  if time<=0.5 then
    T_inf = 298.15 "Constant temperature when time<=0.5";
  else
    T_inf = 298.15-20*(time-0.5) "Otherwise, decreasing";
  end if;
  m*c_p*der(T) = h*A*(T_inf-T) "Newton's law of cooling";
end NewtonCoolingSteadyThenDynamic;
```

Compactness

One issue with if articulations is that they can roll out moderately basic improvements in conduct show up very confounded. There are two or three elective builds we can use to get a similar conduct with less lines of code [8].

The primary methodology is to utilize an if articulation. Though an if explanation incorporates "branches" containing conditions, an if articulation has branches that contain just articulations. Besides, the sentence structure for an if

articulation is additionally less verbose. In the event that we had decided to utilize an if articulation our condition could have been streamlined to [9]:

```
equation
  T_inf = 298.15 - (if time<0.5 then 0 else 20*(time-0.5));
  m*c_p*der(T) = h*A*(T_inf-T) "Newton's law of cooling";
```

Alternatively, we could use one of the many built-in Modelica functions, like max, to represent the change in the ambient temperature, *e.g.*,

```
equation
  T_inf = 298.15 - max(0, 20*(time-0.5));
  m*c_p*der(T) = h*A*(T_inf-T) "Newton's law of cooling";
```

CONCLUSIONS

This is one of the numerous instances of highlights in Modelica that streamline the manner in which reproduction is done in this paper. An increasing nitty-gritty conversation of this sort of taking care of is appropriately portrayed in this paper. Modelica compilers give the structure of the issue. In this issue, the compiler can see that there is an unmistakable change in conduct. Not just that, it can see that this adjustment in conduct is a period occasion, i.e., an occasion whose time is known from the earlier with no information on the arrangement direction. Along these lines, what a Modelica compiler will do is illuminate the fundamental integrator that there will be an unexpected change in conduct at 0.5 seconds and it will educate the integrator to just incorporate precisely up to that point and no further. Thus, the unexpected change never happens inside a period step. Rather, the integrator will basically restart on the opposite side of the occasion. This totally keeps away from the visually impaired looking for the cutoff time that limits the mistake in the progression. Rather, the integrator will coordinate right up to that point naturally and afterward restart after that point.

ABSTRACT

Modelica offers the chance of actualizing models of intensity frameworks n an efficient structure. Since Modelica models can be implemented by associating different models, a few pieces of the force framework, (for example, generator power plant models and other control components, and LTC transformers) can be integrated into one smaller model and utilized in grid displaying. Modelica offers the chance of implementing models of power grids in a precise structure.. As the demonstrating technique in reference programming is unique in relation to Modelica, it is important to follow another arrangement of systems.

Keywords: Dymola,Modelica,PowersystemLibrary,PSS,Excite.

INTRODUCTION

It is hypothetically practical to implement and reproduces integral power framework models in Modelica with the vital part models arranged. This paper presents in Modelica [7][9] the encounters of intensity framework displaying [1] and dynamic reproduction. Four structures of fluctuating size are introduced in this investigation. It is hypothetically doable to implement and recreates integral power framework models in Modelica with the important part models arranged. As a rule, various force framework reproduction tests ought to be directed to assess the legitimacy of the picked approach, and the recreation results ought to be approved a couple of endeavors have been made n ongoing years for power framework demonstrating and reenactment utilizing Modelica [5][6].

A few libraries, in any case, are not finished or shut for changes, implying that one can not alter or improve the models. Thus, It is important to build up another force framework library in which so as to direct explicit analyses in the test framework, extra models for the relating gadgets ought to be incorporated into the force framework library. For instance, for voltage soundness tests, the heap tap changer model (LTC) is required. Simultaneously, the models must be numerically precise and have a sensible match with genuine conduct, to accomplish the best reproduction

results. Programming to-programming approval will be done between models dependent on Modelica and the reference programming in which the segments of the force framework were created. To guarantee that the segment models can work well in huge scope framework reenactments, some delegate test frameworks ought to be implemented, and recreation to these test frameworks will be led. The models of the test grid are likewise approved with references. Also, expectation for implement Modelica is to fill in as an answer for the issue of model sharing and co-reproduction between various programming conditions, adjustment and support are conceivable. Such a force framework library is as of now being created at SmarTS Lab inside the setting of the Tesla FP7 venture [8]. Instances of model trade applications are expected to demonstrate the arrangement's achievability.

A)Contribution soft hepaper

1. Give approved models to add to the improvement of the Modelica power framework library.
2. Give approved test framework models to be utilized principally n model approval undertakings, and other powerful security appraisal assignments n the Tesla FP7 venture.

INTRODUCE THE MODEL SYSTEM AN HIERARCHICAL STRATEGY

Modelica provides the ability to apply intensity models in a particular graded way. As models can be implemented in Modelica by interfacing various system models, a few parts of the force system (e.g. generator for power plant im plementations and other control components, and LTC transformers) can be combined into one smaller model and used in frame display.Figure 1 shows a case of a hydroelectric power plant model from Modelica. speed control, Generator, and hydro turbine models are integrated into the hydropower plant model that can be used to demonstrate straightforward in power grid. Since the demonstrating approach n reference programming s not quite the same as Modelica, its important to follow another arrangement of strategies. The means of fruitful displaying are as per the following:

1. Peruse System Specification:If definite segment models are not provided, desired the parts to be accompied as per given application and use in the grid model.
2. Decide the parameters for the models in question. If parameters and information are not determined in the detail, different strategies for identification of parameters (for example identification of estimation based parameters) can be utilized.
3. Model implementation in Modelica.
4. Gather information about the force stream arrangement and initialize the gadget model.
5. Reenactment execution, correlation of recreation results with reference framework. Model.

Nordic 32 KTH Grid

System overview

A form of the purported Nordic 32 test method [10][11] s the principal test framework implemented n this examination, KTH Nordic 32, The framework s anecdotal yet identical to the Swedish and Nordic gridnetwork. KTH Nordic 32 framework single-line graph s indicated n Figure 2. The framework includes 20 generators, 32 transmission and 22 dissemination means of transport, for 74 means of transport n absolute. The test framework s separated into four areas[12][13]:

- North "with some heap and hydro age.
- Central "Equiv" with overwhelming burden and warmth age associated with the North "incorporates a basic outer framework proportionate..
- South "with warm creation, genuinely free to the remainder of the system.

Out of the given test grids 20 generators, 12 are hydro generators found n the North and Equivalent regions, while the rest are warm generators found in the Central and South zone. The framework s intensely accused of huge

exchanges predominantly from north to focal zones, effectively prompting framework instability. The ostensible recurrence would be 50 Hz. Recurrence is constrained by the speed governors at the North and Equiv hydroelectric force plants. G20 s a comparable generator, with a noteworthy involvement n essential recurrence control. This guideline doesn't include the warm units in the Central and South districts. The most extreme force which can be conveyed to the focal burdens is firmly influenced by the Central and a portion of the Northern generators' responsive force capacities. Over-excitation limiters (OELs) impose their receptive force limits. If the force required to be conveyed after an aggravation, (for example, a line blackout) s bigger than the constraints of the generator, voltage instability will result. Initially implemented in PSAT, the KTH Nordic 32 framework is considered the reference for the framework model in Modelica.

Model and data

Transports: The grid has 52 hub means of transport including 20 generator modes of busses. The voltage levels are four: 15 kV for generator busses 20 kV for conveyance busses, 130 kV, 220 kV and 400 kV for transmission busses.

Transmission lines: The grid brags an all-out 52 transmission lines. The model of the transmission line s dependent on the circuit proportionate to π. The qualities are n per unit for opposition r, response x, and susceptance b. Shunt conductance s not considered n this model.

Loads: The grid loads are displayed as steady impedance loads. While initializing the model, with hub voltage greatness U_0, load dynamic force P_0, and responsive force Q_0 are changed from power stream arrangement into steady impedances R_l and X_l:

……..…….(1)

$$P_0 = \frac{R_l U_0^2}{R_l^2 + X_l^2}, \; Q_0 = \frac{X_l U_0^2}{R_l^2 + X_l^2}$$

Shunts:The network has 11 shunts, nine of which are condenser banks and the remainder are inductor banks. The capacitive shunts are positive susceptibility while the inductive shunts are negative eb.

Synchronous generators: The system uses two synchronous generatormodels: three rotor windings for hydro electric plant salient-pole machines (Order V Type 2) and four windings for thermal power plant rotor machines (Order VI). All the data reflects the data proposed by Van Cutsem [14], except for the appar entnominal power of G18, which is modified to1600 MVA. It neglects the effects of saturation.

Turbine governors: The system employs two types of Turbine Governors. For thermal generators TG Type is used while TG Type is used for hydro generators. The data for hydro T Gssgivenin [14], where as for the thermal TGs recommended values are used. The TG Type model is shown Figure 3, and the values for the thermal TGs are used. Form model TGis shown in Figure 3.

Automatic voltage regulators (AVR):For all generators these are used to control the field voltage v_f. Figure 4 shows the AVR model used in type AVR [2] systems. The suggested values are the parameters set out in [15].

Overexcitation limiters: Each generator is fitted with an Over-Excitation Limiter (OEL) to keep with in limitsts field current. Because the focus is on over excited generators, there is no lower limitation to the excitation.The OEL, asseen in Figure 5, is modeled as a purente grator with hard limits to anti-wind up. The OEL will not be triggered unless the current field is greater than t_s flim. The field current is calculated using terminal voltagege nerator v_g, active power p_g, and reactive power q_g. Figure 6 llustrates the system model in Modelica

Simulation and validation

To examine the system's dynamic response, as hort-circuit fault of three phases applied on"Bus 2032"att=15-15:1s,with the fault mpedance Z_{fault} = 0:0001 + j0:001. The fault is set on this bus to decrease then fluence on critical

generators and to avoid affecting the dominant power flow. The validation of the system model is done by comparing Dymola and PSAT response soft wo systems. The machine response is examined after fault by analyzing the following outputs, as shown Figure.7.

- Distribution bus voltage: VB4022, VB2032,VB4012(NORTH)VB1041,VB1043,VB1045VB4041(CENTRAL)
- Generat or terminal voltage:*VG*8,*VG*12(NORTH)*VG*6,*VG*13(CENTRAL)

Generator rotor speed: *w8*(NORTH)*w6*(CENTRAL)

DISCUSSION

As the dissemination transport voltages show n Figure 7, the framework displays damped electro mechanical motions that cease to exist n 10 seconds n reaction to the short out issue applied to one of the generator transport at t = 15s. Since the deficiency s applied to "BUS2032," a non-basic generator transport that s a long way from the North-Central passage, the flaw doesn't influence the predominant force stream. In this manner, the flaw s not making the framework breakdown n voltage. The voltage swaying can be watched n the two territories, for the framework s firmly associated by the 400 kV transmission lines among North and Central regions. Nonetheless, as the flaw s applied to a transport n the north and doesn't result n a significant force misfortune n the focal district, the motions n northern transports are increasingly outrageous. Since AVRs are installed on every generator, the voltage of the terminal s controlled to keep up a steady. The AVRs can be seen running great. Correspondingly, in light of the fact that North Area generators are more influenced than Central Area generators, the voltage motions n G8 and G12 are more serious than G6 and G13.

The G8 (found n North) and G13 (found n Central) generator rotor speeds are kept at around 1 p.u. By ts Governor On generator installed. Also, t can be found from the correlation of the yields from two frameworks That two frameworks react n a pixie comparable design to the unsettling influence. There are minor varieties between the procedures of wavering, the clarification lies n the errors between the two programming numerical solvers

ABSTRACT

In order to enhance the quality of voltage or current waveform and to decrease the harmonics content, the level of voltage source inverter is increased to make stair case like waveform and the increased level voltage source inverter is known as multilevel inverter (MLI). A Hybrid Cascaded Modular (HCM) multilevel inverter topology reduces the number of power switches, losses, installation area, voltage stress and converter cost in comparison with the conventional MLIs such as Diode clamped MLI, Flying Capacitor MLI and Cascaded H-bridge MLI. Hybrid cascaded modular MLI uses Nearest Level Control (NLC) modulation technique, which is a low switching frequency modulation technique to generate the gating pulses for the power semiconductor switches. So this HCM MLI with NLC technique becomes an efficient photovoltaic (PV) inverter. It takes the DC power from the PV array through DC-DC boost converter and gives to the induction motor based water pump. In order to maximize the power output and increase the efficiency of a PV module under varying operating conditions, MPPT control is used. MPPT block changes the duty ratio continuously under varying irradiance to keep the output voltage constant. The water pump takes the water form reservoir and stores it into the tank with a constant flow rate and under constant pressure during sunny day and the stored water can be used for domestic applications or any irrigation purposes when the solar irradiance is not available. This type of PV powered pumping system is often suitable for rural areas where the accessibility of grid is not available. It employs Simulink to model a hybrid cascaded modular MLI, DC-DC boost converter MATLAB embedded code to implement perturb and observe (P&O) MPPT algorithm.

Keywords : MPPT, HCM, NLC,TTL, NLC

INTRODUCTION

The sun is a non-polluting resource responsible for the sustained life on earth and can give us efficient renewable energy. The fact that solar energy is cleaner than any other energy produced from fossil fuels makes this resource of sustainable energy very important for the planet future. Generally around 92% of rural population [18] have no access to electricity due to the prohibitive cost of extending the existing electrical network therefore farmers face problems during their cultivation work such as water pumping etc. So the use of renewable energy like photovoltaic (PV) is one the solution for this problem. Therefore PV panel is interfaced with induction motor drive for pumping application via conventional MLI such as diode clamped MLI, flying capacitor MLI and cascade H-bridge MLI etc. But the efficiency of such PV inverter is low and the cost of the PV inverter is more because conventional MLI requires more number of switching devices. In this thesis hybrid cascaded modular (HCM) MLI is taken as PV inverter. To improve the efficiency of PV module we have to use maximum power point tracker (MPPT) [10]. The comparison between PV powered water pumping system Vs. diesel (or Gas) powered system [13] is given in the table. Configuration of a solar PV powered pumping system is shown in the figure 1. All these sections such as PV array, MPPT algorithm, DC-DC boost converter, hybrid cascaded modular (HCM) MLI and Water Pumping system are modelled using MATLAB Simulink.

Proposed System for PV Water Pumping

This thesis proposes a new PV inverter i.e. hybrid cascaded modular (HCM) multi-level inverter (MLI) which is used as an interfacing converter in PV power based pumping system. Figure 2.1 presents the proposed PV system. This includes a PV panel, a boost converter, a three phase HCM MLI nearest level control (NLC) controlled inverter, and a three phase induction motor. An MPPT block is also incorporated into the system so that the input voltage at the converter side can be kept constant.

This proposed system can be categorised into three sub system namely photovoltaic (PV) generator system, inverter unit and the load unit. In photovoltaic (PV) generator system consists of PV array, maximum power point tracker (MPPT) and DC-DC boost converter. In inverter unit, hybrid cascaded modular (HCM) multilevel inverter is used. The nearest level control (NLC) modulation technique is used for generation of gate pulses for the switches of the HCM MLI. The load unit is the induction motor based water pumping system.

The conventional PV water pumping systems consists of a battery backup alongside the components mentioned in the previous section. By incorporating a battery into the system will reduce the lifetime and will also increase the initial cost as well as the yearly maintenance cost of the entire system. With an aim of reducing the overall cost of the system and to increase the lifetime, a new design has been proposed here. The design of this system is done from the load side, taking into account the quantity of water to be pumped and the head at which it has to be stored. So the proposed PV power based water pumping system is the system without batteries unit.

Multilevel Inverter

The term multilevel began with the three level converters. Subsequently, several multilevel converter topologies have been developed. A multilevel converter has several advantages over a conventional two-level converter that uses high switching frequency pulse width modulation (PWM).

There are basically three types of multilevel inverters such as

Diode clamped multilevel inverter (Neutral Point Clamped inverter)

- Diode clamped multilevel inverter (Neutral Point Clamped inverter)
- Flying Capacitor Multilevel Inverter (Capacitor Clamped Inverter)
- Cascaded H-bridge Multilevel Inverter

Apart from these three conventional MLI there is a popular and efficient MLI called hybrid cascaded modular (HCM) MLI. The advantages of the HCM MLI are given below 1. For a given voltage level it requires less number of switches than the conventional one, which in turn results in reduction of installation area and converter cost

Less switching losses because it uses nearest level control (NLC) technique in its modulation technique to provide the gate pulse to switches.

For example in case of a 9-level multilevel inverter, each conventional MLI such as diode clamped MLI, flying capacitor MLI and cascade H-bridge MLI requires 2*(9-1)=16 switches.

Whereas hybrid cascaded modular (HCM) MLI requires only 8 switches for 9-level. Therefore it can be an efficient photovoltaic (PV) inverter for various applications. And to increase overall efficiency of the system hybrid cascaded modular MLI will be incorporated with the photovoltaic (PV) panel to drive induction motor

Modulation Technique

Here we have used tThe nearest level control (NLC) modulation technique to control the output voltage of the hybrid cascaded modular (HCM) multilevel inverter (MLI).Mainly modulation technique can be classified into two types depending upon the switching frequency such as high frequency modulation and low frequency modulation

The Nearest level control (NLC) is low switching frequency control technique. This method is also called as round method. Usually this NLC method is used to provide gate pulse to switches of HCM MLI. This methods leads to reduction in switching losses. The output voltage can be found out by considering a reference sine wave in accordance with nearest voltage level (v). Given a voltage reference vref , the nearest output Voltage level (v) can be determined with

$$v = V * round\{Vref/V_C\}$$

Where, v is the nearest voltage level V is the supply dc voltage The function returns the nearest integer of the input number (e.g., round (3.4) = 3, round (3.6) = 4) .This nearest integer multiplied by 'V' corresponds to the closed level to the reference that is generated by the inverter. Based upon the integer value one switching state is chosen at a time to provide corresponding desired voltage level at output. The reference waveform with the existing output voltage with level count 'L' as depicted in Figure 4.2. Its Implementation is illustrated in Figure 4.3.

$$Vref = m * \{(L-1)/2\} * V * sin(wt) = Vmsin(wt)$$

Where, m is modulation index

Vref is the reference voltage

Vc is the voltage across capacitor

Vm is the peak value of reference voltage

Simulation & Result

The simulation of 1 phase 9-level HCM MLI was done using MATLAB and SIMULINK. The output voltage waveform output voltage waveforms with reference waveform are shown in the figure **5** and figure 6 respectively.

CONCLUSION

In this thesis an efficient and simple PV powered water pumping system was proposed. Hybrid cascaded modular MLI was used as a PV inverter which has less number of switches than the conventional MLIs for a given voltage

level. The PV array, MPPT algorithm block, DC-DC boost converter, 9 level HCM MLI and a single phase induction motor based centrifugal water pump were simulated using MATLAB Simulink environment

ABSTRACT

Computer vision involves different image processing technique to process the image captured through any acquisition devices. The processing of image performed to extract feature from the image to acquire more information about the image as well as for other image processing application. For those operation MATLAB provide script functionality to perform the operation. But to avoid coding the computer vision tool box can be utilized to perform those operations. In this paper image de-noising and edge detection has been performed with the help of computer vision block set instead of long coding as script file. Both the operation are working fine and have been implemented for live execution with the help of system inbuilt camera.

Keyword: Computer vision, live video processing, image de-noising, simulink

INTRODUCTION

Computer vision is a field of computer technology which deals with understands the visual world through digital images captured using digital camera. It involve different image processing technique like enhancement, reconstruction, compression, segmentation, recognition etc for different types of application [1].

MATLAB is a numerical computing environment for development of algorithm and simulations [2]. MATLAB provide an environment which completely based on matrix manipulations. It also provides option for data visualization and other complex tool boxes for high level computation. The MATLAB allowed user to developed different image processing application using the script file. This involves the use of static images to operate and perform execution.

Simulink is a MATLAB-based graphical programming environment for system modeling and analyzing of the modeled system [3]. It provides an interface for pick and place based graphical programming with the help of block libraries. Simulink has different block set library. The computer vision system toolbox (shown in figure 1) is one of the libraries of tool boxes which used for computer vision operation [4]. This tool box can be used for both static images by capturing one frame as well as can be used with live video streaming. The video streaming is nothing but the sequence of mage frame, all the image processing operation are applied to each and every frame one by another with the help of these blocks. So that these block se allowed the user to use these block set or live image processing.

Experimental Simulation

For experimental simulation MATLAB R2014b has been used with a required specification computer system. The simulink model has been design by picking different required block for the de-noising and edge detection operation. The entire block set connected properly (shown in figure2) before execution. The 'From Video Device' block basically used to acquire image and video frames from image acquisition devices like digital camera. This block is responsible for acquiring the image or video data to simulink environment. This block is available inside the Image acquisition toolbox. It set to use the default camera of the computer system. The live streaming was captured with the help of this block. It captures the real time video with different resolution. In the current experiment it was set to 640x480 resolutions. The Color Space Conversion block converts one color space to other color space as per the specified conversion parameter [5]. Here RGB to gray scale has been chosen. The gray scale image can be obtained from the R'G'B' to Intensity block. Then both the RGB and gray scale image has been shown using the video viewer (Figure 3-4). The Image Data Type Conversion block used to change the data type of the input image to other format as specified by user. The gray scale image is converted to single data type using that block.

MATLAB Function block is used to write a MATLAB function for use in a Simulink model. The MATLAB functions which are created can be executed for simulation and generates code for a Simulink Coder. The MATLAB Function block used to insert the pepper noise to the gray scale image. In a separate m file the corresponding program has been written for the MATLAB function block. When the block gets executed by default the corresponding code will also execute. The noisy image has been shown using a video viewer (figure 5).

The median filter generally based on masking operation. It selects an m x n sub image or neighborhood and performs the median operation of the elements inside the neighborhood. The resultant median value replaces the center element of the neighborhood. This process continues till it select every sub image of that size inside the image [6]. Finally the result displayed represents the median filtered image. The median filtering is best suitable for salt and pepper type noise. This median filter block has been used to remove the pepper noise from the noisy image. The denoised live video image can be seen through the video viewer (figure6).Edge detection is the process of detecting the edge points in an image [7, 8]. This operation basically performed with the help of gradient operators and it determines the gradient magnitude value of image. The mostly used kernel is the Sobel kernel for edge detection. The Edge Detection block used for edge detection operation on gray scale frame. For another approach to display live edge detection, the edge detection block available inside Feature Detection, Extraction and Matching section of the computer vision tool box has been used for real time edge detection of the video frame. The live edge detection can be shown using the video viewer (Figure 7).

CONCLUSION

MATALB and simulink support the computer vision operation which able to perform different image processing application. In this paper the live de-noising video frame has been shown with the help of laptop camera as well as live edge detection has been shown. The de-noising of noisy image working fine with the help of median filtering block set. The SNR improved a lot after the de-noising operation. The edge detection operation also working very efficiently with the help of edge detection block set. Both the method demonstrated using the computer vision simulink block set, and it working very accurate. The most important feature is the real time live performance of the system. In the future more complex system like feature extraction of any capture video can be designed.

ABSTRACT

Dymola's multidomain capabilities allow users to catch all applicable physics in the context of electrical engineering. Modelica's versatility enables fast nvention, design and testing of systems from rotor mechanics to power grid. It is also possible to model the entire power plant from the source of electricity, whether it is oil, coal, hydropower or other renewable sources, such as wind, All the way to the end user, via the generator and power grid. The components in the Electric Power Library provide the thermal and mechanical domains with uniform nterfaces and can be easily combined with components from other libraries to reflect electric power and actuation. Applications nclude: power grid n nominal and fault conditions, power generation scenarios including grid-connected wind turbines, multi-connected turbine generators and multi-phase generators, as well as a variety of system use examples for different use scenarios. Also deal for control design, the Electric Power Library supports multiple reference frame representations ncluding the standard nertial "abc" reference frame, as well as the Park transformed "dq0" and "dq" representations. The transformations allow efficient modeling of multiphase AC systems for both transient and stable dynamics of the state.

Keywords : Dymola, Modelica, Power system Library, PSS, Exciter,

INTRODUCTION

Modelica is an article arranged, definitive, multi-area language for demonstrating complex frameworks, for example, physical frameworks containing mechanical, electrical, water-powered, warm, electrical, or process-situated sub-segments [1]. Modelica language s intended to help viable library improvement and trade of models. This s a cutting edge language dependent on causal displaying of scientific conditions and article situated structures for the reuse of information demonstrating [1]. The Modelica language is being created by the Modelica Affiliation which s not an organization. The Modelica Affiliation has likewise built up a free Modelica Standard Library which includes around

1360 nonexclusive model parts and 1280 capacities n distinctive areas now updating the library to rendition 3.2.1. As depicted n Table 2.1 various business and free programming assets dependent on Modelica are presently accessible for industrial and scholastic use. The important differences between various applications s the interface and the solvers. While a few open-source frameworks (for example Scicos) utilize a Modelica sub-set to show segments.

In this paper, Dymola was chosen as the setting for demonstrating and reenactment. Contrasted with other Modelica conditions, Dymola s easier to use and has solver proficiency that permits enormous frameworks to be reenacted quicker. it causes clients to make a graphical portrayal of physical structures that are helpful n power framework systems implementation. Likewise, models in Dymola can be traded to the FMU design which another programming (for example Simulink) can see, which means co-recreation and trade of information with other reproduction instruments can be figured it out.Table 2.1.

Application example

This section presents an example of the main constructs used by Modelica to specify the DAEs found n models of power systems. Figures 1 and Figure 2 show a transformer model 's view of the con, text and diagram respectively. The model's graphical appearance may be designed n con view. In text view, code will describe the parameters, variables, and equations. In the diagram view, the user may drag and drop existing models (in this case, the connector model) to create a new model. When the contents of each view are changed, two more will be changed at the same time. In model creation, there are three essential concepts to be considered: the definition of class and connectors, statements and equations, and model nitializations.

Classes and connectors

Modelica is object arranged using the idea of "class" to speak to models. One class can ordinarily be viewed as a ndependent model. A "library" can be shaped by gathering essential models, and the models n library can be associated or collected to mplement new models. Associating models s by means of connectors. Connectors are unique Modelica classes, which characterize the standards for the association of at least two segments [2]. As indicated n Figure 1, connector models are utilized for the association of transformer and other force framework parts. Two models of connectors are normally utilized: PwPin connectors for electrical segments and mpin connectors for non-electrical segments.

To interface segments "electrically" by means of PwPin connectors, vr, vi and r factors are determined to introduce the genuine and maginary parts of the voltage and flow separately. To connect the factors, two sorts of connection rules are applied: the correspondence rule applies to voltage factors, and the aggregate to-zero principle applies to current factors, as demonstrated n Figure.3 and conditions.

Declarations and equations

As demonstrated in Figure 1, a Modelica model comprises of a segment on the condition and an area on contention. Model conditions are characterized in condition area. Parameters and factors are pronounced in the Assertion segment as indicated by their information type. No extra factor is characterized for this situation, so the factors in the connector model (p.vr, p.vi, p.ir, p, I) are the transformer model variable. The entirety of the announced factors is autonomous variable time work. The time variable is a worked in include that all models can utilize. Moreover, a model's conditions comply with the idea of a coordinated information stream: all factors safeguard their present qualities until they are explicitly changed, and the relation characterized by the condition must be satisfied in any purpose of time [2, 3].

Initialization of models

Prior to beginning the reproduction for a model, initialization s performed to dole out reliable qualities for all factors gave n the model [2]. The subordinates (der(x)) are respected, during this procedure, as obscure mathematical factors [4]. On the off chance that a model has subordinate capacities, at that point, the quantity of logarithmic factors is more noteworthy than the quantity of initialization issue conditions. Along these lines, extra limitations in the initialization procedure must be given. The model is initialized from a consistent state n most circumstances, which means setting dx/dt=0 as the initial condition. You would then be able to get the initial esteem x0 by fathoming f(x, t) = 0. The statement can be accomplished by inserting the initial condition n the condition area, and by utilizing the articulation start = esteem n the segment of the assertion.

Modelling of Power System Components n Modelica

This part portrays Modelica's nitty-gritty displaying methods and testing results for power framework segments. The demonstrating objective s to fabricate exact and reusable models that can fit well with different models of intensity frameworks. Since certain straightforward models (for example transports, transmission lines, transformers, and so on.) are accessible from past works [5], this investigation centers around displaying control parts n the force framework. Demonstrating is dependent on another programming which is utilized as models n request to show the segments accurately. In this examination the referenced program s PSAT, PSS/E, and Simulink. Since the working techniques for reference programming are fundamentally unique in relation to Modelica, it is important to follow another displaying approach. The measures towards positive displaying are as per the following:

1. Read the prototype specification, grasps the model's conceptual context.
2. Dentify the equations which describe the model's dynamic behaviour.
3. Write Modelica design.
4. Model nitializes.
5. Carry out Modelica model software-to-software testing against the reference model.

A few models are provided n this chapter to llustrate the baseline processes. Templates nclude:

- Synchronous generator models (Software reference: PSAT)
- Turbine governor TG1 (Software Reference: PSAT)
- EXAC1 (Ref: Software: PSS/E) excitation device
- Stabilizer of the power systems (Ref: software: PSS/ E)
- Changers to the load tap (Simulink comparison software)

Power system components modeling principles

The following principles must be followed:

- Defining the model in the most direct and easiest manner possible. Modelica allows a model to be described using other models, enabling the user to easily link models together to create a new model without converting the whole model nto equations. The first step in modeling s therefore to find the most appropriate way of expressing the model.
- Describes and explicitly states parameters, constants and variables. Constants in Modelica don't change over time and can not be modified; whereas parameters are constant over time but can be modified; and variables are varied over time and are commonly used n equations. Model style nputs and outputs have to be specified and described separately.
- Position the parameters on top of a model block sheet. To easily reuse the models, the parameters of the model must be written on the top layer of the block for easy adjustment. To be clearly described and specified.

- Parameters of the constituent components must be propagated onto the top layer, in particular for models made up of other components.
- Use the connectors as nterfaces for nput and output. Before modeling, the model nputs and outputs must be verified, and corresponding types of connectors are used as interfaces to other models.
- Choose the proper method of nitialization. One can initialize models through either auxiliary parameters, or initial equations.
- Descriptive nature of the model's appearance. The model is supposed to be one single block. Unless the model is created by connecting other models, then they have to be aggregated nto one block or symbol.
- Versions are packaged n packages. Kit s an simple way to structuredly arrange templates. Models may be grouped of similar form n one box, which makes it easier to locate a specific model n the applications.

Implementation of models n Modelica

A. Synchronous generators

This section explains Synchronous Generator modeling. in PSAT, two separate generator models are mplemented based on the mathematical models [6][7]. Different simplifications can be mplemented in PSAT generator models, and the models diverge from the basic model with only classical swing equation to an eight-order model with field saturation. Additionally the dynamics of transient and subtransient voltage are considered n the two models described n this section. In differential equations the models differ mainly forth Order.

The fourth-order generator model variables and parameters are detailed in models. Other than parameters and variables, the auxiliary parameters for initializing the variables are defined. After power flow computations the models are initialized. Upon determination of the power flow solution, v0, 0, p0, q0, and v0f are used at the generator bus to nitialize the variables. The nitial values of variables. In this model, in addition to the classical electro-mechanical model, lead-lag functions are used for modeling the inductances d and q-aixs. The dynamics of electromagnetic fluxes was gnored, resulting n a fourth order structure n the status variables π, β, e 0q and e0d. The differential equations consist of:

$$\dot{\delta} = \Omega_b(\omega - 1)$$

$$\dot{\omega} = (P_m - P - D(\omega - 1))/M$$

$$\dot{e'_q} = (-e'_q - (x_d - x'_d)i_d + v^*_f)/T'_{d0}$$

$$\dot{e'_d} = (-e'_d + (x_q - x'_q)i_q)/T'_{q0}$$

Where

$$\Omega_b = 2\pi f_n$$

$$v^*_f = v_f + K_\omega(\omega - 1) - K_p(P - P_0)$$

The voltage and current connections are defined n the equation:

$$e'_q = v_q + r_a i_q + x'_d i_d$$

$$e'_d = v_d + r_a i_d - x'_q i_q$$

Similar to the model of the fourth order, ancillary parameters are specified to nitialize the variables. The model is initialized using v0, 0, p0 and q0 flow solutions. The nitial values of each variable are described n system modelling.

Assuming a field circuit and an additional circuit along the d-axis, and two additional circuits along the q-axis, the sixth order model is obtained [This model s the PSS2B-Dual-Input PSS type of EEE which uses the power and speed or frequency combinations commonly to extract the stabilizing signal [8]. The dynamics of electromagnetic fluxes are neglected, resulting in a sixth order system n the variables of the status π, α, e0q, e0d, e00q, and e00d. The differential equations consist of:

$$\dot{\delta} = \Omega_b(\omega - 1)$$

$$\dot{\omega} = (P_m - P - D(\omega - 1))/M$$

$$\dot{e_q'} = (-e_q' - (x_d - x_d' - \frac{T_{d0}''}{T_{d0}'}\frac{x_d''}{x_d'}(x_d - x_d'))i_d + (1 - \frac{T_{AA}}{T_{d0}'})v_f^*)/T_{d0}'$$

$$\dot{e_d'} = (-e_d' + (x_q - x_q' - \frac{T_{q0}''}{T_{q0}'}\frac{x_q''}{x_q'}(x_q - x_q'))i_q)/T_{q0}'$$

$$\dot{e_q''} = (-e_q'' + e_q' - (x_d' - x_d'' + \frac{T_{d0}''}{T_{d0}'}\frac{x_d''}{x_d'}(x_d - x_d'))i_d + \frac{T_{AA}}{T_{d0}'}v_f^*)/T_{d0}''$$

$$\dot{e_d''} = (-e_d'' + e_d' + (x_q' - x_q'' - \frac{T_{q0}''}{T_{q0}'}\frac{x_q''}{x_q'}(x_q - x_q'))i_q)/T_{q0}''$$

where

$$\Omega_b = 2\pi f_n$$

$$v_f^* = v_f + K_\omega(\omega - 1) - K_p(P - P_0)$$

$$e_q'' = v_q + r_a i_q + x_d'' i_d$$

$$e_d'' = v_d + r_a i_d - x_q'' i_q$$

Turbine Governor

Turbine governors describe the primary regulation of synchronous system frequencies. Figure 5 displays the turbine governor model (TG1), mplemented n Modelica. The reference model is developed originally in PSAT. The model has three nput signals as shown n the block diagram: the actual speed of the rotor, the reference speed of the rotor, and the reference active power pref. The model output s the mechanical power Pm that s to be added to the generator. The governor controls the generator speed by comparing their output to a predefined reference. The governor regulates the speed proportionally to ts power rate when R 6=0 and R< ∞ locally. Two lead-lag filters are used n the mechanical component to stand for servo engine and reheat mechanism.

The Turbine Governor model variables and parameters are described in the system. Also, auxiliary parameters are specified to nitialize model variables. The values at the equilibrium point (e.g. 0 and p0) are the initial values of each variable. The parameter for nitialization is also explained.

The following equations could define the model:

$$p_{in}^* = p_{ref} + \frac{1}{R}(\omega_{ref} - \omega)$$

$$p_{in} = \begin{cases} p_{in}^* & \text{if } p^{min} \leqslant p_{in}^* \leqslant p^{max} \\ p^{max} & \text{if } p_{in}^* > p^{max} \\ p^{min} & \text{if } p_{in}^* < p^{min} \end{cases}$$

$$\dot{x_{g1}} = (pin - x_{g1})/T_s$$

$$\dot{x_{g2}} = ((1 - \frac{T_3}{T_c})x_{g1} - x_{g2})/T_c$$

$$\dot{x_{g3}} = ((1 - \frac{T_4}{T_5})(x_{g2} + \frac{T_3}{T_c}x_{g1}) - x_{g3})/T_5$$

$$p_m = x_{g3} + \frac{T_4}{T_5}(x_{g2} + \frac{T_3}{T_c}x_{g1})$$

Excitation system

Exciter EXAC1 is one of the models of the excitation framework worked at Modelica. The reference model was grown initially in PSS/E [6]. This model s the AC1A model of the EEE structure which relates to an exciter of the alternator-rectifier worked by field. The exciter s made out of a primary exciter alternator with uncontrolled rectifiers. The exciter doesn't utilize self-excitation, so the intensity of the voltage controller is drawn from a source not impacted by outer drifters. The diode trademark in the exciter yield, as appeared in Figure 7 [8], imposes a lower breaking point of zero on the exciter yield voltage. The model has three input flags as indicated n the square graph: generator field current FD, generator terminal voltage EC, and force framework stabilizer (PSS) signal Versus On the off chance that no PSS is mounted on the exciter, versus can be set to zero. Part yield is the voltage field EFD to be associated with the generator. Since the model is initially spoken to by square chart, It is implemented by utilizing built-up parts n Modelica, as indicated in Figure 6.

Power system stabilizer

Another important segment n the force framework s the Force framework stabilizer (PSS). Empowered with PSS, electromechanical motions can be hosed by adding the PSS yield to the excitation gadget as an extra input signal. The reference model was grown initially n PSS/E [6]. Figure 8 shows the PSS model (PSS2B), implemented in Modelica. This model s the PSS2B-Double Information PSS kind of EEE which utilizes the force and speed of recurrence mixes ordinarily to extricate the balancing out sign [8][9].

The model has two nput signals as shown n the block diagram: speed deviation (or frequency deviation) and active power Pe. The model's output s the PSS VOT HSG signal to be connected to an exciter.

Load tap changer

A load tap changer (LTC) s a device for selecting contact points along a power transformer with a variable turns-ratio (or tap changer, .e. n). The role of LTC s to regulate load voltage automatically by switching n. The representation of the LTC transformer effect s especially mportant for the study of phenomena of slow voltage collapse [10][11]. This model can be implemented in Figure 8.

ABSTRACT

Recently developed zero-current-switch quasi resonant converter (ZCS-QRC) provides improved switching condition for the power transistor by reducing its current to zero prior to turn off. The turn on however, occurs, when the full input voltage is applied, to the transistor, resulting in turn on switching losses & noise. Zero voltage switches QRC over com this problem by shaping the transistor voltage for zero voltage turn on. In ZCS-QRC the transistor however suffers from excessive high voltage stress & the converter regulation characteristics & stability are adversely affected by parasitic oscillation caused by the junction capacitance of the irectifying idiode. iA inovel imulti iresonant iswitch iconcept iis iproposed ito iover icome ithe iproblem iof iQRC.The iunique iarrangement iof imulti iresonant inetwork iresults iin iabsorption iof iall iparasitic icomponent, iincluding itransistor ioutput icapacitance, idiode ijunction icapacitance i& itransformer ileakage iinductance, iin ithe iresonant icircuit. iThis iallows ithe inew iconverter ito iprovide ifavorable iswitching icondition ifor iall idevices. iExperimental iresults ishow ithat iZCS-RC iis ibetter ithen iZVS-QRC idue ito ireduced itransistor ivoltage istress, iimproved iload irange i& istability

INTRODUCTION

In ia iconventional iapplications isuch is ispeed icontrol iof ia iDC imotor, ithe iswitch iis iturned ion iand ioff ito icontrol ithe iduty icycle. The iperformance iof iDC io iDC iconversion iis ibest iat ihigh ifrequency idue ito ifollowing ireasons.

1. Continuous conduction
2. Filter size is reduced.

3. Cost is reduced.

Disadvantages of converter

1. It causes EMI problem
2. Voltage stress on the switch is increased.
3. Switching loss predominates at higher frequencies and affect the
4. optimum performance of he converter.

The switching methodologies discussed above are called hard switching as voltages and currents are forcibly interrupted when the switch is turned on and off. This causes switching losses during turned on and off.

In soft switching, the switch is turned on or off when either the voltage or current or both are zero.

In resonant switch converter, inductors and capacitors associated with the switch to cause the switch current or voltage to go to zero periodically.

There are two types of resonant converters
1. zero voltage switching (ZVS) converter
2. zero current switching (ZCS) converter

The resonance frequency is

$$w_1 = \frac{1}{\sqrt{L_r}} \times \frac{1}{\sqrt{C_r}}$$

And normalized impedance is
The resonant voltage

$V_r(t) = I_L Z, \text{ Sin } (w_1 t + a_1)$

Where $a_1 = \sin^{-1}$

The peak value of $V_{C1}$is

$V_1 + I_L Z_1$

Discussion on ZCS QR converter

- Regulation of QRC is achieved by varying the switching frequency keeping the OFF time fixed, i.e the duty ratio is altered by varying the ON period
- For the analysis of the output filter $L_f - C_f$ and load are assumed as a constant current
- The semiconductor switch is operated with zero voltage turn on and turns off
- The switch is required to with stand a forward voltage that is higher than V_1 by an amount $Z_1 I_L$
- This technique is limited to an essentially constant load application

Advantages

- The power losses during turn on and turn off become zero
- These converters have high power density and transfer efficiency
- Filter, inductor or transformer size is reduced
- The EMI is reduced during transition
- It can withstand short circuit conditions

Disadvantages

•They are regulated with variable frequency controller

•Switching loss predominates at high frequencies and affects the

•optimum performance of the converter.

From the output waveform it is seem that immediately after the diode current reduces to zero, voltage applied to the diode changes abruptly from zero to V_1. In practice such an abrupt change induces parasitic oscillations between the resonant inductor and diode capacitance as shown fig. Below.

•During conduction of b, the current through the switch and voltage across the diode are oscillatory.

•ZCS-QRC is extensive voltage stress at the switching transistor

RESULT ANALYSIS

In voltage switching converters as the switching instance is just at zero crossing the harmonics is significantly reduced. The total harmonic distortion of converter is also reduced.

CONCLUSION

The overall device life is increase due to better switching frequency Thus such arrangement will give better stability to control circuit.

ABSTRACT

Zone division in Power System is critical to maintain power quality & security of system. It is also necessary for disconnecting healthy operational part from faulty part in general operating condition. The zone division in Power System is done by proper selection and placement of current transformer(CT). So when the CT becomes saturated the zone protection could not be realized due to malfunction of relay &parameter decentralization. The paper mainly focuses of CT saturation & its impact of Bus Zone protection Power System.

Keywords : CT Saturation, Knee Point Voltage, Bus-Zone Protection, Impedance measurement, Saturation Flux.

INTRODUCTION

In modern Power System protection & measurement plays an important role in stability of grid. This can only be achieved through accuracy & speed of operation. With state-of-the art development in electrical manufacturing sector the texture of instrument transformer is also modernize to fulfill the requirement, looking to recent development optical fiber CTs are replacing conventional CTs, but it has its own challenges. As the process of development is gradual, the presence of conventional CT cannot be ruled out. So for a healthy system operation fast & accurate CT operation is critical.

Current transformer is a type of instrumentation transformer which is used to convert higher level current up to a level workable for protection, measurement and control setting. It produces a secondary current which is proportional to the current in the primary.

Current transformer insulates the secondary side from the high voltage of the primary side so that the secondary side is not exposed.When saturation occurs due to fault in the transmission line, the relay that is connected to the transformer cannot operate properly.The secondary current is mainly used for the purpose of metering and protection.For protection less accuracy in CT is required as compared to the metering. In this paper distance protection system is connected with CT. So, accuracy of the current transformer not a major factor as the metering.

THEORY OF CT SATURATION

To understand CT saturation, first we have to know about the concept of working of CT, why does it saturate and what is happening after the saturation.

Working of CT

CT consists of two windings, secondary winding is around the core and the primary winding acts as a primary conductor passes through secondary. When current flows in the primary winding,alternating magnetic field is generated. This leads to the generation of alternating magnetic flux around the transformer core that passes throughthesecondarywinding.If a burden is connected in secondary, analternating voltage is created by the magnetic flux across the secondary. This generates analternating current to flow in the secondary side, which creates its own alternating magnetic field and alternating magnetic flux that oppose which created by the primary. This results in cancelation of fluxes and leaving a net flux of negligible amount in the core.

So, basically CT is a type of transformer that produces a current in its secondary which is proportional to the current in the primary.

Figure (1) shows an equivalent circuit diagram of CT. Where I_p(the primary current), I_s(the secondary load current), I_0 (the magnetizing current) N_1 and N_2 represent the turns ratio of the CT, and the ratio current $I_{st}$is the primary current divided by this ratio.

The resistance R_{ct}represents the secondary winding resistance of the CT and R_{load}represents the resistance of the load. Here R_{ct}value is constant whereas the value of R_{load}varies according to the load.

In CT the constant currentsource $I_p$drives the total secondary current $I_s$as determined bythe turns ratio. $I_s$is the current that is measured by the load ifthe CT is ideal.

Current Transformer Saturation

If an open circuited condition occurred on the secondary of CT, in thesecondaryside very high alternating voltage flows due to the alternating magnetic flux.This results in high burden on the secondary side, creates a low impedance path due to fault conditioncauses a very high primary current, which leads to the saturation of the current transformer.

When CT gets saturated they can no longer maintain the current ratio between the primary and the secondary winding. Saturation may leads to malfunction of the protection devices as the measured current does not correspond to the current on the system.

SIMULATION OF CURRENT TRANSFORMER SATURATION

Figure (2) represents the MATlab simulation of a current transformer where there is connection between the source and output voltage and current. A voltage source of 120 KV is connected to the primary side

of the current transformer through a circuit breaker. The rated current of the current transformer iss 2000/5.

The turns ratio of the transformer is repsented by,

$$N_1 I_P = N_2 I_S \qquad (1)$$

Where N_1= primary turns and N_2 = secondary turns

The primary of the current transformer is taken as 1 turn. That means seconadary current is fixed as 5A and so accornding to equation (1) , the secondary turns is 80 turns and 400 A current is flowing in the primary side.

The output current and the flux can be represented by using the scope connected in the Simulink block. By using this block we can observe the behavior of current transformer for both normal and saturation condition.

Figure (3) explains the generated secondary current of the transformer without saturation. It can be observed from the graph that the variation in curve is synchronized with time which indicates that ratio transformation is occurring in a smooth way, i.e. as per the current level in the line, the replication in reduced level as per ratio is availed for protection & measurement

Figure (4) explains the generated flux of the transformer due to the secondary current and can be measured by using the multi-meter. It can be observed from the curve that the envelope reduction is gradual with diminishing margin in positive and negative quadrant. With diminishing marginal shifting there will cause heavyfluctuation of current, this will lead to unnecessary relay actuation & circuit breaker triggering.

Figure (5) explains the influence of current saturation on the secondary current of the transformer. It clearly indicates that during saturation the peak current value reduces drastically and varies in-uniformly w.r.t. time. That is in spite of standing ratio the current value does not change accordingly as it should be.

Figure (6) explains the effect of current saturation on the flux. It indicates that the exchange of flux becomes constant after excitation flux reaches knee point voltage as shown in graph the flux increases to peak value as remains constant in positive quadrant w.r.t. time period without any variation or negligiblevariation, for which there will be no mutual exchange of flux form Ct core to secondary. Which will leads to excess accumulation of charge in CT core, resulting in heating of the core.

IV. Power system And Current Transformer with Bus Zone- protection Simulation Block

This block consists of a 120 KV line-to-line sourcevoltage, transmission line and a CT with current saturation effect on power system and distance protection system.

This paper explains the behavior distance protection system under the influence of CT saturation. The simulation of the power system contains the source and the CT. The current signal moved from the CT to the distance protection block. Its simulation graph is given in figure (9,10).

Distance Protection Block

Distance protection is designed to detect the faults which occurred in the transmission lines.The main functions included in the digital relay model are detection of faults, measurement of impedance and Zone protection.

Detection of faults

The relay allows the direct detection of the faulty phase and tripping of the appropriate distance measuring zone. Without phase selection under reach or over reach problem might occur.

Impedance Measurement Block

The impedance measurement block consists of subsystem used to calculate the fault impedance of single phase fault. The block uses an algorithm for the fault detection shown in equation (2).

$$Z_{slg} = \frac{VA}{IA+3K_0I_0} \quad (2)$$

$$K_0 = \frac{Z_0-Z_1}{RZ_1} \quad (3)$$

$$I_0 = \frac{V_s}{Z_0+2Z_1} \quad (4)$$

Where,

Z_{slg}= single line to ground Fault impedance
A = phase where fault occurs
VA= phase voltage
IA = phase current
Io = zero- sequence current
Zo = zero-sequence impedance (75 ohm)
Z1 = positive-sequence impedance (50 ohm)
K = residual compensation factor (taken as 0.9)
Vs = phase voltage during the phase to ground fault

Zone protection

The distance protection system divides the transmission line in to different zones. Zone1 covers up to 80 percent of the first section of transmission line. The setting of the next zones depends on the length of the remaining sections of the line. Zone 2 covers up to 120 percent (Zone1+20%)and Zone3 covers up to 240 percent(zone1+zone2+20%) of the first section of the transmission line.

RESULT AND DISCUSSION

Fig.9 and Fig 10 show the parameters of the designed distance protection which cover different parts of transmission line under study. The figure (9) explains the behavior of different parameters in a power system where distance protection is connected and the CT is operated without saturation. The figure 10 shows the behavior of the parameters when the CT connected to the power system in under the influence of saturation. Current saturation leads to an error in the calculated fault impedance (Zslg) and also there is an error occurred in the algorithm which is used to calculate the fault impedance. Due to this error, the distance protection is not working as it should.

CONCLUSIONS

The CT saturation could force the distance protection, because of the algorithm which is used for the calculation of fault impedance in the protection system. This algorithm is using both the current and voltage signals. The saturation effect in CT has resulted in a failure in the calculation. This error leads to the problems in functions of the protection. So the CT saturation boost the measured impedance in the system.

ABSTRACT

Generally we are going to think about modernizing today's grid, we have to first of all have a clear idea about the requirement of power system in future. Smart grid is going to be the basic activity for the future developed society. Utilities across the globe are trying to find out new possibilities to bring there distribution network into the current era of digital network. By doing this they can convert the convention "power grid" into a "smart grid". By digitalization of grids the carbon foot prints of the grids can be minimized and the control over these smart grids can be achieved by new information and communication technology (ICT). When smart grid comes to picture it provides some advantages like easy integration and reliable services to the customers. A smart grid system is a system which is self-healing, self-monitoring and self-conditioning by the help of automation at each level and also it will provide reliable, security, qualitative and safe power to all consumers. This paper is a fundamental assessment of the smart grid definitions, features and technologies of the system. Moreover, this paper compressed the smart grid technologies and their advantages in various regards.

Keywords : Smart Grid, Advanced metering system, monitoring and control system

INTRODUCTION

The basic idea of smart grid is to achieve reliable, control over the flow of power or good power management. The information can be processed to re-route the electricity around the problem spot until the problem is solved. The smart grid can accommodate solar and wind power into the conventional power system. Dynamic tariff can be employed by the use of smart grid technologies. The smart grid is a automated system in which the system is capable of rapidly respond to the changes in condition. The smart grids are predictive and forcastive in terms of predicting the equipment maintenance time and forecasting the life of equipment. Today's power system is designed

for one way transmission of power from the generating stations to the consumers. But in the future it will be two way systems where small distribution units are distributed over the whole country and smart grid is the best solution to serve the problem.

SMART GRID EQUIPMENTS

Modernize smart grid can be achieved by, a wide range of technology which is to be developed and also it should be implemented. The technology are generally grouped into following areas:

Intelligent devices: Intelligent devices should be able to understand and decide at when and which moment to consume energy based on consumer load demand. In this way, these devices lead to go away from decreasing in peak loads which have an impact on generation of electrical costs. For example smart sensors(moisture, temperature sensors, etc).

Smart meters: Smart meters avails two-way communication between power distributers and load end consumers for automatic data collection of billing, detection of equipment failure. It also provides security and load control function.

Smart substation: Substation are used to control and monitor the critical as well as non-critical operational data such as status of power, performance on power factor, breaker, security, safety, etc. Substation are used for transferring voltage from one place to another that provide reliable and safe transfer of energy.

Integration of communication: It is the best part of smart grid technology i.e. integrated communication. It is faster as compared to real time operation of system. According to fulfil the need of consumer demand, communication can be like PLC, SCADA, BPL.

PMU (Phasor Measurement Unit):- It is used for the measurement of electrical waves on electric grid by using a common time source for synchronization. The time synchronizer allows real time measurements of multiple remote measurement points on the grid.

FEATURES OF SMART GRID TECHNOLOGY

- Advanced metering infrastructure system
- Consumer side coordination
- Improvement in transmission line appliances
- Distributed management system
- Information and communication technology
- Combination of renewable energy
- Monitoring and control system

Advanced metering infrastructure system

AMI describes about the two-way communication control and allow consumers and public servant to get the operation of real time cost and energy consumption. It specifies energy loss and finds the location where the electrical theft has occurred[2-3].The system can improve public service operation and help the development of AMI data management to enhance customer reading. AMI provides a fundamental link fixed between the network, customers with their loads and generation as well as storage space resources through the merging of different technologies such as intelligent evaluation, starting zone system, coordinate exchange, data management application and institutionalized programming interface [4]. In the execution of AMI the risk of communication, which is a

specific aspects consolidated in the smart grid and evil the national economy, general security, government conviction and public protection with environmental reliability [5]. As a result, the system security prerequisites must be proposed and distinguish which electrical network security goals are planned to be expected [6].

Consumer side coordination

Consumer-side coordination updated to monitor electrical consumption at the consumer level such as industrial and residential level. There are some points which are committed consumer's side coordination that are[7-8]:

- Energy storage device
- Energy management system
- Intelligent electronic device
- Distributed generations

The monitors that are used in home are pre-paid cards, smart electronic and electrical devices and cargo storage which could speed up the energy efficiency and consumer's demand [9]. At the side of end customers, the customers reduce their energy consumption in the cause to need the power grid. When we go to see the side of manual-to-customer reaction, the programmed, the internal controllers and the evaluated devices are associated with the energy management techniques or controlled by utility program and system supervisor[10].

Improvement in transmission line appliances

Different types technology that are used in transmission line to improve the controllability, ability to exchange and decrease in energy loss. There are some applications that have occurred are[11-12]:

- Flexible Ac transmission system(FACTS)
- High voltage DC system(HVDC)
- High temperature super conductors(HTS)

Distributed management system

DMS function is through processing of real time operation; smart meters, advanced sensors for [13]:

- Detecting fault location
- Improvement in energy management
- Optimizes voltage and reactive power
- Maintaining the voltage level
- Reduce interruption and repair time
- Reset the power supplies automatically

Information and communication technology

The work of ICT is to assist the communication of data for the activities granted and continue during interference. ICT is not to concentrate the communication network that are used in privately (metering work system) or public (mobile phone, link and web count)[14].

Combination of renewable energy

Renewable energy assets spread at various level of energy network: Extensive scale renewable power source assets at the transmission level, medium scale appropriation and little scale in the customer's parallel structure[15]. The capacity to control and dispatch remains the principal challenge for the for the reconciliation of renewable power source and energy assets distributed in the activity of electrical system. Both electrical and thermal energy storage plans can reduce the effect of variable renewable power source for wind and solar energy. Distributed generation integrated can enhance the power quality of power network and decrease the substantial loads[16-17].

Monitoring and control system

There is huge area of monitoring and controlling all parts of the power system and continuous execution through interconnection inside extensive geographic areas and enhances the role of power system and execution to help through framework administrator to understand them[18]. The progressed working frame work equipment including the broad area situational mindfulness, wide area monitoring framework and wide area versatile security, control and computerization, keep up a separation vital power outages and encourage the mix of variable sustainable power source assets. Also the information created by the monitoring, estimation and control frameworks of the expanded area could also encourage the activity of the structure together with [19]:

- Reporting on the decision making process
- Attenuation is extended area dispersion
- Improved transmission capability with reliability[20]

APPLICATION

- To improve the adeptness of transmission lines
- Cost reduction
- Reduction of peak demand
- Quick recovery after a sudden breakage/disturbances in the lines and feeders
- Smart grid possess the ability to be integrated with renewable energy resources on a large level which leads to sharing of loads and reduction of load on large scale.

BENEFITS

1. Reduction in carbon emission
2. Better quality of power
3. Better supply for consumer demand response
4. Increase in demand for energy
5. To integrate isolate technologies
6. To protect electrical network during emergency situation.

ADVANTAGES OF SMART GRID

The advantages of smart grid network can increase the operation of the system and it consists of:

Reliability: - The rate of decreasing the interruptions and the quality of energy. Also to reduce the possibilities and there is a penalty for generalized blackout.

Efficiency: To minimize the losses, cost to generate, for transportation purpose and consuming the electricity.

Security: To protect against cyber attack and natural disasters, decreasing in the chances of possibilities and consequences of assaults caused by imitate fraudulently and also by causing sudden great damage or failure in system.

Safety:- Decrease in fault occurrence and death toll from network related events in general.

Economy: Keeps prices in low electricity cost reducing the total amount paid by the consumers on the network, creates new jobs and stimulates total national production.

DISADVANTAGE OF SMART GRID

1. Availability of continuous communication network.
2. Due to sudden change in situation, smart grid network or performances become challengeable condition in this system.
3. The cost of smart meter become more expensive as compared to traditional old electricity meter.
4. There is some possibility of hacking the smart meters which can be used to increase or decrease in consumer demand.

CONCLUSION

This paper is a fundamental assessment of the smart grid definitions, features and technologies of the system. Furthermore, the contrasts between a conventional grid and an intelligent grid analyzed. Moreover, this paper compressed the smart grid technologies and their advantages in various regards. Energy management methodologies, challenges, and implementations are reviewed in this paper too. This work has tired the development of the smart grid from the need to modernize the electric grid. At last, the conventional network was limited and required more capacities. The features and characteristics of intelligent grid systems have recognized. This paper displayed the intelligent operation of the key and related technologies and distinguished the assessment activities, challenges, and issues spinning around them. There is opportunity about circumstances in the regions of time arrangement expectation in smart grids, reliability, and power quality examinations, energy flow optimization, battery frameworks, cloud assembly, and energy integrating sustainable on an extensive scale. Indeed, even the issues and challenges recognized as information security, physical and
Cybersecurity, test system barrier and the automation of the delivery system can be great beginning stages for future research.

ABSTRACT

As industries grow and begin to globalize their products and services, employees need to be equipped with effective communication skills and English has emerged as the language of international communication. This has accentuated the need for good English language communication skills. Most employees who join business organization possess good technical knowledge and skills but there is a perceptible lack in their ability to communicate fluently and effectively. English language proficiency is integral to inter-organizational and intra-organizational communication. Employers consider communication skills to be one of the important skills for effective performance at work. In the corporate sector the language used for communication needs to be clear, direct and simple and responses need to be quick and prompt. Lack of language skills can be seen to have a negative impact on an employee's accessibility to communication networks; the possession of the relevant skills can facilitate inter-unit communication flow. The study is an attempt to identify the current language skills of the business executives and difficulties they face during the use of the four skills such as speaking, writing, reading & listening in English. Special attention will be paid to the relationship between executives; sociolinguistic backgrounds and their ability to use English in their jobs.

Key Words: Business Executives, Sociolinguistic Profiles, Corporate Sector, Language Skills, Speaking, Reading, Writing, Listening.

INTRODUCTION

Although proficiency in English is essential for business executives as mentioned above, there are many business executives in India, especially with mother-tongue or regional medium background, who have difficulties in coping with the current requirements of the English language. These business executives include professional students who

are going to step into the realm of business, self-employed professionals, 'pre-experienced' (or 'low-experience') and, sometimes, 'job-experienced' (Ellis, M. and C. Johnson: 1994:5) executives.

For Instance, there are several management, finance, marketing and engineering graduates struggling to secure a suitable job in an organization because they are not proficient in English. Similarly, there are also pre-experience business executives with English medium background who do not have the required competence in English to transact their business dealings. There are also job-experienced business executives who are not proficient enough in the use of English. Usually, job-experienced learners gain the required knowledge in the use English because of their practical experience on the job. However, there is no guarantee that pre-experience learners will be competent in the use of English once they acquire a few years of experience on the job. As Singh (1998:8) observes, it is assumed that the candidates will pick up English as they go along with their relevant job. It is true that some executives benefit from the use of English in real life communication situations, yet they cannot become confident users of English, despite an adequate interactive environment in English . Many factors inhibit the development of their use of English. These factors include their inexperience in the use of English due to the grammar-translation based schooling in English, hesitation, fear of ridicule from peer group or buyers, etc.

LITERATURE REVIEW

Training in business English in the Indian contexts has been a little researched area in India. The research done in business English does not focus on the actual language need of employees of their on-the-job work performed. As mentioned earlier not much research has been done in areas of corporate language training.

Usha Kumar (1978) analyses the letter writing skills of commerce student. Her study aims at making the reaching of an English purposeful by giving it a vocational bent and relating it closely to the demand that are made on it by the students of commerce. Kumar in her study '*English for Business'* states that '*no serious attempts have been made to assess the need for English in business'*. English is not given enough importance at the graduate level in commerce with the results that it has become an accessory.

Kumar (1978: 80, 90) also mention the different between 'education' and training. She write, "while the language syllabus in a school of a humanistic model i.e., education oriented, in colleges it should be of a technical model i.e., training oriented."

Aim of the study

Many business executives in India do not seem to possess adequate communication skills in English and, consequently, do not appear to be satisfied with the way they are dealing with people and work on their job. A business executive may have a clear business vision, business strategy and an adequate preparation for the new challenges in the ever-changing scenario of business environment. But, if he does not possess adequate communication skills in English, it is very likely that he may not be able to achieve his business goals.

There is no specialised academic course in English at undergraduate and postgraduate levels for students who wish to pursue a career as business executives in their chosen fields. The initial induction training imparted to business executives in some organizations usually does not focus on communication skills in English. Therefore, there is a need for a specialized course in English for business executives in India. And, there has been very little research in India which has focused on all four skills, viz. speaking, writing, reading and listening skills, keeping in mind the sociolinguistic backgrounds of business executives. These factors play a significant role in the business executives' ability to use English. Therefore, a specialized course for business executives with a reappraisal of the course objectives and content seems to be necessary The present need is to provide functional competence in English to business executives, in a limited amount of time with practical classroom methodology so that their lack of functional competence in English does not impede their progress on their job. Therefore, the present study sets out to:

Re-identify the English language needs of business executives in the present changing scenario

Due to the constraints of time and space, the present study is, however, restricted to the needs of the business executives working in different national and multinational companies located in Raipur, Nagpur, Hyderabad and Bangalore only where executives from different parts of the country work.. The study is also based on certain assumptions which are described in detail in the following section.

Importance of English for business executives

English is very essential for business executives for various reasons as mentioned earlier . Although various studies focused on the productive (i.e. speaking and writing) skills only , the present study emphasizes the fact that the productive skills as well as the receptive (i .e reading and listening) skills are equally important for business executives, as a majority of the executives felt it so (see table 1 below). It is felt that the rapid changes in the business environment are the main reasons for bringing about equally significant demands for reading and listening skills. Indeed, the productive and the receptive skills usually do not exist in isolation from each other, but are interrelated with each other.

Further, a business executive is expected to speak fluently, write effectively, listen and grasp attentively, read and comprehend accurately and quickly, but it was found that many executives had difficulty in using English in their job. Their specific difficulties in their job are discussed below.

Difficulties business executives encounter in English

It is evident form table 1 above that English is very important for business executive and a majority of them do use English at work. However, it was found that out of the sixty business executives interviewed, 38% (i.e. 23 executives had difficulty In speaking, 38% in writing. Similarly, many of them also had difficulties in listening and reading in English as the following table shows:

The nature of difficulties the executives face in the use of English and the reasons for the difficulties are discussed below in separate sections.

Speaking: Common difficulties

Some of the common difficulties business executives encounter while speaking in English, as the following table indicates, are speaking grammatically correct sentences, using appropriate vocabulary, speaking fluently, speaking with correct pronunciation and speaking with confidence.

A majority of business executives who had difficulty in speaking in English said that inadequate knowledge of grammar was the major reason for their difficulty. Similarly, among the 23 executives who had difficulty in speaking, 96% of them (i.e. 22 executives) found it difficult to speak in English because of inadequate vocabulary.

The underlined sentences in the conversation shows the ignorance of the business executives about correct grammar and syntax.

Q. Do you think you are not able to manage your business satisfactorily because of your lack of fluency in English?

A: Yes customers feels happy when we speak in his own language. Because, he could understand very deeply about the product when we explain in his own language only .Generally, customers influences when a shop owner or a businessman approaches, he would like to have been addressed in his own language.

Q: You said you have problem in speaking in English .Then, how do you manage your English when you have to speak to your important customers in English?

A: I'm managing with simple English. If I am not expressing my thoughts, I am always switch on native language.

Q: Could you just tell me how much and in what way English is important to you in your job?

A: Of course, it is very much essential for a professional like… English is very much important as it is an universal language which can be communicated in a better way.

Q. You've mentioned in the questionnaire that speaking in English is somewhat difficult to you, so, does it affect your job to some extent?

A. In my case it is somewhat different as I said because in my school and college days I was not so interact with students who are having good conversation in English and as I studied in a government school there was no opportunity to develop my English. If I could have been from convent or standard school where speaking in English is compulsory there might be a chance for commanding myself in the language.

Q: You've mentioned you have also some difficulty in reading. then, it affect your performance on the job while you correspond through e-mail ?

A: Not much. Because I would have been able to speak or write good English ,it would have been more impact on the receiver's end rather than at my end.

It is evident from the above examples that some executives lack adequate knowledge in grammar and vocabulary. It is also apparent from the above that the errors in grammar are part of both complex as well as basic grammar rules.

Further, their difficulty is compounded by incorrect pronunciation, poor knowledge of basic grammar, lack of confidence, etc. Among the 23 executives who mentioned that they had difficulty in English , the data suggests (see table 3) that 87% of them (i.e. 20 executives) found it difficult because of lack of fluency, 78% (i.e. executives) because of incorrect pronunciation and 57% (i.e. 13 executives) because of lack of confidence.

Writing: common difficulties

A business executive who is part of the middle or top level management in an organization is expected to possess good writing skills in English. However , the data indicates (see table 2 above) that out of the sixty business executive interviewed, 38% (i.e.23 executives) found it difficult to communicate in writing properly. Surprisingly, all these 23 executives who had difficulty in writing said that using appropriate vocabulary was their main problem. Of these 96% (i.e. 22 out of 23 executives) indicated that writing grammatically correct sentences was their main difficulty .Similarly, 74% (i.e. 17 out of 23) mentioned sequencing of sentences and 52% (i.e. 12 out of 23) mentioned organizing paragraphs and using appropriate sentences to close a letter as their difficulties in writing in English. The following table sums up these details:

The following are some examples of sentences which contain errors of vocabulary and grammar used by some of the interviewees, these sentences are taken from both their work places and the answers they wrote in the questionnaire 1

The manufacturing facilities existing at the time of visit of your survey team was lacking to cater the needs of our customers…

If you starts this proficiency course that will be helpful business executive. because they will learn…

We look forward to hear from you a positive response….

We herewith sending a proposal relating to….

We are requested to go through the letter and send your consent for above proposal.

We can attract the parties by writing this type of drafting it is necessary are for exclusive business executives.

Every parents should encourage their wards to speak in English by conversing a minutest matter in English…Simply sending their ward in a public school won't make their sons/daughters English literate.

Proper information cannot be obtained by filling up this questionnaire. This kind of method may required a little changes . Ex surveyors shall be in front of responsee and note the a clear ideas from the person whom he wants to be interviewed.

Having discussed the speaking and writing skills of the executives, let us now move on to another important area---the reading skills of the executives.

Reading: Common difficulties

From the data it is evident (see table 1) that 88% of business executives (i.e. 53 executives) considered reading skills as important to them on their job. Some of them mentioned that they often browsed the internet for information related to their business activities. Most of them also mentioned that they read technical or professional journals, magazines, books business newspapers, the usual business correspondence such as letters, fax and e-mail.

However, the data indicates that out of the sixty executives interviewed, 28% of them (i.e.17 executives) had difficulty in reading comprehension (see table 2). Their responses to certain questions in the questionnaire were neither appropriate nor relevant. That is, they were not able to grasp the content of the questions properly which reveals their inadequate reading skills. For instance, some of their responses to certain questions were as follows:

Q: When are you required to speak in English on your jobs?

Q: Which of the following functions/tasks do you (have to) person through SPEAKING in English on your jobs ? And how frequently do you (have to) perform them ?

A: In today's competitive environment speaking in English is most essential.

Similarly, in the following context, the reader instead of writing about the nature of difficulty wrote about the way he communicated in English:

Q: If you have a difficulty in speaking in English, what are your difficulties?

A: I communicate fluently with people with an intention to make them understand.

In the following two instances again, the reader has failed to understand the key words "what reasons "in the given question:

Q: what do you think could be the reason(S) for your inadequate oral communication skill in English?

A: Every time, at every level I try to improve my communication skills.

Q: what do you think could be the reasons (s) for your inadequate written communication skills in English?

A: Yes, please conduct a course.

Having discussed the difficulties related to speaking writing and reading skills of the executives, let us not discuss the difficulties related to the listening skills of the executives.

Listening: Common difficulties

Almost 92% of business executives (i.e. 55 executives) felt that the listening skills were important to them (see table 1) Business executives have to listen to and grasp quickly what their customers or clients, superiors, colleagues, etc. say to them. They listen to lectures in formal seminars and meetings as well. They also have to listen to railway announcements, flight announcements, etc. apart from listening to the radio and television.

Out of the total sixty executives interviewed, 32% (i.e. 19 executives) mentioned that they had some sort of difficulty in listening comprehension (see table 2).

The data indicated that some of the common difficulties business executives faced in listening comprehension was that they were not able to understand quickly the speaker's pronunciations, sentence structure and communicative

value of the utterance. Inadequate vocabulary was also one of the reasons for the executives' difficulties in listening comprehension.

Some of the interviewees also felt that the difficulty to listen and comprehend quickly increases as the speakers usually vary in the way they speak because of the differences in their mother tongue, educational background and geographical background,

CONCLUSION

The importance of a specialized course in English for business executives cannot be denied. And, rightly so, a majority of the interviewees, that is, about 80% (48 executives) indicated that there should be specialized course in English for business executives.

On the other hand, it is surprising that only 12% (i.e. 7 executives) had an induction programme / initial orientation training programme in their organizations which included a course in English. They also indicated that they benefited a great deal out of such a training course which aimed at all the four skills, namely listening, speaking, reading and writing.

Similarly, those who said there should be a specialized course in English for business executives also indicated that such a course should comprise all the four skills.

Some of their responses in this regard, in their own words, are as follows:

A proficiency course in English is very helpful to business executive. They can improve their listening, speaking, reading and writing skills

People should be trained in the ways to address colleagues, seniors and clients. For Example, in our country many executives use the word "sir" to every sentence while speaking to their superiors. Thus business executives also need to be trained in communication skills.

Even though most business executives come to business mainly after their graduation, it is not ruled out that some may come even without any formal education and rise to the level of top management. Therefore, I feel, there should also be separate English language programme, specially designed for business personnel without any formal education.

If there is a good course in business English it is useful to people like me. We can improve our English and deal better in business transactions. However, such a course should be very practical. It should also emphasize writing, reading and listening practice.

The above responses reveal the significance of a specialized course in English for business executives. It is also clear that such a course should comprise all the four skills, viz. speaking, writing, reading and listening.

ABSTRACT

English language plays a pivotal role in the academic and professional careers of students, especially those pursuing graduate courses in the areas of sciences and technology. Due to the emergence of globalization and commercialization, a lingua franca is the need of the hours and English language has emerged as an alternative for the trade and commerce language across the globe. Thus, there is a significant need to ensure that language curriculum for science and technology students must be based on their language needs and requirements. The paper makes an attempt to define language curriculum in the context of science and technology and highlights some implications EST teachers. In the process, three approaches to language curriculum has been discussed. Process approach has been suggested to be adopted in designing EST curriculum which would ideally encompass all the best features of the three approaches.

Key words: EST, Language Curriculum and ESP students

INTRODUCTION

The paper begins by describing what the basic features of curriculum. A broad discussion has been attempted to find out the appropriateness of the given explanations. After a thorough discussion on curriculum, a detailed discussion has been made on various approaches to language curriculum design and provides rationales for the relevance of process approach for EST students. Further, a few suggestions have been offered to the EST teachers for successful delivery of the curriculum.

The concept of a language curriculum

The word 'curriculum' has been used differently by different experts in different ways. In its narrowest term the word curriculum is synonymous with syllabus, but in a wider sense it is more than a list of subjects, rather it

includes planning, implementation and evaluation of educational programme.Kelly (1989) provides a wide-angle view of language curriculum.

> "…the intention of the planners, the procedure adopted for implementation of those intentions, the actual experiences from the people resulting from the teachers' direct attempt to carry out there or the planner intention and the 'hidden learning' that occurs as a byproduct of the organization of the curriculum, and, indeed of the school". (Kelly, 1989, p.14)

It is significant to note that curriculum in a broader sense in not a list of topics to be transacted in the classroom but there is a 'hidden learning' which highlights that the focus of a curriculum is not on 'teaching' but in the process of learning the set objectives. Nunan (1988, p. 158) also supports a broad view of curriculum.

> "…the principles and procedures for planning, implementation, evaluation, and management of an educational programme. Curriculum study embraces syllabus design (the selection and grading of content) and methodology (the selection of learning tasks, and activities".

Nunan (1988) believes that curriculum is not simply a list of subjects but it entails many more aspects i.e. planning, it may be carried our according to the needs of the learners; implementation, it takes care of appropriate way of enacting a curriculum; evaluation, it helps us how effective the earlier two principles are and finally management of the whole educational programme. It has been highlighted from the definition that curriculum goes beyond classroom happenings; it is beyond teaching and learning. Nunan (1988) not only focuses on the planning part of the curriculum, rather the process and procedure of implementing curriculum.

According to Richards (2013), 'The Forward Design Process' focuses on the linear approach to curriculum design where the content is pre-determined prior to a course delivery and it is The graded from simple to complex. It focuses on the teacher centred approach to classroom where teachers are expected to present explicit rules. However, The Central Design Process is activity-based and do not follow a linear progression. It is a process approach to language curriculum, where the content and sequence evolve in the classroom. Meaning is given more importance in this approach than accuracy and thus activities involve generating meaning rather than rules. In 'The Backward Design Process', the course is based on need-based and competency based. Like 'The Forward Design Process', 'The Backward Design Process' is based on a linear progression where the content is pre-determined prior to the delivery of courses.

English for Science and Technology (EST)

English for Science and Technology (EST) is part of language for specific purpose movement where English language is delivered keeping the specific needs of the science and technology students. English for Specific Purposes (ESP) is another synonymous term used. As per Hutchinson and Waters (1987), ESP courses are 'need-based' and what makes it different from English for general Purposes (EGP) courses is the 'awareness of needs'. Being adult learners, EST students are aware of their language needs.

Implications for language teachers and students

The role of teacher has been undergone a tremendous change. Teachers are expected to perform many other duties apart from transacting knowledge. Apart from an instructor, model and explainer, teachers need to prepare themselves for other roles. One of the key roles of a teacher is be a 'negotiator' who should consistently negotiate in the process of learning. Further, teachers need to ensure that learners express themselves and develop a sense of autonomy.

The role of students has also changed. It is not just learning which is important, but 'learning how to learn' has larger significant. Learning should be a fun activity which can be achieved through 'negotiation' and 'experiment'. Further,

EST learners being adult learners must take the onus of their own learning. The learners must involve themselves actively and practice language both inside and outside classroom.

CONCLUSION

It can be observed that there are various approaches to language syllabus design. It includes process approaches; The Forward, The Central and The Backward as proposed by Richards (2013). It is not feasible to decide that which is the best and suitable for EST students as the needs of learners vary from time to time. It is up to the teachers to decide which approach suits the needs of his/her students. An eclectic approach can also be experimented where components from all the approaches can be taken.

The following factors need to be considered before deciding which approach to be undertaken.

- Learners' academic and professional language needs
- Learners' learning strategies and motivation
- Teachers' language proficiency
- Assessment and evaluation process

ABSTRACT

The present research aims for modelling and simulation of solar tree which is installed in a pole mounting structure. Solar tree is an alternative method to flat type of roof mounting structure which requires more space. As per latitude of Bhubaneswar location (20^0 N), it was faced towards south and installed near Traffic side. The simulation of pole mounting structure was carried out and maximum deformation and stress were calculated. It is used for domestic lightning purpose during night time. The material of mounting structure was taken as stainless steel and main components are Solar PV panel, charge controller, battery.

Keywords : Solar Tree, pole mounting structure, maximum deformation, maximum equivalent (Von-mises) stress

INTRODUCTION

D.M.Patil et al [1] developed a solar tree which was an alternative for roof top mounting structure. This was used for domestic purpose and by using tracking system the performance was also increased. B.Ayneendra et al [2] designed a solar tree with a proper sizing of PV panel, battery, and charge controller and to increase the performance. H.Khan et al [3] developed a solar tree which uses a pole mounting structure whose main objective is to reduce the land area and to use efficiently. S.S Awaze et al [4] designed a solar tree which consists of number of solar panel integrated in a same pole mounts and installed at the site of traffic. A.P.Srinivas [5] developed a solar which consists of numbers of solar panel connected in series and parallel to generate electricity and supplied power to CFL lamp of 5 Watt. V. Avdic et al [6] designed a solar tree by using CAD software for which was a solution for urban use.

Photovoltaic Mounting Structure

The mounting structures are classified as Ground mounting structure and Roof mounting structure. Again ground mounting structures are classified as pole mounts, foundation mounts and ballasted footing mounts which does not require any excavation. Flat roof solar installation requires the three techniques such as Ballasts or weight, mechanical attachment and Hybrid mounts. Ballasts technique is used in low wind zone. Mounting Rack materials such as Aluminium and stainless steels are used due to their strength and corrosion resistance. These are the following steps for installation of mounting structure.

- Solar Panel direction should be tilted at around 15-20 degree and faced toward South for receiving maximum solar energy.
- Module Stand Model (rooftop base model) is being used here EWDS (Early Warning Dissemination System)
- Rooftop tower foundation :
- Find suitable place where no shadows from Tree or Poles.
- Clean this place and mark the base of mounting pedestal.
- Drill up to proper depth and clean the dusts.
- Put Anchor Fastener Bolt and hammer it little bit; Tighten the nuts
- Put a Square frame of height 50-100 mm.
- Mold it with grouting cement and water mix.
- Demold after 1-2 hours. Structure is ready.

Design and Simulation of Solar Tree

- Figure 2 consists of Pole mounting structure having almost 12 ft and made up of stainless steel. There were 10 numbers of head capped with photo voltaic panel (Mono/Poly), are supported by poles 0.3-0.4 ft/3.6-4.8 inch in diameter. 5 white LEDs of 10 W (1200 lm) each are situated at the bottom part of 5 of these heads and extra power can be connected to other sources.
- The base is made of reinforced concrete.
- Figure 2 shows the Ansys simulation of Pole type structure by 10 Kg load where we got directional deformation, total deformation and stress developed on the structure. The maximum directional deformation was found in x axis as 2.3622×10^{-6} mm , the maximum total deformation as 8.759×10^{-5} mm, and maximum equivalent (Von-mises) stress developed as 0.1013 MPa.
- In the Figure (3), 15 Kg load was applied on the top of the pole and total deformation was found as 4.6782×10^{-4} mm.

Solar Panels

- System Design: 12V
- Peak power of each panel: 20W

Expected Budget (INR)

- Solar Panel (20 W, Mono/Poly)- 10x1,200 = Rs.12,000
- Charge Controller (12/24V 15A) - 1x1, 200 = Rs. 1,200
- Solar Battery (12 V 80 Ah) - 1x7, 000 = Rs. 7,000
- Electrical Wires & Switches - = Rs. 500
- SS/MS Poles - = Rs. 6,000
- Civil Work - = Rs. 1,800
- Labour Charge - = Rs.

Total - Rs. 28,500

CONCLUSION

The present research describes the design and simulation of solar tree which uses a pole mounting structure and reduces space as in the flat type of structure. It will be placed near by side of the traffic area and used as lighting and also for decorative purpose during the night time. The maximum deformation and stress of pole mounting structure was found by simulation through Ansys software.

ABSTRACT

From ancient era, herbal medicine portrays one of the most important fields of traditional drugs all over the world. Medicinal plant species play a vital role to protect the life of human beings. The knowledge about curing properties has been imparted over the centuries within and between human communities. Plant kingdom produced a huge amount of biologically active and curative potentially active components. So to collect basic data many ethnobotanical surveys were attempted all over the world. Mostly plant species shows varieties of medicinal and healing properties of various diseases like bronchitis, ulcer, diarrhea, dysentery, urinary and skin disorders, etc. The species of plants is endowed with immune-modulatory, antiulcer, anticancer, antimicrobial, antitumor, antioxidant, insecticidal and herbicidal activities etc. Currently, infection caused by microbes like bacteria, virus and fungi have risen enormously and the resistance of antibiotics has become a global concern. With a hope on mind to get new drugs from the plant extracts, a special attention has been paid on this topic. To encourage the use of herbal medicine and to identify their potentiality as the sources for drugs, it is more necessary to study on indigenous plants. Like that Plant species also have natural antioxidants and produce capacity of several antioxidative components. Based on antioxidant drug formulation are used for prevention and treatment of many complex diseases. Thus in the present work reviewed the literature based on ethnobotanical studies, antimicrobial activities, antioxidant activities of plants of diversity. The study is focused on documenting the knowledge about the vegetation of the diversity and to provide future opportunities to use the flora.

Keywords: Antioxidative, Antimicrobial, Drugs, Ethnobotanical, Traditional

INTRODUCTION

Since the beginning of human civilization, medicinal plants have been used by mankind for its curative value. Nature has been a source of medicinal agents for thousands of years and magnificent numbers of contemporary drugs have been isolated from natural sources. Most of these segregations were found on the uses of the agents in traditional medicine. Jain, 1968 reported that, India has various traditional medical systems, such as Ayurveda and Unani, which has persisted through more than 300 years, mainly using plant-based drugs. The materiamedica of these systems contains a rich heritage of primordial herbal practices that helped to assist the health of many rural people of India. The ancient manuscripts like Rig Veda (4500-1600 BC) and Atharva Veda point out the utilization of various plants as medicine. The books on Ayurvedic medicine such as CharakaSamhita and SusrutaSamhita refer to use of more than 700 herbs.

UNESCO, 1996, found the application of conventional medicines and medicinal plants in many developing countries as therapeutic agents for the maintenance of good health. According to the report of UNESCO,1998 moreover, an increasing reliance on the use of medicinal plants in the industrialized societies has been detected to the extraction and development of drugs and chemotherapeutics from these plants as well as traditionally used herbal remedies. Lucy and Edgar, 1999 reported that modern pharmacopoeia still contains at least 25% drugs obtained from plants and many others which are synthetic analogues create on prototype compounds isolated from plants. Nascimento et al., 2000 characterized that such plants ought to be investigated to more readily comprehend their properties, security and strength. Kala, 2000 examined that, again in light of the fact that database on the utilization of plant species for corrective reason has been passed starting with one age then onto the next through oral custom, this information on restorative plants has started to decrease and become obsolete through the lack of ID by more youthful ages because of a move in disposition and constant financial changes.

Nautiyal et al., 2002 they considered that prompt rising interest of plant-based medications is sadly making overwhelming weight on some chose high-esteem therapeutic plant populaces in the wild due to over-collecting. A few of these therapeutic plants species have moderate development rates, low populace densities, and tight geographic extents and Jablonski, 2004 detailed that they are progressively inclined to annihilation.

Joshi et al 2004, they explored that since past decade, there has been an advanced of interest in the study of natural products are the reservoir of potential drug substance. In India approximately 85% discovery of new compounds of medicinal action is so effective from plant based sources. The three traditional medicinal systems of India, namely Ayurveda, Siddha and Homeopathy depend Homeopathy depend completely on plants for conventional formulations. World Health Organization (WHO) has calculated total international herbal drug marker as US $62 billion and is likely to rise to US$ 5 trillion around the year 2050. They also found that in India, Ayurveda alone accounts for Rs3500 cores (US$ 813 million) to the internal market annually. The worth of medicinal plants based trade in India has been calculated as Rs5000 cores per annum and is expanding yearly at the rate of 7.15. This is a manifestation of a possible raising demand for plant based drugs in near future. Approximately 90% of medicinal plants used for the formulation of conventional medicines by industries are collected together from wild in an injurious way.

Rout et al., 2005 they broadcasted from the study that 21 medicinal species in the overwood, 35 species in the middle storey, 17 species in the ground flora and 16 species of climbers, representing 38 families of families of vascular plants. Community-based conservation and management strategies can provide in solving problems related to over-exploitation and degradation of medicinal plant resources in India. Uniyal et al., 2006 they characterized that all pieces of the therapeutic plants are gathered by nearby and society networks everywhere throughout the world for their utilization however these are typically gathered in low amounts. Kala et al., 2006 additionally, he found the indigenous information on the utilization of lesser-realized therapeutic plants is likewise quickly declining. Ceaseless disintegration the in the customary information on most significant plants for medication before and the recharging interest as of late, the need existed to survey the important information with desire for building up the restorative plants division. Sandeep Pandey, 2007 analyzed on the chemical composition, ecological adaptation,

pharmacological, nutritional and ethno botanical importance of *Ocimum gratissimum* L to explore its numerous curative applications. He found that the plant is generally antimicrobial, antidiabetic, antidiarrheal, antiurilithiatic, antioxidant, antimutagenic insecticidal and anti-cancerous in nature. Okigbo et al., 2008 studied that medicinal plants are plant containing inherent active ingredients used to cure disease or relieve pain. Ncube et al., 2008 they studied that, nature has been the origin of the curative agents since ancient times. Herbal medicines have collected notable reputation worldwide due to their side effects.

Uprety et al., 2010, they were documented 56 plant species from 60 medicinal formulations, in Nepal. A 90% resemblance was reported between local plant use and found plant chemical composition and pharmacological properties for the 30 species for which data was available. Sixteen medicinal plants were ranked as priority species, 13 of which having also been prioritized in a country-wide governmental classification. Kumar and Satapathy, 2011 they recorded 72 plant species, few of which are herbs and shrubs, with some climbers, mainly belonging to class Dicotyledons. The leaves, seeds, and roots from 20, 4 and 8 plant species are used for treatments. Further the plants were observed to be highly valuable for medicinal uses including dysentery, leprosy, paralysis, piles, diarrhea etc. Anbarashan et al., 2011 conducted a survey in order to explore the medical values of scared groves in Pudukottai District, Tamilnadu. They documented a total 89species of medicinal plants belongs to 51 families. They used the medicinal plants against several diseases like throat infection, diarrhea, skin diseases, tumor, diabetes and cold, cough.

S.C. Sahu and N. K. Dhal, 2012 found that out of 57 tree species, five species were differently dispersed and 52 species were adjacently circulated. The investigation admits pervasive bunching nature of tree species in the tropical woodland of Malyagiri slope ranges. Singh et al., 2012 during the study they found that 66 therapeutic plant species having a place with 37 families and 60 genera has been archived. These plants were utilized to treat various sicknesses and aliments assembled under 11 illness classifications, with the most elevated number of species (41) being utilized for gastro-intestinal turmoil, trailed by dermatological clutters (34). Uprety et al., 2012 they introduced a survey of conventional employments of restorative plants by the Aboriginal individuals of the whole Canadian boreal woods so as to give broad documentation, perceive look into holes, and propose viewpoints for future research. An aggregate sum of 546 restorative plants taxa were utilized to treat 28 sicknesses and turmoil classifications, with the most noteworthy number of species being utilized for musculoskeletal disarranges, gastro-inside clutters. Ajibesin et al., 2012 detailed that individuals of River State, Nigeria were utilized roughly 188 restorative plant species having a place with 169 genera and 82 families to recuperate the sicknesses like dermal or stomach related issues and fever/intestinal sickness.

An ethno botanical survey of medicinal plants used in the area of Aravalli hill range was carried out by Sharma and Kumar, 2013. They have been documented 29 medicinal plant species which are used for cosmetics purpose by the tribes of this area. These plant species used by the people for curing common beauty problems like skin management and hair management. Kalaskar G M &Surana S J, 2014 they reported on 124 medicinal plant species from which 53 families were found to be used against jaundice and liver diseases by the tribal's and traditional healers. Panda et al., 2014 they reported that maximum number of sacred groves from Koraput, where only few scientific documentation of plant species in them. They documented floral diversity and uses of 94 scared plant species distributed in 63 genera be owned to 43 different families from 6 different sacred groves in a systematic manner. Panda et al., 2014 they explored the curative values of common weeds present in the crop fields, and different places like paddy field, crop field of vegetable and other localities of Koraput district (Odisha). As the result of the survey a total amount of 33 plant species belonging to 32 genera and 20 families were identified as being used for treatment of about 36 aliments including headache, toothache and eye inflammations.Patra et al., 2014 surveyed on the tribal people of Mohana region of Gajapati district, Odisha, India and the 73 plant species having medicinal properties used against asthma, breast cancer, jaundice, piles, diabetes, rheumatism, stomach disorder and skin diseases.

Satapathy, 2015 from the field examines did in Jajpur area of Odisha for recent years (1990-2010) summed up that among 1000species of blooming plants and greeneries from the region around 530 species have therapeudic esteem. Kumar and Jnanesha, 2015 learned about the restorative plants which are jeopardized requirement for earnest

security and protection. So preservation and development of uncommon and imperiled restorative harvests can be treated as an elective salary age hotspot for the rustic jobless without hampering their continuous pay creating exercises. Madharia and Jahan, 2015, they examined that in the midst of the plant decent variety not many of the plants can possibly treat numerous ailments which are alluded to as restorative plants. Hardly any chose general restorative plants utilized between the hotspot of Chhattisgarh in Traditional/Alternative remedial practice were assessed. The ethno herbal database fills in as a base for new mixes with dynamic standards for phytochemical, pharmacognostical, pharmacological and clinical research. Along these lines, upkeep of undermined plants is should be tended to direly. Kankara et al., 2015, they led an ethno plant overview to record restorative plants utilized for customary maternal social insurance in Katsina State, Nigeria, around 101 genera dispersed among 50 families were found to fix ailments like migraine, maritime torment, baby blues drain, and baby blues wound relieving had the most elevated Informant Consensus Factor (ICF) of 1.00 each. Greatest plants (68.47%) were herbs and bushes and about 84.68% of the revealed plants were wild. Leaves were for the most part utilized (32.14%) plant's part.

Pradhan et al., 2016, they currently studied betrays 91 various plant species belonging to 46 families were therapeutically used by the indigenous people. The local people mostly used these plants to heal several diseases like diarrhea, dysentery, indigestion, headache, worm infection, wound healing, stomach disorders, snake bite, Rheumatic disorder, menstrual problem etc. This will encourage a practical use of botanicals and must be continued focusing on its pharmacological validation. Xego et al., 2016 they analyzed the results show that hydroponics has the ability to develop plant growth and yield of desired plant parts even in areas where these plants do not normally grow under natural conditions. This was the case with *Siphonochilus aethiopicus.* Kumar et al., 2016 reported folk medicinal uses of approximately 26 indigenous plants among the people of villages of Manipur, which were used for aliments related to microbial diseases.

D Das and P Ghosh, 2017, they studied 30 important medicinal plant species of Southwest Bengal, India with their medicinal uses and ecological perspectives. Swagatika Patra and Pinaki Samal, 2018 they found the systematic conservation, multiplication and large scale cultivation of medicinal plants became a global concern. They analyzed of several publications and provide a widespread knowledge about the usage of plants and their parts for the treatment of several diseases in India. ShyamSundar Manna and Satyendra Prasad Mishra, 2018 they summarized that the paper, aims have been made enlist the ethno medicinal plants of Lalgrah forest range of India. The study broadcasts that 52 different plants species are used by native people to heal different diseases. Out of the 52 plant species, 17 are herbs, 20 tress 11 shrubs, and 4 are climbers. The list of plant parts, habit, mode of their use and purpose has been documented in this study.

Kumar S et al., 2018 they highlighted the use of local flora, explore, identification, ethno botany and conservation of wild and cultivated plant species in the city of Rourkela, Odisha, India. A total of 154 plant species, be owned by 128 genera and 55 families, were identified. The documentation of all useful floras with ethno medicinal potential is helpful in conserving plant biodiversity as well as in environmental surveys along with potential applications in drug discovery and oriental medicine. Axiotis et al., 2018 gave an account about the therapeutic purposes and galenic preparation by local medical doctors and pharmacists of the area of Greek islands of the North Aegean Region. They found that about 109 wild plants from 52 families, which are being used for the curative purposes. In semi-pastoral Gujjar tribe in the high altitude of Chamba, of Western Himalaya an ethno botanical survey on medicinal plants were carried out by Rana et al., 2019. They have been documented 83 plants belonging to 75 genera and 49 families that were observed to have ethno medicinal uses followed by food, household uses, fruits, and fodder.

Antimicrobial activity

From 2000 years antimicrobial use has been common in people. Ancient Egyptians and ancient Greeks used specific molds and plant extracts to heal infection. Antimicrobial activity refers to the process of killing or inhibiting the disease causing microbes or to stop their growth. Different antimicrobial agents are used for this purpose. On the basis of microorganisms antimicrobial medicines can be categorized. It may be antibacterial, antifungal and antiviral.

For example, antibiotics are used against bacteria, antifungal are used against fungi and antiviral are used against virus. They all have different modes of action by which they act to suppress the infection. Rios and Recio, 2005 recorded the detailed data of such as history of uses of medicinal plant, future aspects of medicinal plants and the current status of medicinal plants on the basis of potential antimicrobial properties and also as a source for natural compounds that act as new anti-infection agents. They documented the number of published articles based on the antimicrobial activity of medicinal plants in PubMed. During the duration between 1966 and 1994, they found about 115 articles, after then from 1995 to 2004 they found 307 articles.

Dabur et al., 2007 worked with 77 extracts from 24 plants having antimicrobial properties was screened against 8 bacteria and 4 pathogenic fungi, using microbroth dilution assay. The objective of the study was to assess the antimicrobial activity of some medicinal plant used in Ayurveda and traditional medicinal system for treatment of manifestations caused by microorganisms. As result they found that antimicrobial activity of plant extract was considered to be good if its MIC was less than 100.0 µg/ml, moderate if MIC was from 100.0 to 500.0 µg/ml and poor over 500.0 µg/ml.

NCC and Junior A, 2010 carried out a scientific survey on biological characteristics of medicinal plant species and their pathogenic microorganisms resistant to antimicrobials. At the time of secondary vegetal metabolism produced active compounds which are responsible for the biological properties of certain plants used to cure various diseases like infectious diseases all over in the world. Shihabudeen et al., 2010 surveyed and gave a report on the presence of coumarins, flavanoids, glycosides, phenols, tannins, saponins and steroids. In this survey, methanol extracts of six plants, which had been explained in herbal books and folk medicine of India, were screened for their antimicrobial activity against certain pathogenic bacteria and fungi that can cause gastroenteritis, urinary tract infections, pneumonia, urinary tract, burns and wounds, lung infection and toxic shock syndrome.

Selvamohan et al., 2012 studied those seven medicinal plants (*Aloe vera, Phyllanthus emblica, Phyllanthus niruri, Cynodon dactylon, Murryakoenigii, Lawsonia inermis, Adha-thoda vasica*) which were collected from Nagercoli, Tamilnadu, India. Those have been used for therapeutic treatments which were estimated for activity against pathogenic bacteria such as *Staphylococcus sp., Escherichia coli, Klebsiella sp., Pseudomonas sp*. The invitro antimicrobial activity was performed by agar well diffusion method and disc diffusion method. The ethanolic and aqueous extracts showedminimum antimicrobial activity when compared to methanolic extracts. The methanolic extract *Phyllanthus niruri* (stone breaker) showed the maximum activity against *Staphylococcus sp.*

Alavijeh et al., 2012 described that most plant extracts produced antibacterial and antifungal properties. The present survey was instigated because of the increasing resistance to antibiotics including bacteria and fungi. Plant extracts and compounds are of new interest as antiseptics and antimicrobial agents. As result extracts of *Azadiracta indica* and *A. nilotica* recorded to control higher antimicrobial activity among the other tested medicinal herbs.

Narware et al., 2014 gave a review on the current study of antimicrobial activity and phytochemical effect of the plant *Gardenia gummifera* Linn (Rubiaceae) which is commomly known as Dikamali against some microbes like *S. aureus* and *E.coli*. Dikamli has gum pitch exudates from the leaf buds of these trees. Dikamali has various therapeutic properties which incorporate antispasmodic, carminative, anthelmintic, diaphoretic and expectorant. It is likewise professed to be helpful in dyspepsia, tooting for cleaning ulcers and wounds and to keep off flies from wounds in veterinary practice. Sree et al., 2014 gave a detailed account on the study to analysis medicinal potential of five mostly used plants such as *Naravelia zeylanica* DC., *Adhathoda zeylanica* Medic, *Cassia auriculata* L., *Vitex negundo* L., *Orthosiphon staminus*, of Western Ghats of India. Many of the extracts performed activity against pathogenic bacteria and fungi. The objective of the study was to actuate the content of total phenolics and total flavonoids and to evaluate total antioxidant activity, free radical scavenging activity, and to determine the antimicrobial activity of five Indian medicinal plants of Western Ghats. The overall antioxidant activity of *Narvelia zeylanica* and *Adathoda zeylancia* were found to be the strongest.

Farjana et al., 2014 studied that the antimicrobial activity of extracts of guava, green tea, neem and marigold against various species of bacteria. By agar well diffusion method they examined the antibacterial activity of plant extracts.

They concluded that the leaves of guava, green tea, neem and marigold show antibacterial activity against different pathogenic bacteria species. They could be used as alternatives to common antimicrobial agents for treatment of bacterial infections. Leaves and bark of the guava plant are distinguished for the cure of diarrhoea, colds, toothaches and swelling. Green tea is used for the treatment of lung, pancreas, liver, skin cancers etc. Neem leaves are used to control hepatitis, and diabetes, and marigold leaf is knows to be highly effective because of its therapeutic use against burns and bruises.

Javid et al., 2015 carried out a experimental survey to recognize the in-vitro efficacy of three medicinal plants such as *Artemisia indica*, *Medicago falcata* and *Tecoma stans* in Pakistan against selected bacterial and fungal strains. They concluded that those plants have traditional uses and also have antimicrobial properties. Antimicrobial activities may be due to strong occurrence of active compounds i.e. saponins, tannins, alkaloids, steroids, phenols and flavonoids. Packer et al., 2015 organized an ethno botanical survey with Yaegl Aboriginal community of northern New South Wales, Australia. They surveyed that the antimicrobial prpperties of plants used to cure the wounds, sores and skin infections. Aqueous or 80% aqueous ethanolic extracts from nine selected plants such as *Alocasia brisbanensis*, *Canavalia rosea*, etc. were tested against the Gram positive and Gram negative antibiotic sensitive bacteria. They concluded that Aqueous and 80% aqueous ethanolic extracts of *Lophostemon suaveolens*, *Corymbia intermedia* and *Syncarpia glomulifera* exhibited promising levels of antimicrobial activity against a range of both antibiotic sensitive and resistant strains of microorganisms This study showed the value of customary knowledge in the identification of new sources of antimicrobial treatments.

Sailaja V. et al., 2016 carried out a research on seed of six plants having medicinal properties such as *(Acacia catechu, Sida cordifolia, Momordica fotida, Albiziz procera, Mesua ferrea and Lantana camare)* for the experiment on antimicrobial activity by using 4 types of solvet like water, Acetone, Petroleum Ether and chloroform. Plants seed extracts showed highest zones of inhibition on gram positive bacteria than gram negative species. They concluded that this study may help in the future study and discover many more novel curative agents from plants. Lakshmi Sundaram, 2016 explored that the antimicrobial potential of *Messua ferrea* examined for their antibacterial effect on certain selected strains of bacteria by using the standard method of diffusion disc plates on agar and MIC was estimated using dilution method. Final result showed the antimicrobial properties of the selected plant. Erecevit and kirbag, 2017 conducted a survey to explore the antimicrobial activities of some medicinal plants. They took extracts of eight species which have therapeutic properties such as *Rhus coriaria* L., *Pistacia terebinthus* L., etc. screened against pathogenic microbes. They concluded that the extracts of *R.coriaria, P.terebinthus* subsp. *Palestina, U. erectus* and *C. virgata* reported antimicrobial activities against to bacteria, yeasts and dermatophyta. Also there was no effect of the extracts on some microbes.

Egamberdieva et al., 2017 reported that to isolate and characterize enodohytic bacteria from two medicinal plants, *H. perforatum* and *Z. capitata*, with contrasting antimicrobial activities from Chatkal Biosphere Reserve of Uzbekistan and evaluate their plant-specific traits involved in bio-control and plant growth promotion. The antagonistic isolates were able to control tomato root rot caused by *Fusarium oxysporum* and stimulated plant growth under greenhouse conditions and could thus be a cost-effective source for agro-based biological control agents. At the end indicate that further research is necessary to resolve the impact of medicinal plant species with contrasting antimicrobial activity on the endophytic microbial community in more detail, and to identify biological active compounds produced by the hosts and their endophytes.Romulo et al., 2018 surveyed that a total of 49ethanol extracts from 37 various medicinal plant species of Indonesia, belonging to 23 different families were screened for their in vitro antimicrobial activity. They concluded that leaf extract of O. aristatus and W. floribunda displayed significant anti-candidal effects. Therefore, both of these plants could serve as source materials for the development of new anti-candidal agents. However, future phytochemical research based on these species will be needed to isolate and characterize their antimicrobial effective constituents. Tlili et al., 2019 worked on seven aromatic plants which were used traditionally in the Tunisian region in folk medicine. They focused on the biochemical and biological characteristics of the taken plants. After the test all the plants sighted a phenomenal existence of secondary metabolites. R. tripartite and Z. lotus

were occurred to be especially effective in anti-proliferative activity, while *H. fontanesii* were presented to have the best anti-inflammatory activity.

Antibacterial activity

Anything that kills bacteria or muffles their growth or their capacity to reproduce is known as antibacterial activity. Heat, chemicals like chlorine, and antibiotic drugs all have antibacterial properties.Nascimento et al., 2000 reported that the antimicrobial activity of certain plants which extracts were used for the test such as *Achillea millifolium* (yarrow), *Caryophyllus aromaticus* (clove), *Syzgyum joabolanum* etc. They found the highest antimicrobial potential showed for the extracts of *Caryophyllus aromaticus* and *Syzgyum joabolanum*, which inhibited 64.2 and 57.1% of the tested microorganisms, respectively, with higher activity against antibiotic-resistant bacteria (83%). Association of antibiotics and plant extracts showed antibacterial activity against antibiotic-resistant bacteria. The results obtained with *Pseudomonas aeruginosa* was particularly interesting, since it was inhibited by clove, jambolan, pomegranate and thyme extracts. This inhibition was observed with the individual extracts and when they were used in lower concentrations with ineffective antibiotics.

Ushimaru et al., 2007 studied the antimicrobial activity of methanolic extracts of some medicinal plants against *Escherichia coli*, *Salmonella typhimurium*, *Staphylococcus aureus* and *Enterococcus* sp. They concluded that the methanolic extract of *Caryophyllus aromaticus* obtained the highest anti-*S.aureus* activity and was valuable against all bacterial strains screened.Khan et al., 2013 found a report from the current survey that the antimicrobial activity of three plants *Bergenia ciliate*, *Jasminum officinale*, and *Santalum album* screened against human pathogenic bacteria like *Escherichia coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Bacillus subtilis* and *Proteus vulgaris* by using agar well diffusion method. Amid the three extracts of plants *B. ciliate* displayed the highest activity against *B. subtilis*. Roger et al., 2015 the current study was undertaken to investigate traditional process of healing typhoid in Bamboutos division. They preferred 38 plants species for screening the antimicrobial properties. All the extracts of plant species displayed activity against pathogenic bacteria like *S. typhi*, *S. paratyphi* A and *S. paratyphi* B. The final outcome was maximum plants sample used for the treatment of typhoid as anti-typhoid drugs.

Stankovic et al., 2016 reported the antibacterial activities and antioxidant capacity of eight aromatic plants, which are used as drugs in the region of the Balkan Peninsula. They took the plants such as *Hyssopus officinalis*, *Angelica pancicii*, *Tanacetum parthenium* etc, against 16 pathogenic bacteria like *E. coli, P. aeruginosa, S. pyogenes* etc. They concluded that *A.crithmifolia, A. grandiflia and A. absinthium* had maximum antioxidant characteristics while *A. sylvestrys, L. latifolium* showed the minimum probable. A phytopharmacological survey by Surrbar et al., 2017 revealed that *Ricinus communis* leaves extracts are used to cure candidiasis, skin and wound infections in Ghana. They found that aqueous, methanol and ethanol extracts were exposed to have most of the phytochemicals analyzed. As result methanol extract displayed highest antimicrobial activity and petroleum ether showed lowest antimicrobial activity. Also this survey will help in further study on antibacterial and antifungal activity of the plant.

Masoko, 2017 evaluated from the survey that *Spilanthes mauritiana* crude extracts tested against pathogenic bacteria for biological activity. They concluded that current study displayed the presence of compounds in S. mauritiana against tested pathogenic bacteria. Bereksi et al., 2018 took a survey and investigated that the antibacterial activity of extracts of certain plants like *Cassia angustifolia, Cistus monspeliensis* and *Nigella sativa* screened against various types of gram strains bacteria. Result of this study signified that the antibacterial activity supports their use to heal the infectious bacteria.

Antifungal Activity

Demolishing fungi or reducing their growth rate is known as antifungal activity. Saha D et al., 2005 reported that ethanol and aqueous extracts of 30 plants from sub- Himalaya West Bengal (India) used for controlling four foremost foliar fungal diseases of tea were screened against the pathogenic microbes. Among all the samples, extracts of *Allium sativum* L., *Datura metel* L., *A. joss*, and *Curcuma longa* L. documented 100% inhibition of spore germination. As result the antifungal compound from those plants may be used in controlling the fungicides for tea.

Dellavalle et al., 2010 surveyed and provide the details on the antifungal properties of extracts of 10 plant species used in conventional Uruguayan medicine against the phytopathogenic fungus Alternaria spp. In the midst of 29 evaluated extracts, 31% of the extracts reduced the growth and also three solvents were examined on different tissues of the plants. Acid extracts of the plants were more valuable than the aqueous or buffer extracts against Alternaria spp. equivalent to principles acquired with the traditional fungicide captan. The extracts of *Salvia sclarea, S. officinalis* and *R. officinalis* could be regarded as potential sources of antifungal compounds for healing diseases in plants. These extracts displayed highest activity, still at very least concentrations, and the equal fungicide effects as chemical fungicide. They finish with the conclusion was that extracts of plant samples reveal incredible fungicidal characteristics that maintain their conventional use as antiseptics.

Ambikapathy et al., 2011 observed the antifungal activity of five special medicinal plants extracts such *as Lawsonia inermis* L., *Mimosa pudica* L., *Tephrosia purpurea* , and *Vinca rosea* L. were screened against pathogenic fungi like *Pythium debaryanum* by using the method of agar well diffusion. Among the three solvents like n-butanol, methanol and aqueous, the methanoloc extracts of *L. inermis* displayed highest amount of antifungal properties against *P. debaryanum*. Masih et al., 2014 regarding the enormous prospectively of plant as sources for antimicrobial drugs with reference to antibacterial and antifungal agents, a systematic investigation was carry out to test the local flora for antifungal activity from the leaves extract of *Pongamia pinnata*, *Calotropis procera*, *Nerium indicum* and *Curcuma longa* were taken in aqueous solution, screened against pathogenic microbes- *Aspergillus fumigatus*, *Alternaria solani*, *Helminthosporium* spp. and *Fusarium solani*. As final result they found that aqueous extracts of *Calotropis procera* leave was a good source of antimicrobial components and also the latex of plants had a property of spectrum antifungal activity and plants used in the treatment of infectious diseases.

Silva et al., 2014 observed that to identify the competence of aqueous extracts from medicinal plants against the pathogenic organisms of coffee tree. Extracts of plants from different parts like bulbs of *A. sativum*, flower buds of *S. aromaticum*, leaves of *V. polysphaera*, *Azadirachta indica, Ricinus communis* and *Cymbopogon citratus* screened against pathogenic fungus such as *Cercospora coffeicola, Fusarium oxysporum, Phoma tarda* and *Hemileia vastatrix*. Experiments carried out in vitro conditions based on mycelia growth and conidial germination inhibition. The mainly valuable plan extracts against the micellial growth and conidial germination were *V. polysphaera*, *S. aromaticum* and *A. sativum*. Abkhoo and Jahani, 2016 surveyed and noticed that the antifungal activity of the medicinal plant species, collected from Sistan region, Iran like *Peganum harmala, Glycyrrhiza glabra, Mentha spicata* and *Rosmarinus officinalis* which were used as conventional medicine tested against pathogenic microbes like *F. oxysporum*. It showed the result that out of total herbal extracts four displayed fungistatic activities and two presented fungicidal activities. At final stage of research they found antiungal activities of herbal medicines against *F. oxyspoum*. Especially extracts of *G. glabra* showed bioactive components effectual to reduce the growth of *F. oxysporum.*

Salhi et al., 2017 documented the detailed that the antifungal properties of aqueous extracts from native plants such as Artemisia *Herba alba, Cotula cinerea, Asphodelus tenuifolius* and *Euphorbia guyoniana* that grow instinctively in the Northern Sahara of Algeria screened against two fungal species of *Fusarium* genus in in-vitro assay. The final result attained that the antifungal activities of *C. cinerea*, *A. tenuifolius*, and *E. guyoniana* used for manage the fungi affecting wheat yield safely. Also it evaluated the use of extracts as Integrated Pest Management. Santos and Pereira, 2018 enlisted 38 plants of Candida species having medicinal properties were used by the Brazilian people for conventional purpose against pathogenic micro organisms. Survey had also disclosed that the plants examined were not toxic at curative doses with good antimicrobial properties. They concluded plant extracts used to produce developed phytomedicine to heal oral candidiasis for multi resistant Candida albicans.

Antioxidant Activity

Antioxidant activity is described as a confinement of the oxidation of proteins, lipids, DNA or different particles that happens by obstructing the spread stage in oxidative chain responses and essential cancer prevention agents legitimately rummage free radicals, while auxiliary cancer prevention agents by implication forestall the arrangement of free radicals through Fenton's response. Cell reinforcements movement is an uncommon case of a

useful preferred position that plant concentrates can convey. Plants are recognized to have a scope of normal cancer prevention agents that shield and save their physical and metabolic trustworthiness just as their heredity by method of their seeds. The vast majority of these concentrates and parts from plants are ascending as contender for sensible the impacts of the maturing procedure on skin by constraining biochemical results of oxidation. In other word cell reinforcement is a substance that decrease harm as a result of oxygen, for example, that brought about by free radicals. It might assume an imperative job in coronary illness, malignant growth and different infections. Cancer prevention agents, similar to Vitamin and E and carotenoids may help protect cells from harm brought about by free radicals. Other normally happening cancer prevention agents incorporate flavonoids, tannins, phenols and lignans. Plant based nourishments are the best sources. These incorporate organic products, vegetables, entire grains, nuts, seeds, herbs and flavors.

Gacche and Dhole , 2006 took a survey to investigate that 50% alchol extracts of different parts of some selected plant species such as *Swertia chirayita, Cedrus deodar, Pongamia glabra* etc. were tested for antioxidant and anti-inflammatory potential. Selected plants under the survey were showed to be efficient scavengers of DPPH radicals. Finally they concluded that it will help in the further study and use for standardization and validation of traditional medicines containing active components.Harnafi and Amrani , 2008 enlisted all the data from the reviews that the foremost important colorimetric techniques used to find out polyphenol content in extracts of medicinal plant species and the spectro photometric assays utilized to assess their antioxidant power.

Mosquera et al., 2009 reported for the first time on the antioxidant activity of Colombian species. They surveyed the antioxidant properties of methanol extracts of forty-six plants, belongs to the families Asteraceae, Euphorbiaceae, Melastomataceae, Rubiaceae and Solanaceae, collected from Regional Natural Park, Colombia. Among all the extracts *Phyllanthus sp., Tibouchina grossa, Miconia lehmannii* and *Lycianthes radiate* were displayed the maximum antioxidant activity 54%, 47%, 45.3% and 41.5% respectively.

Jaber et al., 2011 described plant extracts and their compounds present in foods and medicinal plants as a natural source of antioxidants have been comprehensively analyzed. Objective of the survey was to find valuable antioxidants for the cure purpose or control of free radical- mediated deleterious effects. Krishnaiah et al., 2011 studied that natural antioxidants stand for a prospective side effect- free substitute to synthetic antioxidants in the food processing industry and for use in defensive medicine. The aim of the study was to record medicinally magnificent plant species from around the world and displayed that many have high antioxidant activity when compared to synthetic antioxidants. Ho et al., 2012 noticed form the study was to test the probable antioxidant activities of the methanol and water extracts of 31 medicinal plants in Taiwan. They found that *Rotala rotundifolia*, *Juncus effusus* var. *decipiens*, *Cyperus iria*, *Salix warburgii*, *Lindernia antipoda*, *Kyllinga brevifolia*, and *Typha orientalis* acquired both high antioxidant activities and high amount polyphenol contents. From the results established that antioxidant activities were not directly related to polyphenol quantity. So, phytochemicals will play a vital role in the potent antioxidant activity of wetland medicinal species.

Chirag et al., 2013 presented a special note on the variety and vast potential applications of antioxidant or free radical manipulations in control and cure of diseases. Natural products from dietary compounds like Indian species and medicinal plants are known to acquire antioxidant activity. Objective of the study was to display the antioxidant/ antiradicals and their function in human body and also their presence in spices and herbs. In amplifying intake of dietary antioxidants may help to sustain an adequate antioxidant status. To defend the cells and organ systems of the body against reactive oxygen species, humans have progressed a highly sophisticated and complex antioxidant protection system. Rayasandra et al., 2013 evaluated of antioxidant properties of extracts of various type of medicinal plants and their association with the total phenolic contents (TPCs). They tested 35 medicinal plants from which four plants were chose for the experiment. The methanol extracts of *Acacia catechu* (AC-ME), *Adenanthera pavonia* (AP-ME), *Holopetelea integrifolia* (HI- MI) and ethanol extacts of *Terminalia paniculata* (TP-EE) displayed maximum antioxidant activity with 50% inhibitory concentration. In the end plants could serve as a natural source of antioxidants in the food industry and with their other pharmacological properties.

Proestos et al., 2013 surveyed on the characterization and qualification of the phenolic fraction of some selected aromatic plant extracts and essential olis collected from Greece, their antioxidant activity evaluation, and estimation of essential oils by specific assays. As result the methanolic solutions of the essential oils displayed maximum antioxidant properties. Thus it concluded that the screened aromatic plants contain some specific quantities of polyphenols and flavonoids, which are perfect sources of antioxidants.

CONCLUSION

The above review showed therapeutically properties of plant species all over the world and displayed that many have high antimicrobial activity and antioxidant activity. Most of the drugs used in the area are prepared from fresh plants collected the wild. The plant parts such as bark, flowers, rhizomes, roots, leaves, seeds, gum and sometimes whole plant were used for the medicinal purpose. Among them many of the plant species have high phenolic content and a large quantity of flavonoids, tannins, lignin and flavonols. Special attentions on plants have different families from around the world to understand and to record the curative uses and antioxidant activities. The new findings and the detailed knowledge these medicinal plants possess antioxidant and curative properties entails that making these plants as an integral part of daily consumption may control several diseases. Several types of studied on the mechanism of action, interactions with other medicinal plants or components, and the extracts should be given high attention. Current survey found that the antibacterial activity vary with the species of plant and parts of plant. So it proved that antibacterial activity could be the potential source for the discovery of new herbal medicine. Recently the World Health Organization (2002) promotes and recommends herbal medicines in national health care programs. So, medicinal plants improve the socio economic situations as well as lives of tribal. The curative uses of plants used for healing several diseases include cold, cough, jaundice, diabetic, skin diseases and cancer etc.

ABSTRACT

The aim of this research is to develop a solar dish type cooker for domestic cooking purpose in rural area where there is no access of electricity and to ensure the sustainable development through clean energy. Many researchers had developed the solar dish type of cooker where the material like Aluminium was taken as glazing or polishing surface as reflector. But in this research there were number of Chromium vinyl material strips were attached on the dish which acts as reflector in order to increase the reflectivity and to enhance the efficiency. The cooking power and Energy generated for the steam was calculated as 835 W and 0.977 KW.The maximum temperatures was measured in a sunny day as 136^{0}C which is sufficient enough to cook food and for generating steam.

Keywords : Solar dish, Concentrator, Chromium vinyl, reflectivity

INTRODUCTION

Due to the maximum energy consumption in India the world energy demand is expected to rise more than 25% in next 20 years. It has been observed that industrial sector accounts more than 50% of the world energy consumption followed by transportation and building sector. Energy consumption is different for rural and urban area. Maximum energy is consumed in rural area as domestic purpose like cooking and lightning purpose. Generally the resources like cow dung, fire wood, agricultural residue are used as fuel for cooking purpose which results environment pollution and health issue.So solar operated cooking device is the alternative source for solving the problems.

M. Kumar et al [1] had done the performance testing of parabolic dish type solar cooking device .By taking the specific aperture area and focal length he had done the experiment by using different types of materials for cooking vessel. K. Schwarzer et al [2] designed an analytical method for designing simple cooking system.V.Kumar et al. [3] developed a portable dish solar cooking device which is used for frying purpose. He had designed a prototype and performance was formulated with SK 14.I.L Mohammed [4] had designed a parabolic type of dish collector by taking aperture diameter as 1.8m and focal length as 69.8 cm.The cooker was capable of cooking 30Kg of rice with in 90 to

100 minutes. S.Das. et al [5] had done the thermal analysis of parabolic type of dish cooker in which he got the thermal efficiency as 54% and at a steam rate of 0.91 kW.

Experimental set up

The main components of the solar dish type of collectors are dish type of reflector and receiver. There are number of segment of chrome vinyl material are attached in the surface of dish and act as reflector. The receiver was placed at a focal length and placed perpendicular to the centre of the dish. The dish was placed on the structure in such a way that it will be manually operated as per the direction of the sun's position. The receiver was painted as black in order to absorb maximum solar radiation. This dish having 2 m aperture diameter, 0.5 m depth and 0.3 m focal length was designed, constructed and fabricated. The receiver was made up of aluminium container and entire surface of the dish is stainless material. As the sun radiation incident on the reflecting surface of the dish, it will concentrate all the radiation into the receiver which was placed at focal distance. It will absorb the heat and gets food cooked.

Mathematical modelling

The focal distance was calculated as $f=d^2/16h$ equation 1

$$\tan\varphi = \frac{1}{\frac{d}{8h}-2h/d}$$ equation 2

Where, f=focal length, d=diameter of aperture, h=depth of parabola □= rim angle.

RESULT AND DISCUSSION

The solar cooker was put in an open atmosphere and where there was no shadow effect. With a regular interval of time the temperature reading was taken with the help of Temperature sensor and Solar irradiation was measured with the help of Lux meter. The maximum temperature reached up to 136^0C which is sufficient enough to cook the foods and also boil the water in the table 1.The amount water taken as 2 litres for testing purpose. Throughout the day a manual operated tracking device was used to rotate the dish as per the direction sun's position.

The cooking power was calculated as 835W by taking maximum interval temperature as 136^0 C and 130^0C. C_{water} =4.2J/g^0C or 4179.6J/KgK.

It has been observed that the maximum amount of water evaporated in 30 minutes is 0.65 Kg.The mass flow rate computed as 3.611×10^{-4}Kg/s. By taking latent heat of vaporisation=h_v=2706 kJ/Kg, the total energy of the steam per unit mass= $3.611\times10^{-4}\times$ 2706=0.977 KW

CONCLUSION

The present research describes about the performance testing of dish type of solar cooker. The cooking power and total energy of the steam was calculated. The amount of heat produced by the cooker was sufficient enough to cook foods. There was some heat lost to the atmosphere and again when the intensity of solar radiation decreases, there was no possibility of cook the food. Further scope of research is to reduce the heat loss and increase the cooking power.

ABSTRACT

This paper presents a design of meander line broadband small antenna which is proposed for Wi-Fi applications. This antenna consists of a substrate called FR4 having relative dielectric constant 4.4, then a microstrip feedline on the ground plane and a meander line on the patch. It is designed to operate at 2.4 GHz and its whole size is 8.5 mm×8.5 mm×1.524mm. This is one of the smallest antennas available at this frequency. In this design, we used a single layer substrate ad easily simulated by high frequency structure simulator (HFSS). The simulated S_{11} plot shows that return loss is than -10 dB. The simulated radiation pattern and 3D polar gain show a positive gain which satisfies the good condition of an antenna design. The antenna performance is studied numerically. It can be a good candidate for future compact wireless devices that require a compact and simple antenna structure with a good performance.

Keywords- Meander line, return loss, radiation pattern, electrically small antenna, broadband antenna.

INTRODUCTION

Impedance band width of 50 MHz at 2.4 GHz. The various electrically small antenna is proposed in [1]. The best design has been used metallic curved strips to get better performances. The simulated results showed a 10dB impedance bandwidth of 22.4 MHz. A compact CPW-fed zeroth-order resonant antennas (Dimensions: 0.201 $\lambda 0$ × 0.17 $\lambda 0$) have been presented in [2]. By adding chip inductors to the antenna, impedance bandwidth has increased to 210 MHz. A wideband and compact antenna (Dimensions: 0.55 $\lambda 0$ × 0.55 $\lambda 0$) is proposed in [3]. The antenna consists of two arms with eight via that resonate at 3.3 GHz and had a -10dB impedance bandwidth of 220 MHz. A compact planar monopole backed antenna with a 2 × 1 array of electromagnetic bandgap structures (Dimensions: 0.31 $\lambda 0$ × 0.55 $\lambda 0$) for wearable applications has been proposed in [4]. The simulated results showed a -10dB impedance bandwidth of 120 MHz. An electrically small dipole antenna using a non-periodic left-handed transmission-line structure is presented in [5]. The 4.8% bandwidth can be obtained through optimizing the values of the series capacitors and shunt inductors. A single-layer Inductively coupled capacitively loaded monopole antenna with small ground plane for 2.362 GHz is reported in [6]. The simulated -10 dB impedance bandwidth is 0.36%. A CPW fed chip

inductor loaded electrically small antenna for WLAN frequency is proposed in [7]. To achieve a compact size and a bandwidth of 40 MHz, an open-ended coplanar transmission line has been loaded with a chip inductor. An electrically small antenna is constructed by using multiple coupled split-ring resonators (SRRs) in [8]. The proposed antenna had six layers and a relative bandwidth of less than 0.3%. In [9], it is shown how to design a compact antenna with a tuning inductor and an inductively coupled feed system. The measured results showed a -6 dB bandwidth of about 110 MHz at 2.42 GHz. One of the ways to increase the gain of electrically small antennas is to increase the area of the antenna, which is improved in [10] by antenna array. By increasing the antenna area through the array, they have been able to increase the gain from -15.4 dB to -5.5 dB.

Meanderline antenna

The design of meander line antenna is a set of horizontal and vertical lines. Combination of horizontal and vertical lines forms turns. Number of turns increase efficiency increases in case of meander line if meander spacing is increase, resonant frequency decreases. At the same meander separation increases resonant frequency decreases. A meander antenna is an extension of the basic folded antenna and frequencies much lower than resonances of a single element antenna of the equal length. Radiation efficiency of meander line antenna is good as compare to conventional half and quarter wavelength antennas. Antenna size reduction factor α depends primarily on the number of meander elements per wavelength and spacing of the element widths of the rectangular loops. The meander line element consists of vertical and horizontal line so it formed a series of sets of right angle bends. The polarization of antenna depends on radiations from the bend, the spacing between two bends is very vital, where if the bends are too close to each other, then cross coupling will be more, which affects the polarization purity of the resultant radiation pattern. In other case the spacing is limited due to the available array grid space and also the polarization of the radiated field will vary with the spacing between the bends, and the spacing between the microstrip lines. Planar meander line antenna with added quarter parasitic element at both side of the meander can produce double radiation pattern at frequencies much lower than resonances of a single element antenna of equal length. A planar line monopole antenna element is the most suitable choice for MIMO antenna system. The tool which we have used to design the antenna was HFSS. The designed antenna has been fabricated on the FR4 substrate. Network analyser has been used to test the fabricated design. MLA antennas for RFID based on multi objective optimization. The purpose of this design is to made effective meander line antenna for RFID purpose. The multi-objective system is faster to converge than the single goal one. However, considering that SWRs of 1 and 40 at pattern frequencies can be considered Pareto most useful for the former method, the solution of the worst-case components may be appeared more meaningful, that is, an excellent decision rule, even though it is either ruled or protected in the optimal Pareto set. In our case, for the purpose of reducing the size of transponder, a meander-line antenna (MLA) is an attractive choice. This class of antennas provides the largest size reduction at a given frequency at the expense of a narrow bandwidth. Compared with the PIFA antenna, there is an advantage that the MLA is relatively easy to catch larger relative bandwidth. A meander-line antenna can be realized by bending the conventional linear monopole antenna to decrease the size of antenna. The influence of the meander part of the antenna is similar to a load and the meander line sections are considered as shorted-terminated transmission lines. The meander line section can be modeled as an equivalent inductor. In the far-field pattern, in the result of the cancellation of magnetical fields, the transmission lines of a meander line antenna do not radiate fields. The radiation fields will be radiated from the vertical pars of MLA. It is a smaller area, but the radiation resistance, efficiency and bandwidth decease. In order to find the best antenna solution, different values of meander width are simulated and studied.

Modal study of proposed electrically small antenna

The proposed antenna consists of a microstrip-feed-line of length L_f and width W_f on the top surface of the substrate and a meander-line connected to the ground plane on the bottom of the substrate. First, the modal analysis of the microstrip-feedline and meander structure has been studied, separately. Then the modal analysis of the entire

structure of the antenna has been studied. The commercial software package HFSS [11] has been used for the modal study.

1. In Modal analysis of the microstrip-feed-line the first two characteristic angles of the microstrip-line. It can be seen that the characteristic angle of the first two modes are near 270□ and store electric energy. Thus, none of the modes of the microstrip-line are within the range of 1 to 4 GHz resonant.
2. Modal analysis of the meander structure: Fig1 shows the first two characteristic angles of the meanderline attached to the ground plane. It can be observed that only the first mode is resonant and its characteristic angle crosses 180□ at the frequency of 2.91 GHz.

3) Modal analysis of the proposed antenna: Characteristic angles of the entire antenna structure are shown in Fig.2. It can be seen that the first mode resonates at the frequency of 2.52 GHz since its eigenangle crosses 180□. Fig. 3 shows the first eigencurrent of the proposed antenna. The first eigencurrents on the meander structure in this stage and the previous stage have the same profile and flows from one side to the end of meander-line. But in the microstrip-line associated with the meander structure, the flow path of the first characteristic current is longer than the alone microstrip-line, and it is not a straight line. When this parasitic structure is located in very close ($\lambda_0/85$) to the microstrip-feed-line, extending theflow path increases bandwidth. Due to the coupling between the meander structure and microstrip-feedline, the resonant frequency has been shifted about 390 MHz [12]. In the simulation, the proposed antenna is analyzed with a finite substrate and volume equivalence principle (VEP).

Design and implementation

For designing the proposed electrically small antenna, five steps are considered. In step 1, the antenna shape includes a microstrip-feed-line on the top surface of the substrate and a conventional ground plane on the bottom of the substrate. In step 2, a square slot is created on the ground plane. In step 3, a straight line is connected to the ground plane. In step 4, two gaps of length L1 are created on the square ring. Finally, the straight line is replaced by a meander-line. In [13] and [14], due to the presence of the microstrip-feed-line and the meander-line on the top surface of the substrate, the overall size of the antenna has become larger. In step 5, it can be seen that the meander-line acts as the principle radiation component of the antenna structure because there are strong currents on the meander-line.

Parametric study

To study the results of various parameters on the overall performance of the proposed antenna, a parametric study has been performed. The antenna has been simulated through using High Frequency Simulated Software (HFSS). In the proposed antenna, the meander structure is located in very close proximity to the microstrip-feed-line, approximately $\lambda_0/85$, and it provides a large inductance to achieve the desired impedance matching. The microstrip-feed-line width influences the imaginary part of the impedance. Increasing the length of M_1 or decreasing M_2 of the meander-line as shown, provides a larger inductance. Fig. 5 shows the reflection coefficient and gain of the proposed antenna for distinct values of the meander length (M_1), meander width (M_2), space between two strips (M_3), gaps length (L_1), feed length (L_f) and feed width (W_f) From Fig.5(a), it can be seen by increasing M1, the resonant frequency is decreased. Moreover, the increase in M2 or the decrease in M3 increases the resonant frequency as shown in Fig. 5(b) and (c). In general, by reducing the coupling between the microstrip-feed-line and meander structure, the resonance behavior shifts towards lower frequencies. From Fig. 5(d), it can be seen by increasing L1, resonant frequency is increased. As can be seen in Fig. 5(e) and (f), the length and width of the feed-line only cause the frequency shift. As can be seen in Fig. 12, varying the parameters causes a slight change in the gain curve. However, due to the resonant frequency shift, there is little change in the gain value.

RESULTS AND DISCUSSION

To validate the design process of the proposed electrically small antenna, it has been fabricated on a Rogers RO4003 substrate with height = 1.524 mm, ε_r = 3.55 and tan δ = 0.0027. In this design, by considering that the ka value for electrically small antenna must be smaller than 0.5, the whole size of the proposed antenna is 8.5 mm × 8.5 mm that at 2.4 GHz frequency ka = 0.302. A circuit simulation result has been also obtained using ADS software. The measured results show that a -10dB impedance bandwidth from 2.28 to 2.5 GHz is achieved. It can be observed that there is a frequency shift about 120 MHz (2.52 GHz to 2.4 GHz) between two full wave simulation, i.e. HFSS, and the modal analysis, i.e. HFSS, results. This difference is due to the excitation method, different numerical methods, i.e. MoM and FEM, and loss tangent of the substrate. In the modal analysis, the loss tangent of the substrate is neglected; however, the difference between lossless and lossy substrate is small [16].

CONCLUSION

An electrically small antenna is proposed at 2.4 GHz frequency using characteristic mode theory and metamaterial-inspired antenna. The antenna consists of a microstrip-feed-line on top of the substrate and a single parasitic material unit-cell on the bottom of the substrate. This antenna has a small dimension of 8.5 × 8.5 × 1.524 mm^3 (0.068 λ0 × 0.068 λ0) and ka value of 0.302. The antenna performance is studied numerically. This antenna is one of the smallest electrically small antennas available at this frequency. It can be a good for future compact wireless devices that require a compact and simple antenna structure with a good performance.

ABSTRACT

Diwali has been one of the largest festivals in Hindu religion which usually fall in the month of October to November every year. At the time of the festival days excessive amount of burning of fire crackers takes place mostly in evening time. Fire crackers pollute the environment with noise, particular matters and chemicals. There are some reports which is known the impact of particles of fire crackers but none of them are plants. The present study is performed to know the impact of fire crackers on plants and environment. The plants parts which are collected after Diwali in the year of 2019 at 6 different areas in Odisha, India. After the experiment the most amount of chemical which is used in fire crackers is CaO (Calcium Oxide), which is a white, caustic, alkaline, crystalline solid. The fire crackers shows more impact on plants. The study shows that plants are also susceptible to the chemicals emitted by the fire crackers when they are burn out.

Keywords : Diwali, Festival, Plants, Crackers, Strontium

INTRODUCTION

Diwali is commonly known as the festival of lights. It is mostly celebrated, so the fire crackers are burnt by the people. Diwali festival usually occurs in October / early of November and this is celebrated so vastly (1). Usually people startburning fire crackers before 2- 3 days. Fire crackers are exploding in the atmosphere and shows the impacts on plant. After the experiment it is found that in plants after the Diwali the chemicals contain are SiO_2, P_2O, SO_3, Cl, K_2O, CaO, TiO_2, MnO, Fe_2O_3, NiO, CuO, Zno, Br, Rb_2O, SrO and so on. In the recent time the air quality impacts on plants is too dangerous which on shows badly. To this respect special air quality degradation on plant

that has been reported due to bursting of fire crackers in Diwali (2). The chemicals and their components that are used in the crackers are Strontium, Calcium, Sodium, Barium, Copper, Magnesium, Aluminium, Titanium etc. Due to burn of huge amount of fire crackers mainly on the day of the festival and the day before and after the festival (considered as Pre-Diwali and Post- Diwali days) (3). The gases which has been out of the burnt fire crackers are in such a manner it is trashed that the gases are fixed with the plant that are to be detected by the experiment. Fire crackers affects the environment, some of the rockets set fire to huts, heaps of dry grasses and houses. In the present study, we found many chemicals but CaO is found much amount in the plant species. The CaO isused as the burning particle in the crackers.

METHODOLOGY

COLLECTION

The plants and plants parts has been collected from different 6 areas of Odisha. The places where the plants have been collected are Lakmi Sagar, Jharpada, Samantarapur, BDO Colony, Palla, Sagwanbagicha. We had choose those places because there was more amount of burst of fire crackers as compared to other places.

IDENTIFICATION

The plants which we have collected we identified those plants and named it. Then we have send those plants to the ATC Laboratory. Then it has been examined and identified that how much amount of fire crackers are found in the plants.

RESULT AND DISCUSSION

Study on the documentation of plants which shows impacts on Diwali crackers in different areas of were carried out after the Diwali. The data on the impact of Diwali fire crackers was collected through interaction through the specialist (4). In Hindu custom it has been accepted that Diwali has been one of the largest festivals in Hindu religion which usually fall in the month of October to November every year. The six plant samples were collected from six different areas of Bhubaneswar, Odisha i.e Kaniara (*Cascabela thevetia),* Arakha (*Calcotropis ginantea),* Mandara (*Hibiscus rosa-sinansia),* Malati (*Aganosma heynei),* Kaicha kakudi (*Coccinia cordigolia),* Tagara (*Tabernaemontana divaricate).* Burning of sulfur nitrates, magnesium, aluminum, paper, and different materials contained in firecrackers produces air contamination during Dials. During XRF analysis the elements like CaO, SO_3, ZnO, NiO were found to be highest in plant parts after Diwali (Table 1). This study showed that the burning of crackers on Diwali is a solid wellspring of air contamination which contributes an altogether high measure of metals in air.

CONCLUSION

The study based on effects and impacts of crackers used in Diwali on plants and plants parts. The present study helps to realise that Diwali which is the festival of lights, but we, the humans have made it into a noise and pollution. Not just human beings, but also animals and plants are impacted by the fire cracker culture. If plants could speak, they would definitely beg cracker lovers not to use crackers during Diwali. After crackers burst in the air, they emit toxic gases in the atmosphere that are extremely damaging to the health of all living beings, including plants. This study greatly revels that the plants are living and they need cares during lighting crackers and fireworks. Plants feel suffocated and cry for help when Diwali crackers burst.

ABSTRACT

For dynamic behaviour modelling and simulation and the interaction between systems of many fields of engineering, such as mechanical, electrical, thermodynamic, hydraulic, pneumatic, thermal and control systems, Dymola is offering new and revolutionary solutions.Three separate efforts have been made in three different institutions in recent years to provide electronic circuit modelling and simulation capability as an object-oriented general-purpose environment for the design of physical structures in Modelica.There is no hard-coding domain knowledge to use in Modelica software.Not physics, but only mathematics, understands Modelica.Accordingly, all subject information shall be included in the layout.Recent software and symbolic algorithms have enabled the complete electronic circuit simulator to be implemented in Modelica without sacrificing the runtime for the resulting simulation.In this process, the improvement of the transparency and ease with which the code is maintained is significantly improved, and the flexibility to combine the electronic models with the mechanical and thermal ones dramatically improves. Analog inverter circuit using BJT, comparator , and noninverting amplifier using OPAMP were designed in Modelica modeling of Dymola software and simulation results were obtained.

Keywords: Electronic circuit simulation, modeling, Modelica, simulation, analog

INTRODUCTION

Dymola was designed to be an equations-based declarative rather than a proceedings-based language.The causality of each equation is determined automatically by the model compiler, i.e. the variable the equation needs to solve..A compiler is invoked to convert implicit (declarational) model specifications into an express (procedural) state-space shape in symbolic formula manipulation algorithms.An off-shelf CSSL-type simulator can then simulate the resulting simulation code.The semantic gap between the original implicit model specification and the outcomes may be quite large from a historical point of view.However, from a use perspective, OOMLs are a real revolution, as they allow modellers to treat all models in the same way.The modelling environment for control systems no longer needs to be distinguished from one for electronic circuits.Although it is possible to build an OOML model of a circuit by

using conventional Spice implementations to be a little slower than the corresponding compilation, the results of simulation coding in the exercise speed can be equally efficient.In the meantime Model [1] has substituting the most commonly used OOML for Dymola[2].While Elmqvist developed and commercialised the Dymola language as a proprietary code, Modelica was created and not owned by a standard committee.Anyone can develop a compiler and a basic simulation engine based on the language of the Modelica and, indeed, several Modelica implementations already exist.Modern Dymola[3] is an environment based on Model Language Specification among several M&S environments.Dymola offers a visualisation and animation of simulation results, the Modelica compiler, a CSSL-type simulation engine, and several other tools for model manipulation including linearization engines. Dymola also has the graphical user interface (GUI).This M&S environment is Dynasim 's commercial code.Open Modelica [4] is a free (open source) Modelica compiler implementation.Open Modelica [4] is a free (open source) Modelica compiler implementation.A CSSL-simulation engine is provided for the code.It also offers a (simple) results visualisation programme, but for the visualisation of their simulation results, many open modes users choose Matlab[5].As a GUI to OpenModelica, MathModelica Lite [6] can be used.The advantages and disadvantages for Dymola as well as OpenModelica.Because the code is more developed, easier to use, has more features, is more professional, and creates more functional, simulation code, industrial users can prefer Dymola.Academics may prefer OpenModelica, as the code is free and open-source, allowing additional resources to be developed and other algorithms to be put in place easier than Dymola [7].This article is based on Dymola as it focuses on the conception of Modelica libraries, not on new algorithms.

Analog electronic circuits simulation in Modelica

There are three modelica libraries of analog electronic circuits are available (a) The modelica standard library (b) SPICELib (c) BondLib. The analog inverter circuit using BJT, Comparator circuit, and noninverting amplifier circuit using OPAMP are designed and simulated in Modelica.The individual inputs and output waveforms are shown as simulation result.

Modelica denotes a language definition as well as a model library in Modelica language.The Modelica library is called the standard library of the Modelica, which is in the Public Domain and is intended for all Modelica implementations.A sub-library of models containing electronic circuit components, one for digital (logic) circuit elements and another for analog circuit components, contains a Modelica standard library.The analog electrical library contains model elements of the passive electrical components as well as the transistor and diode models and the current and voltage models (resistors, condensers and inductors).The standard library transistor models are significantly simpler than those in Spice 's applications.The standard library transistor models are significantly simpler than those in Spice 's applications.These models are therefore not suitable for integrated analogue circuit design.Spice implementations also offer different types of analysis, especially DC analyses, AC analyses and temporary analyses.For transient analysis only, Dymola is designed.The ease of transistor models in the standard library, on the other hand, is also beautiful.These models can be very effectively simulated and the large transistor circuits can be simulated efficiently.In addition, teacher who wish to teach students the basics of analogue circuit design can be rewarded for the simplicity of these models.Finally, the standard library also offers models of thermal analog circuit components which permit circuit designers to model, and simulate electronic circuit thermal storage and dissipation not possible in Spice, as electrical circuit models are simulated alongside mechanical system models, allowing Dymola to model and simulate mechatronic systems in an elegant mannerand simulate mechatronic systems.The modelling and simulation of electronic circuitry using the Modelica Standard Library may be illustrated using a simple analoginverter circuit.The BJT circuit diagram of the analogue inverter is illustrated in figure 1.Essentially, the circuit diagram is identical to the circuit diagram corresponding to the preprocessor Spice by any schematic capture programme.A single bipolar crossover transistor (BJT) is provided in the circuit.In the modelica language itself, Modelica "Soft," contrary to Spice's "hard" encoding its device models in Fortran or C, encodes the entire field knowledge of its models.The compiler Modelica encapsulates only math.As a result, Modelica models are significantly easier than Spice models to understand, maintain and upgrade.In Dymola, four individual entities represent each object (model).This consists of an iconic (graphic) image used to graph the model to be invoked

hierarchically at a higher level; a diagram (graphic) representing the inner structure of the template using the interconnected set of submodels; a representation equation (textual) that permits the model to be described with (implicitly formulated) equations;In the example above, the diagram layer describes the inverter circuit.The Modelica compiler can convert the inverter circuit model into a state-space model.The Dymola simulator uses the numerical ODE solver DASSL by default.For the complete simulation, it took 0.04 sec.The circuit undergoes a transitory period during the initial period as the model did not start in a recessed state.In Spice, the user would normally precede the transient analysis by calculating a DC OP point that would eliminate the transition from the results of the simulation.

SPICELib

A few Modelica users have written their own library in addition to the Modelica standard library.Some of these libraries are business libraries, while other libraries are free.One such free library is SPICELib. PSpice is one of Spice's most common dialects.Many models are therefore familiar with PSpice equipment parameters and PSpice parameter sets for most commercially available electronic devices have been identified.SPICELib has a long tradition of offering different models for the different types of analysis. For example, one SPICELib model contains several models, one for DC analysis and another for AC analysis and one for transient analysis. SPECILIB follows the traditional Spice philosophy.As a result, the SPICELib connectors are incompatible with the electrical library's standard connecting systems and, therefore, unfortunately SPICELib and the standard component models cannot be mixed.Just as with the standard library, the SPICELib component models using the equation layer have been implemented.These models are, however, much more complex now, and are less understandable and easier to maintain.At the top, these are full flavours for circuit design that can be used.Moreover, it is particularly convenient for experienced PSpeice users to switch to Modelica if they decide on PSPice and SpICELib similarity and the availability of separate models to the various analysis types.Our demo circuit cannot however be simulated in SPICELib at present because SPICELib offers only MOSFET models.There have been no releases of the BJT and JFET models.

BondLib

The BondLib library is another free, bond-graphy library.Domain-independent modelling is provided in Bond graphs.Bond graphs are the most fundamental paradigm of still fully object-based graphic modelling.The need for modelling using the equation layer can be greatly reduced by mapping higher-level models to a link graph layer, which enhances the understanding and maintenance of the models. BondLib has an electrical analog subsection, which appears to be quite similar to the respective subsection of the Modelica Standard Library.However, each component model is decomposed to a bond graph layer graphically more closely.BondLib also includes real Spice models, in contrast to the standard library.However, its Spice models are based on HSpice ([14]), another Spice dialect with sets of device parameters that differ slightly from PSpice.HSpice and BondLib provide their device models with diverse levels of complexity.More complicated models at higher level have more device parameters and are therefore slower to implement.BondLib contains only temporary analysis models, just like the standard library.For this reason, the BondLib power connectors are compatible with the standard library electrical connectors, and both models can be mixed freely.In BondLib, however, the BJT models contain a (green) additional port which denotes the substratum, and all device models have an additional (red) thermal port.The BJT model consists of an internal model BJT plus the collectors, emitters and (nonlinear) resistors, a base-substrate interconnection diode and a nonlinear straying capacitance between the external foundation and the internal collector nodes. (in the case of laterally diffused BJT).It includes the typical nonlinear gummel-poon crossing ability, the true diode characteristic, and a stray conductance (with numerical motivation).The bond graphic device models are at the next lower (still graphic) level.Small equation models implementing the primitive graphs are below that level.At first there are 2624 unknown equations in the model.Most of these equations are trivial equations, however, which are removed compilation in the process.There are three state variables and 162 algebraic variables in the simulation model.It is as straightforward as a complex model can be expected.Each of the three diodes has a one-state crossover capacitance.External stray capacity is a dependent capacity that does not result in a supplementary state variable.It is removed by a symbolic index reduction during the compilation process.There are no more than two state variables in

the standard BJT model because it does not include a substrate model.The BondLib model compilation is obviously slower than the standard model, but Dymola is very effective in building it.Both builds only consume one-second splits.The simulation is also slower than the equivalent circuit using the standard library, as the model is significantly more complicated.The slow-down of the simulation is however less than an acceptable factor of 2.First of all, BondLib's BJT model has the basic, collector and emitter connexion resistors (in accordance with the Spice philosophy) whereas the standard library's BJT model doesn't.These are externally to be added.It should not neglect their influence.In particular, the basic resistor (about 1000 ohm) is quite large.Secondly, BondLib supports DC analysis that is not contained in the standard library.A newton iteration traditionally calculates a DC OP point in Spice.That is not done by BondLib, but rather by increasing the source, it computes a DC OP point.If all the active devices are switched off initially and all sources initially at zero, then all the voltages and currents are zero physically plausible.We can therefore begin with this solution, ramp all sources up to their initial values, and keep them for a while before the transient analysis begins.BondLib provides the source of the ramping to enable the user to specify the time for each.

AC analysis inBondLib

We need an input / output model to linearize around a suitable stable point.A good stationary point is the final state of temporary simulation.It is automatically saved by Dymola in the dsfinal.txt file.We must return quickly to the modelling window, select the Operating Verstorage Circuit model and return to the simulation window.We must now read as initial states the final values of the transitional analysis.The Continuance / ImportInitial... command in the simulation pull-down menu requests you to select the readable file, the dsfinal.txt file.Then the circuit around the initial state must be linearised.This is also done by the Linearize command in the simulation pull-down menu.The linearized model is stored in the dslin.mat file.The actual AC analysis is not conducted in Dymola.itself, but instead using Matlab's toolbox control systems.The bandwidth of the operating amplifier is approximately 1 MHz.The amplitude and phase features are both beautifully flat up to this frequency.BondLib is not specific to the approach described here.The same approach could just as easily have been applied to model the high gain operating amplifier circuit using the standard library.The approach, however, is unique to Dymola M&S.Nothing supports linearization in the specification of the modelica language.Therefore, other Modelica implementations either will not support this feature or at least will not support it the same way.The suggested approach is more object-driven than SPICELib 's approach, because all three types of analysis can be carried out using the same model.The maintenance of the code is simplified.However, SPICELib 's approach is easier to use, since it allows modellers to analyse the AC using one single command, as in Spice.Using OOMLs to model and simulate electronic circuits offers several striking advantages over using Spice.These are listed now.

Mechatronics

Industry now constantly requires computer and mechanical circuit co-simulation.For instance, automobiles manufacturers want the electronic control circuit of their engines simulated with the engines.It even got its own name, mechatronics, the area was so popular.In Spice it is not possible to simulate mechatronic systems because Spice allows modelling systems other than analogue electronic circuits.Mechatronic structures of OOML like Modelica.

Thermalanalysis

Heat dissipation is a big concernwith the increasingly rising density and speed of electronically integrated circuits.While Spice allows the simulation of an electronic circuit at different temperature values, it does not feature.Using an OOML and especially one based on bond graph technology, performing electronic circuit thermal analysis is a breeze.

Softwareupgrades

The built-in DC analysis often do not converge on their analogue circuit to produce an automated ramping characteristic.Similar demands can be processed in a few hours using a language such as Modelica because Modelica stores its specific domain knowledge in the model instead of in the compiler.

Teaching

Although spices can be used to check circuits, they cannot easily be used to demonstrate how transistor models operate.The reason is that Spice transistor models are black box models that can only be viewed from outside.Although many of the Spice handbooks display equivalent replacement circuits based on the transistor models, the student does not have access to their internal signals.The student can actually view the replacement circuits and dig them to any level he or she chooses, especially when embracing the approach adopted by BondLib, even down to the bond graph models at the bottom of the graphic model here.This allows BondLib to be used in the teaching of basic semiconductor technology effectively and efficaciously.

CONCLUSION

Modelica has been an outstanding tool for scientists and engineers to share information on complex systems.Models can be freely interchanged and combined to simulate mixed energy systems.It consists of sub-libraries for electrical , mechanical and hot systems, a block diagram library describing control structures, a state graph library describing discrete structures, a network library for convective flow modelling systems, and a widely used scientific library and a physical library for universals constants.. The standard library is easily the largest volume of information about dynamic systems freely available on the public domain.It is planned to become the most important one-place-shop-all tool for physical system modellers worldwide.There are also growing numbers of free libraries available on the Modelica website, including SPICELib and BondLib, maintained outside the standard library.These libraries should undergo frequent modifications and enhancements.Until now, we have focused primarily on analog circuits. Analog inverter circuit using BJT, Comparator and noninverting amplifier circuit using OPAMP were designed and similuated.

There is also a definite need to simulate mixed analog and digital circuits, such as switched power converter circuits, that neither Spice nor LogicWorks can handle.

ABSTRACT

Alternative fuel forinternal combustion engine is a topic which is attracting many researchers in recent times due to depletion of fossil fuels. It also reduces pollution and protects against global warming. Among different alternative fuels, biodiesel is regarded as a major source as a substitution fuel for internal combustion engine which has similar properties with diesel. India has a great scope for the production of biodiesel from nonedible oil seeds due to abundance of vegetable plants. Raw vegetable oils can be used directly or blended with diesel to run diesel engines. However the engine modification is a challenge for its usability aspect. Also there may be occurrence of serious problems in fuel ignition if the viscosity of the oil is not taken care of. In the present work, a dual blended biodiesel of Castor and Mahua is used as fuel for variable compression ratio diesel engine to test its performance without any modification of the engine. The performance results obtained are within acceptable limits.

Keywords: Performance, Biodiesel,Blend, Castor, Mahua

INTRODUCTION

Biodiesel is accepting extraordinary consideration as a result of its fuel properties and similarity .It has preferable properties over that of petroleum diesel.It is a naturally agreeable fuel that can be utilized in any diesel engine. Biodiesel is an elective type of diesel got from either plants and plant item or creature fat [1]. It is an elective diesel fuel, which is supplied by synthesizing vegetable oil or creature fat with liquor, such as methanol or ethanol, for example.That synthetic response which changes over a vegetable oil or creature fat to biodiesel is classified "transesterification" [2]. The synthetic response used to make biodiesel requires an impetus. An impetus is typically a substance, which added to the response blend to accelerate the response.

Since biodiesel is made altogether from consumable and nonedible oils, it doesn't contain any sulphur, sweet-smelling hydrocarbon, metals or unrefined petroleum deposits. The lacking of sulfur implies a decrease in the development of corrosive downpour by sulfate emanations which create sulphuric corrosive in our air. The diminished sulphur in the mix will likewise diminish the degrees of destructive sulphuric corrosive assembling in the motor crankcase oil after some time [3].

Ghaly et al. [4] revealed that the exploration on the creation of biodiesel has expanded surprisingly lately as a result of the requirement for an elective fuel which invests with biodegradability , low harmfulness and sustainability.Deepanraj et al. [5] portrayed that the less mixes of biodiesel expanded the brake warm effectiveness and limited the fuel utilization. Moreover, biodiesel mixes produce lower motor emanation than diesel.

Biodiesel is delivered by means of the transesterification response among oils within the sight of a suitable impetus [6]. All in all, either homogeneous or heterogeneous, and salt or acidic impetuses can be utilized in the transesterification response to boost transesterisation response execution and upgrade biodiesel creation returns [7]. Transesterification process within the sight of salt impetuses is a general procedure for biodiesel creation, since this response within the sight of soluble base impetuses is around 4,000 overlap quicker than within the sight of acidic impetuses, making the procedure all the more monetarily feasible [8].

In the present work, equal amounts of castor oil and mahua oil are mixed together for better outcome. And furthermore it is another method of making biodiesel by including or mixing of these two oils combine. When biodiesel is at first mixed, as it ventures to every part of the conveyance arrange until it arrives at the end goal of the fuel siphon or capacity tank. Biodiesel can be mixed with other fuel to deliver mixed biodiesel fuel base on weight premise or volume premise. The last result of blending ought to be homogeneous. Diesel fuel and biodiesel, with certain blending rate on volume premise, ought to be miscible in one another at the encompassing conditions and this as of now exists as blended powers, for example B5, B10 and so on., are sold at encompassing conditions and they are absolutely miscible. On the off chance that you need, you can test blending process tentatively at encompassing conditions and certain scope of low blending speed, for vitality sparing, at that point watch the ideal blending conditions. In the event that blending isn't acceptable you can rise blending rate or quest for certain added substances, for example surfactants, to achieve blending process.

MATERIALS AND METHODS

Castor is generally utilized as feedstocks for decrease of biodiesel,as its development needn't bother with significant expense and furthermore its concentrates contain 40-55% of oil in particular .Castor oil contains 80-90% of hydroxyl unsaturated fat, ricinoleic corrosive and about 10% of non-hydroxylated unsaturated fats, basically oleic corrosive and linoleic acids which causes a drawback for its utilization for biodiesel creation, since its thickness is around multiple times higher than the others. Ricinuscommunis, is ordinarily known as castor is a perenial blooming plant has a place with family euphorbiacae, these plants are local to tropical Africa and discovered to a great extent in the hot territories of the world.

Mahua oil got from mahua seed and castor oil is likewise extricated from castor seed. Mahua has a place tospecies of sapotaceae.It is an Indian tropical tree found over the northern part.Mahua oil is acquired from the piece of mahua seed (MadhucaIndica) which have 50-55% oil.The oil contains unsaturated fats like those in cooking oils as oleic corrosive, Linoleic acid.Stearic corrosive and palmitic corrosive. The particular gravity of mahua oil is 9.11% higher than diesel. The kinematic thickness of Mahua oil is 15.23 occasions more than diesel at temperature of 400 C .The kinematic consistency of mahua oil diminishes with increment in temperature upto 800 C and by expanding the proportion of diesel in fuel mixes.

The preparation of biodiesel from mixture of castor and mahuaoil is fundamentally done by transesterification process. This procedure should be possible in three phases as follows.

Pre-Process (Esterification)

1 liter of mixture of castor and mahuaoil was heated at 110°C to remove moisture content. After that the oil was cooled and 10gm of H_2SO_4 and 200 ml of methanol was added and mixed well. Then the oil mixture was placed in the biodiesel reactor and heated for 3hour maintaining the temperature 60-64 ^{0}C. After 3hour, the sample was cooled and collected in a separating funnel then on the next day the sample was filtered and the unreacted methanol was separated and the remaining product was transesterified. Esterification reaction is mostly used for reducing the FFA level of oil.

Main Process (Transesterification)

The esterified test was blended with 10g of KOH and 200 ml methanol. The blend was then warmed up to 3hour at 700°C in a biodiesel reactor with nonstop mixing .Then the sample was cooled and kept in an isolating channel. At that point on the following day we seen that two layers were framed and the upper layer which is the methyl ester was isolated from the lower layer which is the glycerol. Transesterification response is utilized for changing over unsaturated fat into unsaturated fat methyl esters. Transesterification can be completed by either corrosive impetus or antacid impetus. The term transesterification alludes to ester exchange response is transformation one ester to other. This incorporates all blends of association between monohydroxy liquor esters, mono and health food nuts of glycol mono di and triglycerides and the different esters of tetrahydroxy and higher liquor are conceivable. The ester – ester exchanges of materials expected for non-eatable mechanical uses are without a doubt getting progressively significant when applied to fats and oils ester – ester trade may improve physical properties since it changes acyl bunch course of action inside the parts of the blended triglycerides of fats and oils ester-ester exchanges might be influenced without impetus at high temperature at 1500C or more. Ester-ester exchange happens at quick and at less temperature by utilization of either corrosive or basic impetus. Ester trades continue aimlessly. This will bring about compositional changes; the greasy acyl bunches inside triglyceride to all the conceivable mix.

Post Process (Water Wash)

The methyl ester which is acquired is then water washed to evacuate the rest of the glycerol and debasements of arrangement. The methyl ester was blended in with water in 1:3 proportion and shaked well for 2 minutes and it was kept for 15 minutes. After that water was contracts debasements and the unadulterated methyl ester was gathered. This procedure was rehashed for 5-6 times. The gathered sample after water wash was warmed at 1100°C for 40-50 minutes then the biodiesel was collected.

Performance Test

The dual blended castor-mahua biodiesel is blended with diesel to get the desired fuel for testing in diesel engine. The prepared dual biodiesel of castor-mahuaB10 blend and castor biodiesel of B10 blend prepared by the prescribed method, were then tested in variable compression ratio engine shown in Fig.2, where there is a provision to change the compression ratio by changing clearance volume of the engine cylinder. The engine was started and run idle for 10 minutes. Now the compression ratio of the engine is set at 18. Then dual castor-mahua biodiesel B10 blend was poured in fuel tank and the engine was run with no load condition. The load was increased to 2kg by means of variac. Important performance parameters of the engine such as Brake Power (BP), Brake Thermal Efficiency and Specific Fuel Consumption (SFC) were obtained from a computer integrated with VCR engine. Gradually the engine load was increased to 4, 6 and 10 kg and corresponding values of performance parameters were recorded. This procedure was followed for B10 of castor biodiesel.

RESULTS AND DISCUSSION

The performance comparison of VCR engine using dual blend of castor-mahua B10, castor biodiesel of B10 blend and conventional diesel was shown in Fig.4-6. The key performance parameters which were taken into considerations were Brake Power (BP), Brake Thermal Efficiency and Specific Fuel Consumption (SFC). It is observed from the Fig. 4 and Fig. 5 that the Brake Power (BP) and Brake Thermal Efficiency of dual blended castor-mahua biodiesel blend B10 has been enhanced than castor biodiesel of same blend due to addition of equal quantity of mahua oil. For pure diesel, the values of Brake Power and Brake Thermal Efficiency are found to be highest among three fuels. This is due to more calorific value of diesel than other two fuels. However, at higher loads, the percentages increase in Brake Power and Brake Thermal Efficiency diminishing. The Specific Fuel Consumption (SFC) of dual blended castor-mahua biodiesel is slightly more than castor biodiesel. But that increase may be underestimated due to increase in more influential performance parameters like Brake Power and Brake Thermal Efficiency. Moreover there is no modification in engine which supports its usability as a fuel for internal combustion engine.

CONCLUSION

The performance tests of variable compression ratio diesel engine were conducted with diesel, castor biodiesel and dual blend of castor-mahuabiodiesel at different loads and constant speed 1500 rpm at fixed compression ratio 18. India being an agricultural country, the energy from bio sectors will be highly beneficial for both plantation as well as transportation. Thus dual blended biodiesel of castor and mahua oil will be a highly beneficial fuel in terms of both economy as well as fuel independence because these oils will be easily available as long as air and water are available in the earth. Theperformance results obtained due to combustion of dual blended castor-mahua biodiesel are giving comparable results without any engine modifications. Hence it can be considered as a good replacement for conventional diesel fuel at lower blends.

ABSTRACT

The layered structure bismuth oxide ceramic $SrBi_2V_2O_9$ (SBV) belonging to the family of Aurivillius type was synthesized by solid state reaction method. The X-ray diffraction study reveals the orthorhombic crystal structure at room temperature. The dielectric properties (εr and tanδ) of sample at different frequencies in a wide range of temperature (25°-500°C) have been studied with an impedance analyzer. The studied sample has a dielectric anomaly at around 120°C.

Keywords: Solid state reaction; XRD; Dielectric Properties;

INTRODUCTION

The family of layered bismuth oxides ceramics was first reported by Aurivillius **[1],** while studying the Bi_2O_3-TiO_2 system which is now referred to as Aurivillius structure. Later on there are numbers of layered bismuth oxide materials from this family were reported which showed the ferroelectric properties **[2, 3].** The Bismuth Layer-Structured Ferroelectrics (BLSF) material is excellent candidate for nonvolatile Ferroelectric Random Access Memory (FRAM) in various commercial applications. There are various BLSF materials such as $SrBi_2Ta_2O_9$ (SBT), $SrBi_2Nb_2O_9$ (SBN), $SrBi_2$ $(TaNb)_2O_9$ (SBTN), have been obtained much attention because of their merits of fatigue resistance, lead free composition and FRAM characteristics [4]. Bismuth layered perovskites have high fatigue resistance that makes them capable to withstand 10^{12} erase or rewrite operations [5]. The general formula for BLSF is $Bi_2A_{m-1}B_mO_{m+3}$, where A= Bi, Pb, Na, K, Sr, Ba, like rare earths; B=Ti, Nb, Ta, Fe, Mo, W, Cr and m=1-6 [6]. The vanadium pent oxide (V_2O_5) was found to be an effective microstructure modifier and grain growth truncator for the $SrBi_2Nb_2O_9$ (SBN) ceramic. The materials $Bi_4V_2O_{11}$ is a layered structure bismuth oxide comes under Aurivillius family which shows three essential polymorphs phases like monoclinic, orthorhombic and tetragonal phase [7,8].

Realizing the importance of V_2O_5, we have synthesized and studied the structural, dielectric properties of $SrBi_2V_2O_9$ (SBV).

Experimental

The ceramic sample Strontium Bismuth Vanadium Oxide-$SrBi_2V_2O_9$ (SBV) was prepared by solid state reaction method using ingredients: $SrCO_3$, Bi_2O_3, V_2O_5 in a suitable stoichiometric proportion. The ingredients were thoroughly mixed by using an agate mortar and pestle in air-atmosphere and methanol. The mixed powders were calcined at an optimized temperature 600°C for 4h. The quality and formation of the calcined powder were checked through an X-ray diffraction (XRD) method at room temperature using CuK_α radiation (λ=1.54 Å).Then the calcined powder mixed with PVA (polyvinyl alcohol) as a binder was cold pressed into cylindrical pellets using a hydraulic press. The pellets were sintered at 650°C for 4h. The PVA which was used as binder to reduce the brittleness of the pellets, burnt out during sintering. In order to analyze the electrical properties of the sample, the sintered pellets were electroded with air-drying conducting silver paste. After electroding, the pellets were dried at 150°C for 4h to remove moisture, if any and then cooled to room temperature before taking any measurement. The dielectric measurements were carried out using a LCR meter (HIOKI Model 3532) in the frequency range of 10^2-10^6 Hz at different temperatures (25-450 °C).

RESULTS AND DISCUSSION

Structural Study

The room temperature XRD pattern of the studied sample SBV is shown in the Fig.1 All the reflection peaks of pattern were indexed in different crystal systems and unit cell configuration. An orthorhombic crystal system was calculated on the basis of good agreement between observed (obs) and calculated (cal) interplanar spacing d ($\sum\Delta d = d_{obs} - d_{cal}$ =minimum). The lattice parameters were refined using a standard computer program package "POWD" [9] and found to be a= 14.9706Å, b= 4.2677 Å, c= 10.4961 Å. The volume of the unit cell is V=670.59. The crystallite size (D) of the sample was determined by using Scherrer's equation [10] i.e., $D= k\lambda/(\beta_{1/2}\cos\theta_{hkl})$ and found to be 38 nm, where k= constant=0.89, λ=1.5405 Å, $\beta_{1/2}$=peak width of reflection at half intensity.

Dielectric Study

Fig. 2 shows the variation of dielectric constant (ε_r) and loss tangent (tanδ) with frequency at room temperature. It is observed that both the dielectric constant and the loss tangent decreases with rise in frequency at room temperature. At higher frequencies, the significant contribution to the dielectric constant is the electronic polarization where the other polarizations in the material become ineffective. A similar type of result has been reported by Kalaiselvi *et al* [11] by the study of SBVN [$Sr_{0.8}Bi_{2.2}(V_{0.2}Nb_{0.8})_2O_9$].

Fig. 3 shows the variation of dielectric constant (ε_r) with temperature at different frequencies. It is observed that ε_r increases gradually on increasing temperature to its maximum value (ε_{max}) and then decreases. A dielectric anomaly is observed around 120 °C. Above the temperature around 200 °C, the increase of ε_r may be due to space charge polarization which comes from mobility of ions and imperfection in the material. The dielectric anomaly which was observed at 120°C found to shift towards low temperature side with increase of frequency and this variation has been shown Fig 3 (inset). Similar trend of variation is observed in tanδ as in ε_r as a function of temperature also shown in Fig. 4. An anomaly in tanδ may be attributed to the dielectric relaxation in the material. The higher value tanδ at high temperature may be due to space charge polarization. Similar type of result has been reported by Yan *et al* [12,13] for different ceramics.

CONCLUSION

The layered structured bismuth oxides ceramics sample of $SrBi_2V_2O_9$ (SBV) was prepared by solid state reaction technique. The studied compound belongs to Aurivillius family and X-ray structural analysis exhibits the orthorhombic structure. The dielectric constant decreases with increase of frequency which is a general behaviors of dielectrics. The dielectric constant increases with increase in temperature and then decreases. Studies of the dielectric properties showed that the compound undergoes an anomaly at 120 ^oC and this anomaly shifted to lower temperature sides on increasing frequency.

ABSTRACT

The depletion of petroleum fuels is a major concern now a day. The growth in automobile sector and population are the prime causes for it. Moreover the emission from vehicles that uses petroleum fuels such as petrol, diesel and kerosene possess a threat to the environment and mankind. The major gases coming out from the vehicle emission such as Carbon Monoxide (CO), Carbon Dioxide (CO_2), Oxides of Nitrogen (NOx), Hydro Carbon (HC), Particulate Matter (PM) are polluting atmosphere to great extent. Many researchers have proposed several ways of reducing pollution by using alternate energy sources. Use of biodiesel as a liquid alternate fuel is one of the biggest achievement so far. As the name suggests, it can be produced from biofuels and has similar properties with conventional diesel fuel. The wide availability of plant such as karanja, Mahua, Sunflower, Kusuma, jatropha, Castor is favourable for biodiesel production. Researchers are going in favour of different non edible oil sources because they are non-consumable for human being. Characteristics of these oils need to be carefully studied before proceeding for biodiesel production. However the use of biodiesel as fuel for vehicles decreases the performance slightly due to less calorific value as compared to conventional diesel and petrol. But on the other hand, there is a significant reduction in pollution level as reported by different researchers. In this work, a mixed biodiesel blend of Mahua and castor has been prepared and used as an alternate fuel to run a diesel engine. The results obtained give a reduction in emission gases as compared to castor biodiesel of same blend.

Keywords : Emission, Diesel Engine, Biodiesel, Blend, Castor, Mahua

INTRODUCTION

Biodiesel is an alternative fuel for diesel which is derived from either plants and plant product or animals. It is produced by chemically reacting a vegetable oil or animal fat with an alcohol such as methanol or ethanol. That chemical reaction which converts a vegetable oil or animal fat to biodiesel is called "transesterification".Ghaly et al. [1] told that the research on the production of biodiesel has increased significantly in recent years because of the need for an alternative fuel with low toxicity and renewability.Deepanraj et al. [2] described that the lower blends of biodiesel increased the brake thermal efficiency and reduced the fuel consumption. In addition to that, it was reported that biodiesel blends produce less engine emission than conventional diesel fuel.Mahalingam et al. [3] carried out their research on emission analysis of a diesel engine by using biodiesel blends of mahua and alcohol. Rathore et al. [4] carried out experimental analysis on performance and emission of modified diesel engine by using mixed biofuel blends of coconut and karanja. Bajpai and Das [5] did their experimental work on running engine with different biodiesel blends of Jatropha, Karanja and Castor. They found lower blends were giving the performance result close to diesel oil. Jena et al. [6] carried out their investigation on biodiesel preparation from mixture of mahua and simarouba oil and reported comparable fuel properties with diesel. Foroutan et al. [7] produced biodiesel from waste edible oils in the transesterification process by using nano catalyst of magnesium and calcium. Despite so many works on biodiesel, much work has not been done with mixed biofuel blends.

In this work, the mixture of two different oils i.e. castor and mahua were mixed together in equal proportion and was used to prepare biodiesel. The prepared biodiesel was used to run a diesel engine and exhaust gases coming out of the tail pipe was analysed to determine the percentage of exhaust gases. The engine was also run with prepared castor biodiesel of same blend separately. A detailed comparison of the constituent of the engine emission was made in both cases.

MATERIALS AND METHODS

Castor is widely used feedstock for reduction of biodiesel,as its cultivation does not need high inputs and also its extracts contain 40-55% of oil only [8] .Castor oil contains 80-90% of hydroxyl fatty acid, ricinoleic acid and about 10% of non-hydroxylated fatty acids, mainly oleic acid and linoleic acids which causes a disadvantage for its use for biodiesel production.Mahua belongs tospecies of sapotaceae.It is an Indian tropical tree found across the northern part.Mahua oil is obtained from the kernel of mahua seed (MadhucaIndica) which have 50-55% oil.The specific gravity of mahua oil is 9.11% higher than diesel. Therefore, the mixing of 50% of castor oil with 50% of mahua oil is carried out at room temperature for better result. And also it is a new way of making biodiesel by adding or blending these two different oils together. The final product of mixing should be homogeneous.

Preparation of Biodiesel

1 liter of mixture of castor and mahua oil in equal proportion (1:1) was taken and heated at 110^0 C to remove moisture content. Then esterification process was carried out by heating in a biodiesel reactor as shown in Fig.1 in the presence of 10 gm of H_2SO4 with 200 ml of methanol. After 3hours of heating the sample was cooled and collected in a separating funnel. The unreacted methanol was separated and the remaining product was transesterified in the presence of 10g of KOH and 200 ml methanol solution by heating in a biodiesel reactor at 70^oC. After 3 hours of continuous heating with stirring, the sample was collected in a separating funnel. After keeping in funnel for some times, the two different layers were formed. The upper layer was methyl ester and lower layer was known as glycerol. The required methyl ester was washed several times with water until no soap bubbles were observed inside methyl ester. This is the required biodiesel which is mixed with diesel fuel to get desired blending. A blend of Castor-Mahua mixed biodiesel B10 which can be written asD90C5M5 (i.e 90% diesel, 5% Castor and 5% Mahua) was used as fuel to run a diesel engine. The exhaust gases emitted in the tail pipe was tested by using exhaust gas analyser.

Emission Test

The exhaust gas from diesel engine was analysed by means of gas analyser in pollution testing apparatus shown in Fig.2, which was integrated with the engine. The probe of the analyser was inserted in the exhaust pipe of the engine to sense the exhaust gas. The composition of exhaust gases which mainly consists four major pollutants such as CO, CO_2, $NO_x$and HC were recorded during testing of different blends of castor biodiesel.

RESULT AND DISCUSSION

Carbon Monoxide (CO) emission

The Carbon Monoxide (CO) content of the diesel engine emission due to combustion of Castor-Mahua mixed biodiesel B10 (D90C5M5) is presented in Table 1 and a comparison of CO percentage with diesel and castor biodiesel is shown in Fig.3.The percentage of CO comparison between three different fuels indicate that CO content is less for biodiesel B10 (D90C5M5) than conventional diesel and castor biodiesel of same blend. The result of carbon monoxide presence in the engine emission is due to incomplete combustion of fuel. Due to the addition of extra oxygen molecule in Castor-Mahua mixed biodiesel (D90C5M5), it results in better combustion and hence less CO content.

Carbon Dioxide (CO_2) emission

The Carbon Dioxide (CO_2) content of the diesel engine emission due to combustion of Castor-Mahua mixed biodiesel B10 (D90C5M5) is presented in Table 2 and graph is plotted by taking different loads on the engine as shown in Fig.4. It is observed from the results that CO_2 percentage for B10 (D90C5M5) is slightly more than castor biodiesel of B10 blend and diesel fuel.

Hydrocarbon (HC) emission

The Hydrocarbon (HC) content of the diesel engine emission due to combustion of Castor-Mahua mixed biodiesel B10 (D90C5M5) is presented in Table-3 and a comparison of HC content expressed in parts per million (PPM) between three different fuels are shown in Fig.5.It is quite apparent that the hydrocarbon content for mixed biodiesel B10 (D90C5M5) reduces significantly as compared to diesel and also with castor biodiesel. The reason is due to complete combustion of fuel which results in left unburnt hydrocarbon due to rich oxygenated fuel.

Oxides of Nitrogen (NOx) emission

The NOx content of the diesel engine emission due to combustion of Castor-Mahua mixed biodiesel B10 (D90C5M5) is presented in Table 4.A comparison of NOx quantity is made with diesel and castor biodiesel as shown in Fig.6. It is observed that NOx emission increases with increase in load. The result also reveals that the NOx content in emission enhances for castor biodiesel and mixed biodiesel (D90C5M5). The reason may be due to higher combustion chamber temperature of engine when it uses biodiesel as biodiesel is more oxygenated in nature. The value of NOx quantity increases slightly for Biodiesel B10 (D90C5M5) than castor biodiesel B10 blend. However at higher load that increment is very less.

CONCLUSION

The emission characteristics of single cylinder, four stroke diesel engine fuelled with mixed biodiesel blends of castor and mahua oil have been investigated. Mixed Biodiesel blend of B10 (D90C5M5) has shown reduction in toxic pollutants like HC and CO than diesel and castor biodiesel without any engine modification. CO_2 and NOx emissions wereslightly more for the biodiesel blends as compared to diesel.

ABSTRACT

Metamaterials are composite materials whose material properties (acoustic, electrical, magnetic, or optical, etc.) are determined by their constituent structural materials, particularly the unit cells. Metamaterial technolgy aims to redefine the the boundaries of materials science. These materials give excellent design versatility in the field of electromagnetic science and beyond, with their tunability under external stimuli. Metamaterials are constructed to shape a single, two or three-dimensional volume by embedding sub-wavelengths inclusions into a host medium .Such inclusions are similar to artificial molecules that can be designed to achieve the desired response of bulk material. Through this way, the metamaterial gains its properties not from its composition, but from its structure. The split-ring resonator exhibits diamagnetic properties over a small bandwidth but no magnetic materials are required for its construction. This researchinvolves electromagnetic metamaterials operating at microwave frequencies (C microwave band, nominally 4.0 GHz to 8.0 GHz) and their application to the slotted waveguide antenna stiffened structure (SWASS). The sub-wavelength inclusions take the form of electronic circuits designed using conventional printed circuit board (PCB) and lithographic techniques along with traditional circuit elements such as inductors, capacitors and resistors. The inclusions are arranged into periodic unit cells with millimetre dimensions. The bulk material response of the metamaterial will be definedvia its effective material properties such as the electrical permittivity and magnetic permeability.

Keywords: Metamaterials, slotted waveguide antenna stiffened structure (SWASS), permittivity, permeability, unit cell.

INTRODUCTION

An artificial structural feature is a metamaterial structure designed to achieve advantageous and unsual electromagneic and provide a new prospective in the understanding of material through their custom dielectric properties and tunable responses. The launch of this new field is marked by the famous paper by John Pendry [1], published in the year 2000 after Veselago's visionary proposal on a similar topic had been neglected for over 30

years. Within 10 years of Pendry's paper, metamaterials became a breakthrough technology due to their potential for clocking and light manipulation [2-6]. With the development of this new technology, more and more uses in telecommunications, sensing, aerospace, the optics (tera Hertz and infrared), and health-care have emerged. Metamaterials also demonstrate great potential for military and defense use in addition to industrial applications. The Defense Advanced Research Projects Agency (DARPA), the North Atlantic Threaty Organization (NATO), and major defense companies worldwide pay close attention to devolving this field. Devoloving in this area has become a major focus of attention.Metamaterials can revolutionize how the electromagnetic spectrum is manipulated. There are numerous interesting new ways to use the literature to build on the exotic properties of metamaterials. However, very few useful applications for killing have evolved mainly because of the narrow band and the high loss of the current metamaterial structures.This work aims to tackle the bandwidth limitation by combining electronically tunable elements with a unit cell design that permits control of the proposed metamaterial over the entire C microwave band. Within this new metamaterial unit cell, stronglylocalized electromagnetic fields and current are used to improve the performance of the slotted waveguide antenna stiffened structure (SWASS).

Development and Future

As highlighted in the comprehensive review by Kadic et al. titled *Metamaterials beyond electromagnetism* points out, the metamaterial concept also applies to thermodynamics and classical mechanics (including elastostatics, elastodynamics, acoustics, and fluid dynamics) [7]. Many related areas are envisaged to grow quickly as optical metamaterials and electromagnetic metamaterials evolve and flourish.There is no doubt that the tread towards the next stage of metamaterial development will be controllable metamaterial, on which smart structures and smart skin are built.Through the path, bullet trains and recreational vehicles (RVs) will obtain best signals, using these materials and technologies. In the future, metamaterial design will be more challenging than a cross -disciplinary approach and a multi-model on the proof-of- concept, product and device requirements. At the microwave frequencies (C microwave band, nominally 4.0 GHz to 8.0 GHz), the proposed electromagnetic metamarials willl function.

Metamaterials are novel synthetic materials that exhibits unique properties not found in nature. Metamaterial and metasurface does not comes under classical periodic structures i.e. photonic band gap structure (PBG) or frequency-selective-surfaces (FSS), rather than a particular class of metamaterial is characterized with double-negataive (DNG) materials. Such material exhibits property of negative permittivity and permeability in a given frequency band.

Originally, the surface vision of metamaterial is name as metafilm. So, metafilm is referred as metasurface, which is the surface distribution of large number of electrically small scatterers (e.g., metallic rings and rods, or spherical magneto-dielectric particles) [8]. The small scatterers can be arranged in a periodic manner throughout the region to obtain a bulk electromagnetic behaviour. It is not necessary that the constituent of metafilm i.e. the small scatters to be of zero thickness. Electric and magnetic polarizabilities define the behaviour of metafilm. Three-dimensional metamaterials can be extended by placing the scatterers in a two-dimensional arrangement over a surface. Figure 1 shows an arrangement of unit cells in a metascreen.

Metasurface is characterized with a cermet topology. It refers to an array of isolated scatterers called metafilms. Metascreen is the fishnet structure of metasurface. These are characterized with periodically spaced apertures relative to impenetrable surface.

For example, a grating of parallel conducting wires behaves like a metafilm in the direction perpendicular to the wires' axes, but like a metascreen in the direction along these axes.

Characteristics

a. Compact size
b. Low profile
c. Conformal

d. Multiband or broad-band
e. Low frequency
f. Low SAR

Advantages

i. It takes less physical space to do full 3-D structure and offer the possibility of reduced loss.
ii. Metamaterial will provide miniaturization of the antenna with desired frequency along with SAR reduction.
iii. A slab of DNG material, with flat faces, could act like a lens and would have a better performance than other diffraction-limited systems, such as a conventional convex lens made with a DPS material, for instance glass.
iv. The inductive and capacititve elements of both metasurface produces high transmission with variable phase characteristics.

Applications

The theory of metafilm produce some potential application which includes: (a) controllable "smart" surfaces, (b) miniaturized cavities, (c) new wave guiding structures, (d) switches, and (e) bio-medical devices.

The use of anisotropic scatterers to make up a metafilm can be used to achieve a number of useful results not possible with isotropic metasurfaces. One of the more interesting aspects of bulk metamaterials is the ability to engineer anisotropic behavior into them. In fact, this is the idea behind socalled “cloaking” materials, which has generated so much media interest. The cloaking concept is to design a specific anisotropic behavior into a metamaterial in such a way as to cause electromagnetic energy to propagate or bend around an object that is covered with it. If the anisotropic materials are correctly designed, the coated object will neither scatter nor absorb energy, and hence it appears to the electromagnetic (EM) fields as if the object is not present.

It controls the wavefront of EM waves by imparting local, gradient phase shift to the incoming waves, which leads to a generalization of the ancient laws of reflection and refraction. In this way metasurfaces can be made as a planar lens, vortex generator, beam deflector, axion and so on.

Metasurfaces can also find applications in electromagnetic absorbers, polarization converters and spectrum filters.

CONCLUSION

In academic research and the industry, we examined the development of metamaterial technology. Control and manipulation of electromagnetic, optic, and acoustic waves distinguishes metamaterials from traditional materials.Metamaterials should be able to change transmission, reflection, absorption, and steering beam direction, heat conduction control, and more with their tunability. Even without human intervention they wouldable to sense and react. Metamaterials have reshaped the science of matter. It is time we rethought their abilities.

ABSTRACT

Colonization of *Helicobacter pylori* in human gastric epithelial tissue and mucus membrane is associated with gastritis. There is also evidence that, it causes peptic ulcers, duodenal ulcers and chronic gastritis. In developing countries, prevalence of *H. pylori* infection is more than 90% and is about 50% infected adult cases in industrialized countries. Hence, array of new drugs development for the treatment of *H. pylori* infection is great concern. Urease is a key enzyme in *H. pylori* metabolism and virulence and it also plays a major role during colonization of this pathogen with gastric mucosa membrane. So, Urease may be a potential target for dug designing and vaccine development. In this study, we retrieved *H. pylori* urease structure from PDB and used it as a drug target protein. Phytochemicals have been used as drugs since ancestral time period. One of the potent phytochemicals of Bael (*Aegle marmelos)* is lupeol. Structure of the lupeol was retrieved from Pubchem and docking was performed by using Swissdock softwares. Swissdock is a web server specially designed to carrying out protein-ligand docking simulations. In our docking study, we found phytochemical lupeol from Bael is effective against urease enzyme of *H. pylori.* We also concluded that, in silico docking study is also a better approach to check the utility of any phytochemical as a drug than in –vivo and in-vitro study.

Key words: Phytochemical, Swissdock, Bael (*Aegle marmelos*), *Helicobacter pylori,* Lupeol, Urease

INTRODUCTION

Helicobacter pylori was formerly known *Campylobacter pylori* is associated with gastritis, peptic ulcers, duodenal ulcers and chronic gastritis. It colonizes gastric epithelial tissue ad mucus membrane. It has been also reported that, *H. pylori* is carcinogenic to human [1]. Combination of bismuth with antibiotics and proton-pump inhibitor with

antibiotics are most commonly used antimicrobial therapy against *H. pylori* infections [2]. Transmission of *H. pylori* occurs through the oral-oral and faecal-oral routes [3]. The most likely transmission route is person to person. It is a gram-negative, spiral shaped microaerophilic bacteria and optimal growth occurs in presence of 5-15% oxygen. Optimum pH range for growth of *Helicobacter pylori* is 4.5 to 9 and optimum temperature range is 30 to 37°C. Habitat for the growth of this bacteria is human stomach. It has been also isolated from domestic animals like cat [4]. Epidemiological studies have been proved that, transmission occurs through food and water. Consumption of uncooked vegetables that had been irrigated with water contaminated with untreated sewage was associated with *H. pylori* infection in Chile, South America etc. There are various lab diagnosis methods available for the detection of *Helicobacter pylori* infection. Among these diagnosis methods, detection of urease enzyme in infected person's stomach is a confirmatory test because *H. pylori* is the only organism that expresses urease. This urease enzyme helps in colonization of *H. pylori* with gastric mucosa of humans [5]. Urease (urea amidohydrolase: EC 3.5.1.5) catalyzes hydrolysis of urea to produce ammonia and carbamate, which subsequently produces ammonia and carbonic acid. It is a multisubunit metalloenzyme.

Bael (*Aegle marmelos)* is one of the most popular traditional medicinal plant in Indian origin. It is a spiritual, religious and medicinal plant found in Asian countries like Bangladesh, Indonesia, China, etc. It contains various phytochemical like alkaloid, tannins, essential oils, resins and gums etc. Following is the taxonomical classification of Bael (*Aegle marmelos)* [6]-

Taxonomy

Kingdom	:	Plantae
Order	:	Sapindales
Family	:	Rutaceae
Sub family	:	Aurantioideae
Genus	:	Aegle
Species	:	A. marmelos

Broad therapeutic application of Bael (*Aegle marmelos)* includes antidiarrheal, antifungal, antidiabetic, analgesic, anti-inflammatory, antipyretic, antimicrobial, antiulcer, antitubercular, antidandruff and antiviral activity etc [7,8]. Lupeol is one of the most active ingredients present in Bael. The other nutritional constituents present in Bael fruits are water, sugar, protein, fiber, fat, calcium, phosphorus, potassium, Iron and vitamins (Vit A, Vit B, Vit C and Riboflavin). The various polysaccharides present in Bael are galactose, arabinose, uronic acid etc. Carotenoids are chief pigments responsible for imparting pale yellow colour to fruit. Over the last few years, researchers are aimed to identify and validate phytochemicals for the treatment of many emerging diseases. These phytochemicals are easily available, cost effective and having less side effects than conventional drugs.

In this present study, molecular docking was performed by using Swissdock softwares. Docking is a method which predicts the preferred orientation of one molecule to a second when bound to each other to form a stable complex. Knowledge of the preferred orientation in turn may be used to predict the strength of association or binding affinity between two molecules. Docking is frequently used to predict the binding orientation of small molecule (ligand) drug candidates to their protein targets in order to in turn predict the affinity and activity of the small molecule [9, 10].

MATERIAL AND METHODS

Protein structure (PDB ID-3cxn) files of *Helicobacter pylori* urease was retrieved from PDB site containing resolution about 1.55A^0 and used as a drug target protein. Phytochemicals of Bael ((*Aegle marmelos)* lupeol structure was also retrieved from Pubchem. Docking study was performed by using Swissdock softwares. The value was obtained in terms ΔG Kcal/mol. Energy value is inversely proportional to the affinity of the molecule to be used as a drug. So,

lesser the (ΔG) of phytochemical molecule indicates higher affinity of that phytochemical as a drug. In online swissdock software, protein urease was browsed in it. The selected molecule (lupeol phytochemical) was docked at different sites of target urease protein. After completion of docking, the result was obtained at provided email ID. The result was analyzed at the link provided in the email. UCSF chimera was used to find the predicted binding modes.

RESULTS AND DISCUSSION

From this Swissdock molecular docking studies, we found good ΔG Kcal/mol value with lupeol. The ΔG Kcal/mol value was about -5.55. With Swissdock molecular docking system, the result was obtained in terms of full fitness. This lesser value of ΔG indicates, the successful approach of phytochemical lupeol from Bael (*Aegle marmelos)* as a drug against emerging carcinogenic pathogen *Helicobacter pylori* urease enzyme. Lupeol can be a potent phytochemical for the treatment of gastritis, peptic ulcers, duodenal ulcers and chronic gastritis.

CONCLUSION

This study suggest that, Lupeol, phytochemicals from Bael ((*Aegle marmelos)* can be used as a potent molecule against *Helicobacter pylori.* It can be used as a basic approach to design a drug against this emerging carcinogenic pathogen. Further in- vitro and in-vivo studies is required for the extension studies of this approach. Use of bioinformatics tool and computational biology for the drug design is a better approach to limit the time and cost that is required for the in-vitro and in-vivo drug designing studies.

ABSTRACT

Phytochemicals are non-nutritive compounds obtained from plants through primary or secondary metabolism.Wound healing is a complex process of recovering the forms and functions of injured tissues. The process is tightly regulated by multiple growth factors and cytokines released at the wound site. Any alterations that disrupt the healing processes would worsen the tissue damage and prolong repair process. Various conditions may contribute to impaired wound healing, including infections, underlying diseases and medications. Numerous studies on the potential of natural products with anti-inflammatory, antioxidant, antibacterial and pro-collagen synthesis properties as wound healing agents have been performed. Their medicinal properties can be contributed by the content of bioactive phytochemical constituents such as alkaloids, essential oils, flavonoids, tannins, saponins, and phenolic compounds in the natural products. The plant extract contains different phytochemicals. It has been reported that *Curcuma longa* plant extract is used to cure UTIs.Urinary tract infection (UTI) is a condition in which the urinary tract is infected with a pathogen causing inflammation which is a widespread, difficult and rarely life threatening condition. UTI is caused by *Pseudomonas aeruginosa.* Turmeric (*Curcuma longa*), a commonly used spice throughout the world, has been shown to exhibit anti-inflammatory, antimicrobial, antioxidant, and anti-neoplastic properties. The molecular docking of the phytochemicals with the enzyme was studied using Swissdock. In our docking study, we found phytochemical Aminopeptidase Nfrom Turmeric is effective againstAminopeptidase N enzyme of *E. coli.* We also concluded that, in silico docking study is also a better approach to check the utility of any phytochemical as a drug than in –vivo and in-vitro study.

Key words: phytochemical, Swissdock, *Curcuma longa*, *Escherichia coli*

INTRODUCTION

In former days, life was natural, steady, difficult at times but healthy. Now, in modern times, life is fast paced, comfortable, ready made, stressful and unhealthy. Changing work condition, environment, less physical activity, sedentary jobs, comfortable but stressful life and bad food habits has exposed us to some dangerous health problems like various infections, blood pressure, diabetes, obesity etc. A little caution, small changes in lifestyle and care if taken, we can prevent these lifestyle related diseases from increasing.Antimicrobial properties of medicinal plants are being increasingly reported from different parts of the world. Plants are very significant to human, because they have several dynamic constituents which are precursor to synthesize many drug. India has a rich flora that is widely distributed throughout the country. Herbal medicines are basis of treatment and cure variety of diseases. Plant based drugs were commonly used in India and China. This study examines effectiveness of Curcumin is a bio-active substance from turmeric. Owing to antimicrobial properties, its prospect as an antibacterial agent is currently under focus. The world health organization (WHO) has estimated that about 80% of the population living in the developing countries depends tremendously on traditional medicine for their primary health needs. More than half of the world's population still depends exclusively on medicinal plants, and plants offer the active ingredients of most traditional medical products (Kumar and Navaratnam, 2013).Pharmacological studies have shown that intake of fruits and vegetables as well as other plant products are helpful to diminish the risks associated with diseases. According to World Health Organization, medicinal plants would be the meritorious source in obtaining different types of drugs. More than 80% of individuals from developed countries depend on conventional medicines, whose components are derived from plants sources. This suggests that plants would be a source of immense potentials and could be investigated thoroughly for understand their therapeutic properties, safety and efficiency. Various medicinal plants have been used for years on a regularbasis to improve the life quality of people all around the world .[2]

India has a rich history of using plants for medicinal purposes. Turmeric (*Curcuma longa* L.) is a medicinal plant extensively used in Ayurveda, Unani and Siddha medicine as home remedy for various diseases.It is used as a main ingredient of cooking in Asian countries. Because of its yellow colour it is also employed as a dye. It has been widely investigated and found to have many applications. Important applications are in cancer, diabetes, asthma, anemia and intestinal disorders. In dermatology, it has wonderful wound healing activity. Furthermore, it improves skin complexion. It has antioxidant, anti-inflammatory, antiviral, antibacterial and antiseptic properties (Satoskar et al., 1986; Ramirez-Bosca et al., 1995; Khiljee et al., 2011)*C. longa L.*, botanically related to ginger belongs to the Zingiberaceae family. Broad therapeutic application of Turmeric(*Curcuma longa)* includes antidiarrheal, antifungal, antidiabetic, analgesic, anti-inflammatory, antipyretic, antimicrobial, antiulcer, antitubercular, antidandruff and antiviral activity etc.

Urinary tract infection (UTI) was mostly caused by Gram negative (GN) bacteria, predominately by *E.coli.* UTIs are among the most common bacterial infectious diseases encountered in clinical practice and account for significant morbidity and high medical costs. *Escherichia coli* is the most predominant pathogen causing 80 to 90% of community-acquired UTIs and more than 30% of nosocomially acquired UTIs. Recurrent UTIs (RUTIs) are reported in 16–25% of women within six months and in 40–50% of women within one year of an UTI episode, and thus pose a major clinical problem. We previously showed that up to 77% of RUTIs are caused by *E. coli* identical to the primary infecting *E. coli,* but characteristics of *E. coli.* associated with persistence or relapse of UTI remain poorly defined. *E. coli* can be separated in four phylogenetic groups (A, B1, B2 and D) that appear to have different ecological niches and propensity to cause disease. It is so far unknown whether there is an association between phylogenetic groups and *E. coli* causing RUTIs.

Pathogenic microorganisms can cause number of diseases by their harmful quality of invasiveness and toxic character. Synthetic antibiotics used against them can cause oxidative stress along with damage to the DNA, proteins and lipids in human cells, the consequences of which could be life threatening at times. Due to the presence of phytochemicals and antioxidants, plants can pave a way for development of antimicrobial drug[3] *E. coli* can invade

and replicate within the murine bladder forming biofilm-like intracellular bacterial communities (IBCs) and establish quiescent intracellular reservoirs that may represent stable reservoirs for RUTI. No antibiotics have proven efficient in eradicating the UPEC reservoirs in the bladder in mice. Exfoliated IBCs and filamentous *E. coli* have been detected in urine from women with acute uncomplicated cystitis indicating that this pathogenic pathway may occur in women with UTIs.

We performed docking study using software namely Swissdock and database PubChem for getting structures of chemical constituents. Computational Biology and bioinformatics have the potential not only of speeding up the drug discovery process thus reducing the costs, but also of changing the way drugs are designed. In the field of molecular modeling, docking is a method which predicts the preferred orientation of one molecule to a second when bound to each other to form a stable complex. Knowledge of the preferred orientation in turn may be used to predict the strength of association or binding affinity between two molecules. Docking is frequently used to predict the binding orientation of small molecule drug candidates to their protein targets in order to in turn predict the affinity and activity of the small molecule.

MATERIALS AND METHODS

Software used

Swissdock softwarewas used for analysis. The software utilizes molecular level machine learning techniques to predict the level of molecular interaction.

List of phytochemicals

Phytochemicals are produced by plants as secondary metabolites to protect them from predators. The potential threats to plants include bacteria, viruses, fungi etc. When these plants or their parts are consumed by humans these phytochemicals fight off threats to health. Some phytochemicals have been used as poisons and others as traditional medicine. Published works have reported *Curcuma longa* to contain Desmethoxycurcumin, flavonoids, terpenoids, tannis, bisDesmethoxycurcumin, phlobatannis, and coumarin etc. It has already been established that *Curcuma longa* plant belonging to family Zingiberaceae has potential to help controlling UTI. This work is focused on identification of the particular phytochemicals responsible for inhibiting and controlling of UTI.

It is reportedthat Turmeric contains many phytochemicals (secondary metabolites) like alkaloids, tannins, steroids, saponin, flavonoids and many others. Phytochemicals are the non-nutritive chemical constituents of plants which help to protect the plant for defence and prevent them from being infected by diseases. Apart from the defensive property these phytochemicals have on the plants, they also protect humans against variety of diseases.

Enzyme found in *E. coli*

It has been reported that UTI can cause as a result of *E. coli* infestation. Various metabolic cycles have been seen in the bacterial life cycle for its survival. These metabolic cycles are regulated by different enzymes. Brenda enzyme database was used to identify and list different enzymes found in *E. coli* bacteria. It has been found that Aminopeptidase N enzyme in complex with Beta Alanine (protein database code 4xn9) is involved in some metabolism and very crucial for survival of the particular microbe.

Molecular docking

Molecular docking method has been used to identify the phytochemical from the plant extract, that act as a ligand and form a strong covalent bond with the bacterial protein to successfully inhibit the microbe. The Swissdock software was used for identifying molecular interaction and perform molecular docking. In this process first the sdf

files for the phytochemicals found in the *Curcuma longa* plant were downloaded from the website (refer). The protein database code of the Aminopeptidase N enzyme was identified from the website (refer).

RESULTS AND DISCUSSION

From this Swissdock molecular docking studies, we found good ΔG Kcal/mol value with lupeol. The ΔG Kcal/mol value was about -7.77. With Swissdock molecular docking system, the result was obtained in terms of full fitness. This lesser value of ΔG indicates, the successful approach of phytochemical Bis-Desmethoxycurcumin from Turmeric(*Curcuma Longa)* as a drugagainst emerging carcinogenic pathogen *Escherichia coli*Aminopeptidase Nenzyme. Bis-Desmethoxycurcumin can be a potent phytochemical for the treatment of Urinary Tract Infections.

CONCLUSION

It was previously known that *Curcuma longa* plant has medicinal action against UTI. Mostly UTI is caused by *E. coli.*This study was carried out to provide the theoretical basis of this observation. Using Swissdock software, molecular docking operation was performed to identify the phytochemical(Desmethoxycurcumin, flavonoids, tannis, Bis-Desmethoxycurcumin, phlobatannis, and coumarin), which can have a significant interaction with the vital UTI of the microbe. It was found that Phlobatannis, Desmethoxycurcumin, coumarin, tannis and flavonoids can form strong bond with the enzyme successfully inhibiting the metabolic cycle of the microbe. Bis-Desmethoxycurcumin was found to be not much effective in deactivating the enzyme of the microbe. Terpinoids cannot deactivate the enzyme. Thus, this study could explain that the presence of Phlobatannis, Desmethoxycurcumin, Coumarin, tannis and flavonoids provided the medicinal values to *Curcuma longa* against UTI caused by*E. coli.*

This study suggest that, Bis-Demethoxycurcumin phytochemicals from Turmeric (*Curcuma longa)* can be used as a potent molecule against *Escherichia coli.* It can be used as a basic approach to design a drug against this emerging infectious pathogen. Further in- vitro and in-vivo studies is required for the extension studies of this approach. Use of bioinformatics tool and computational biology for the drug design is a better approach to limit the time and cost that is required for the in-vitro and in-vivo drug designing studies.

ABSTRACT

Streptococcus pyogenes (Group A Streptococcus or GAS) are widely prevalent bacterial pathogens worldwide. Human is the most common primary host of this pathogen. It causes wide range of diseases ranging from pharyngotonsillitis to potentially lethal invasive diseases such as necrotizing fasciitis and streptococcal toxic shock syndrome. Hence, development of new drugs against this pathogen is highly concern. Inosine Monophosphate Dehydrogenase (IMDH) is a key enzyme of *Streptococcus pyogenes* which catalyzes the conversion of inosine 5'-phosphate (IMP) to xanthosine 5'-phosphate (XMP), the first committed and rate-limiting step in the de novo synthesis of guanine nucleotides, and therefore plays an important role in the regulation of cell growth. So, IMDH may be a potential target for dug designing and vaccine development. In this study, we retrieved *S. pyogenes* structure from PDB and used it as a drug target protein. Phytochemicals have been used as drugs since ancestral time period. One of the potent phytochemicals of Tulsi (*Ocimum sanctum)* is Luteolin. Structure of the luteolin was retrieved from Pubchem and docking was performed by using Swissdock softwares. Swissdock is a web server specially designed to carrying out protein-ligand docking simulations. In our docking study, we found phytochemical luteolin of Tulsi is effective against Inosine Monophosphate Dehydrogenase enzyme of *S. pyogenes*. We also concluded that, in silico docking study is also a better approach to check the utility of any phytochemical as a drug than in –vivo and in-vitro study.

Key words: Phytochemical, Swissdock, Tulsi (*Ocimum sanctum*), *Streptococcus pyogenes*, luteolin, Inosine Monophosphate Dehydrogenase (IMDH)

INTRODUCTION

Streptococcus pyogenes is a major human-specific bacterial pathogen that causes various diseases ranging from mild localized infections to life-threatening invasive infections. *S. pyogenes* infection can result acute rheumatic fever, pharyngotonsillitis, necrotizing fasciitis and streptococcal toxic shock syndrome [1]. *S. pyogenes* is a gram-positive, facultative anaerobe, catalase-negative, oxidase negative, β-hemolytic streptococci. It grows best in 5 to 10% carbon dioxide, and forms distinct colonies on blood agar plates. Lancefield serological grouping system is used to differentiate group A streptococci (GAS) from other streptococci. The type A antigen of *S. pyogenes* is a polysaccharide which comprised of N-acetylglucosamine attached to a rhamnose polymer backbone [2]. M protein is the major surface protein presents on S. pyogenes cell wall. The class I S. pyogenes causes rheumatic fever and class II S. pyogenes causes glomerulonephritis. The mortality and morbidity rate due to Rheumatic Heart Disease (RHD) is high. Transmissions of *Streptococcus pyogenes* can occur through airborne droplets, hand contact with nasal discharge, surfaces contaminated with bacteria and skin contact with contaminated lesions etc [3]. The sign and symptoms of streptococcal infection includes Sore throat, fever, malaise, pharyngeal exudate, tender cervical lymphadenopathy and enlarged tonsils. The most effective treatment of streptococcal pharyngitis is oral penicillin which is a cost effective treatment also. Macrolides and first-generation cephalosporin can also be used as an alternative drug for treatment [4]. Inosine Monophosphate Dehydrogenase (IMDH) is a key enzyme of *Streptococcus pyogenes* (EC1.1.1.205) which catalyzes the conversion of inosine 5'-phosphate (IMP) to xanthosine 5'-phosphate (XMP), the first committed and rate-limiting step in the de novo synthesis of guanine nucleotides, and therefore plays an important role in the regulation of cell growth [5].

Tulsi (*Ocimum sanctum)* which is also known as holy basil is one of the extensively used medicinal plants in Ayurveda. It is having antioxidant, immune-modulatory, antipyretic, anticancer, chemo-preventive, radio-protective, anti-hypertensive and cardio protective and antimicrobial activity. Due to its widely known therapeutic value, it is most popular home remedy for Swasa (Asthma) and Kasa (Cough) in India [6]. Following is the taxonomical classification of Tulsi (*Ocimum sanctum).*

Taxonomy

Kingdom	:	Plantae
Class	:	Magnoliopsida
Order	:	Lamiales
Family	:	Lamiaceae
Genus	:	Ocimum

Preclinical studies have shown that, the most common active phytochemical of Tulsi includes eugenol, rosmarinic acid, apigenin, myretenal, luteolin, β-sitosterol, and carnosic acid etc [7, 8].

In this present study, molecular docking was performed by using Swissdock softwares. Docking is a method which predicts the preferred orientation of one molecule to a second when bound to each other to form a stable complex. Knowledge of the preferred orientation in turn may be used to predict the strength of association or binding affinity between two molecules. Docking is frequently used to predict the binding orientation of small molecule (ligand) drug candidates to their protein targets in order to in turn predict the affinity and activity of the small molecule [9, 10].

MATERIAL AND METHODS

Protein structure (PDB ID-1zfj) files of *Streptococcus pyogenes* Inosine Monophosphate Dehydrogenase (IMDH) was retrieved from PDB site containing resolution about 1.90A^0 and used as a drug target protein. Phytochemicals of Tulsi (*Ocimum sanctum)* luteolin structure was also retrieved from Pubchem. Docking study was performed by using Swissdock softwares. The value was obtained in terms ΔG Kcal/mol. Energy value is inversely proportional to the

affinity of the molecule to be used as a drug. So, lesser the (ΔG) of phytochemical molecule indicates higher affinity of that phytochemical as a drug. In online swissdock software, protein IMDH was browsed in it. The selected molecule (luteolin phytochemical) was docked at different sites of target IMDH protein. After completion of docking, the result was obtained at provided email ID. The result was analyzed at the link provided in the email. UCSF chimera was used to find the predicted binding modes.

RESULTS AND DISCUSSION

From this Swissdock molecular docking studies, we found good ΔG Kcal/mol value with luteolin. The ΔG Kcal/mol value was about -5.87. With Swissdock molecular docking system, the result was obtained in terms of full fitness. This lesser value of ΔG indicates the successful approach of phytochemical luteolin from Tulsi (*Ocimum sanctum)* as a drug against emerging carcinogenic pathogen *S.pyogenes* Inosine Monophosphate Dehydrogenase (IMDH) enzyme. Luteolin can be a potent phytochemical for the treatment of pharyngotonsillitis, necrotizing fasciitis, streptococcal toxic shock syndrome and Rheumatic Heart Disease (RHD).

CONCLUSION

This study suggest that, luteolin, phytochemicals from Tulsi (*Ocimum sanctum)* can be used as a potent molecule against *Streptococcus pyogenes.* It can be used as a basic approach to design a drug against this emerging carcinogenic pathogen. Further in- vitro and in-vivo studies is required for the extension studies of this approach. Use of bioinformatics tool and computational biology for the drug design is a better approach to limit the time and cost that is required for the in-vitro and in-vivo drug designing studies.

ABSTRACT

In the present review, Demonstration was done in case of modified gravity and generalised dark energy in a way that leads to the observed accelerated expansion. By adding a non-linear term to the lagrangian of the electromagnetic field generated a fluid with a super negative and time dependent equation of state. In case of the interaction of pressure less matter and dark energy; super accelerated expansions can be obtained. Correction to the apparent horizon entropy may force the universe to tend to a de sitter space time by obtaining ultimate value of Hubble parameter and dark energy density. Generalized chaplygin gas contains some of the key ingredients in the description of the universe dynamics.

Key words: Hubble parameters, density, dark energy and dark matter.

INTRODUCTION

The universe is presently undergoing an accelerated expansion. The main agent behind it is usually called 'Dark Energy'. Dark energy is an unknown form of energy that affects the universe on the largest scales. The negative bulk pressure is the main reason behind the dark energy to cause accelerated expansion. The coincidence problem arisen is the matter of worry and in every interpretation; our first aim is to alleviate it. In this review it is clear that by choosing appropriate candidate or model (such as HDE and time varying DE) the coincidence problem is removed successfully by obtaining an accelerated universe.

Dark energy cosmological model

CDM model does not imply the physical existence of dark energy. By dropping the assumption of CDM is a perfect fluid, the data can be fitted without dark energy. In case of imperfect CDM, negative bulk pressure might be the reason behind cosmic acceleration. We think that the two phenomena- accelerated expansion and structure formation in a large scale are linked. During the formation of in-homogeneities due to dissipative processes the

effective forces give rise to accelerated expansion of CDM universe.The assumption that CDM is a perfect fluid must be tested and the discrepancy may be resolved by taking into account the gravitating mass density.

In this work a Holographic Dark Energy Model was explored in a flat FLRW Universe, which contains cold dark matter and dark energy, baryons, radiations within the frame work of General Relativity. Three types of phenomenological interactions in the dark sector were considered. The algebraic expressions for the cosmological parameters such as the deceleration and coincidence parameters were obtained. Lastly, this model was compared graphically with the □CDM model.

To describe the accelerated expansion of the Universe in the present era, sources of matter (commonly dubbed to be dark energy), which are capable of generating this acceleration are considered. A cosmological constant □ is an important candidate for dark energy, which provides a good explanation for the current acceleration. But some problem arises such as, mismatch between the expected value of the vacuum energy density and the energy density of the cosmological constant and secondly the reason behind the same order of densities of dark energy and dark matter. As an alternative, dynamical dark energy models are proposed and analysed. Among them, Holographic Dark Energy Models, originated from the Holographic Principle, plays a vital role. By taking the current components of the Universe such as baryons, radiation, cold dark matter and Holographic dark energy; a theoretical model was developed; with interaction in the dark sector. The HDE model was compared graphically with □CDM, using the referential values for the HDE parameters and the given interactions. Using Bayesian statistics with the observational data (SNe Ia, CC, BAO, CMB) the present scenarios were expected to contrast in the near future.

Constraints on the interacting Holographic Dark Energy Model:- The interacting holographic dark energy model with spatial curvature was examined here. With requirement that the Universe is experiencing an accelerated expansion using the "near flatness" condition, they had constrained the parameter space of the model. The result found from this model can explain that the model can accommodate a transition of the dark energy from $\omega_D>-1$ to $\omega_D<-1$.

Various observational data indicates that our universe is undergoing an accelerated expansion driven by a yet unknown dark energy. The leading interpretation of such a Dark energy is a cosmological constant. But recent analysis of type Ia supernova data indicates that the time varying DE gives a better fit than a cosmological constant. Theoretical attempts towards understanding of the ω_D crossing -1 phenomenon have taken place. Investigation of the interaction between DE and DM in the holographic DE model has been done by using the future event horizon as an IR cut off which explain the early deceleration and late time acceleration of our universe.

Here they have obtained the parameter space of the coupling between DE and DM and the constant c from holography. To accommodate the transition of DE from $\omega_D>-1$ to $\omega_D<-1$, they have further constrained the parameter space on b^2 and c. Lastly they have obtained the results in a closed universe.

Poly-tropic dark matter flows illuminate dark energy and accelerated expansion

Poly-tropic processes in a DM fluid have been most successfully used in modelling dark galactic haloes which improves the velocity dispersion profiles of galaxies. Here the time evolution and the dynamical characteristics of a spatially flat cosmological model was explored. In this model the DM possesses some sort of fluid like properties i.e. the fundamental units of the Universe matter-energy content are the volume elements of a DM fluid, performing poly-tropic flows. As a source of the universal gravitational field, the energy of this fluid's internal motions are taken into account. The extra energy needed to compromise spatial flatness is compensated through this energy. This model depends on only one free parameter, the corresponding (poly-tropic) exponent, Γ. In this model, for $\Gamma\leq0.541$ without DE and cosmological constant, the conventional pressure becomes negative enough so that the Universe accelerates its expansion at cosmological red-shifts below a transition value. Finally this model interprets why and when the Universe transits from deceleration to acceleration. It reveals the catalytic role of the internal motions for the onset of acceleration.

Holographic dark energy and cosmic coincidence

A wide range of discussions are carried out to know the beginning of accelerated expansion, whether it is a transient episode or last forever, what is the agent behind it etc. The agent is usually called dark energy, which must possess a negative pressure high enough to violate the strong energy condition. There are a number of dark energy candidates such as cosmological constant and a variety of exotic field (scalar, tachyon, k-essence etc). Whatever may be the candidate it suffers the coincidence problem i.e. why are the matter and dark energy densities of precisely the same order? Now a new dark energy candidate based on the holographic principle was proposed. Earlier the shortcut to quantum gravity and it's application in cosmology and black hole growth was proposed. According to this principle, the number of degrees of freedom of physical systems scales with their bounding area rather than with their volume. Then a suggestion was given that dark energy should obey this principle and DE was constrained by the IR cut off. In line with this suggestion Hsu Li argued about dark energy density which leads to wrong equation of state but his 3rd choice, the identification of L with the radius of the future event horizon gives the desired result, namely a sufficiently negative equation of state to obtain an accelerated universe.

In this letter, they demonstrate that any interaction of pressure-less dark matter with holographic dark energy, whose IR cut off is set by the Hubble scale, implies a constant ratio of the energy densities of both components thus solving the coincidence problem. The equation of state parameter is obtained as a function of the interaction strength. For a variable degree of saturation of the holographic bound the energy density ratio becomes time dependent which is compatible with a transition from decelerated to accelerated expansion.

In the paper Dark Energy versus Modified Gravity There is now strong observational evidence that the expansion of the universe is accelerating. The cause behind this accelerated expansion is supposed to be an unknown " dark energy" component. To overcome the theoretical problems arisen, General relativity has to be modified in a way that leads to the observed accelerated expansion. Here they show by demonstrating explicitly that a generalised dark energy model can match the growth rate of the DGP model and reproduce the 3+1 dimensional metric perturbations.

In this letter they have shown that the growth factor is not sufficient to distinguish between modified gravity and generalised dark energy, even if the expansion history (and so the effective equation of state of the dark energy) has been fixed by observations. They have also demonstrated that in some cases (DGP) the dark energy can match the metric perturbations completely. If the expansion history and the growth of matter perturbations were to match those predicted from a physically motivated and self consistent modified gravity model, a statistical analysis would rule out a fine tuned dark energy model. In the paper, Non-linear electrodynamics and the acceleration of the universe it is shown that the addition of a non-linear term to the lagrangian of the electro-magnetic field generated a fluid with a super negative equation of state, causing an accelerated expansion of the universe. Some general properties of non-linear electro-magnetism is cosmology are also discussed.

Here they proposed a model which displays a time-dependent EOS, with a super-negative EOS parameter as a limit. Instead of using a negative kinetic energy term for a scalar field, they modified the action for the electro-magnetic field by the addition of a non-linear term which follows Gauge invariance. This modification is harmless in case of a point charge. The result of this modification in FRW cosmology is to accelerate the universe, ending in a Big Rip. More experiments are undergoing to reconstruct the EOS from observation. This reconstruction implies the measurement of the jerk (3rd derivative of the scale factor). The model they have analysed yields an EOS with a value [$\omega_{(-1)}$=-7/3]which is disfavoured by observation. In the paper Dual interacting cosmologies and late accelerated expansion they have shown that by considering a universe dominated by two interacting components a super accelerated expansion can be obtained from a decelerated one by applying a dual transformation that leaves the Einstein's Field equations invariant. They have considered a homogeneous, isotropic and spatially flat universe dominated by two fluids (pressure less matter and dark energy) that do not conserve separately but interact with each other. In this case there is a dual symmetry transformation that preserves the form of Einstein's equations irrespective of whether the dark energy is phantom or not. Super accelerated expansions can be obtained from decelerated one with out affecting the field equations also in the case that matter and dark energy interact. If the interaction term is $\Pi=-c^2(\varrho_1+\varrho_2)$ then the cosmic coincidence problem is alleviated in the sense that there is an

attractor such that the energy densities of matter and dark energy tend asymptotically to a fixed ratio neglecting the dark energy component to be phantom or not. The input parameter cannot be derived at present. In the paper Cosmic accelerated expansion and the entropy-corrected holographic dark energy they have studied the behavior of Hubble parameter in the holographic dark energy model by considering the logarithmic correction to the energy density.

They have considered a spatially flat FRW universe dominated by ECHDE and a barotopic matter interacting through a general source term. They have taken the apparent horizon as the IR cut off. Considering the effects of thermal fluctuations around equilibrium quantum fluctuations or charge and mass fluctuations, modifies the entropy attributed to the horizon. Applying these corrections to the apparent horizon entropy they obtained an autonomous differential equation for the Hubble parameter. After obtaining the critical points they have classified the behaviour of the system in terms of the parameters of the interaction and ECDHE. For this purpose they have used algebraic features of the autonomous differential equation and LambertW functions. They obtained that the correction terms may force the universe to tend to a de sitter space-time at late time. Also obtained the possible ultimate value of the Hubble parameter and also derived the corresponding dark energy density. The coincidence problem is also alleviated. In addition they have studied some necessary conditions for the model to describe the acceleration phase in inflation era. The inflation was assumed to be transient and the possible values of the Hubble parameter at the end of inflation were derived.

In the paper Generalized Chaplygin Gas, Accelerated Expansion and Dark Energy-Matter Unification they have considered the scenario emerging from the dynamics of a generalized d-brane in a (d+1, 1) space time. The generalization of the chaplygin EOS describing this system is given in terms of the energy density ϱ and pressure p by the relation $p = - A/\varrho^{\alpha}$, where A is a positive constant and $0<\alpha\leq1$. As in the case of the chaplygin gas (for $\alpha=1$) this model admits a d-brane connection as its Lagrangian density corresponds to the Born Infeld action plus some soft logarithmic corrections. Here the space time is shown to evolve from a phase that is initially dominated, in the absence of other degrees of freedom on the brane, by non-relativistic matter to a phase that is asymptotically De Sitter. This behaviour is similar to one of the Chaplygin gas. The intermediate regime in this model corresponds to a phase where the effective EOS is given by $p=\alpha\varrho$. They have estimated the fate of the in-homogeneities admitted in the model and shown that these evolve consistently with the observations as the density contrast they introduce is smaller than the one typical of CDM scenarios and closer to the ones predicted by the □CDM in comparison to the Chaplygin $\alpha=1$ case. Hence, the Chaplygin gas contains some of the key ingredients in the description of the Universe dynamics at early as well as late times.

CONCLUSION

Various observational data indicates that our universe is undergoing an accelerated expansion. A wide range of discussions are carried out to know the beginning of accelerated expansion; whether it is a transient episode or last forever; what is the agent behind it?. The agent is usually called 'Dark Energy' which must possess a negative bulk pressure high enough to violate the strong energy condition. There are a number of dark energy candidates such as □-cosmological constant and a variety of exotic field (scalar, tachyon, k-essence etc). Whatever may be the candidate it suffers the coincidence problem i.e. why the matter and dark energy densities are of precisely the same order? To overcome the coincidence problem or to alleviate it more suitable alternatives to cosmological constants were chosen such as time varying Dark Energy, Holographic dark energy etc. To overcome the theoretical problems, different models (CDM, □CDM, HDEM etc.) were considered and observations were taken. The results found were in-terms compared with the pre-existing ones. The different models and their results may be summarized as: A spatially flat cosmological model depending upon only one free parameter, poly-tropic exponent Γ was considered; where for $\Gamma\leq0.541$ without DE and cosmological constant, the conventional pressure becomes negative enough so that the universe accelerates its expansion at cosmological red shifts below a transition values.

ABSTRACT

In the present work,Density, Viscosity and ultrasonic velocity at a frequency of 4 MHz and in the temperature range 303–318 K are measured in some of the edible oils, namely Palmolein oil,Groundnut oil,Mustard oil,Sunflower oil.Various physical parameters such as relaxation time, acoustic impedance and Gibb's free energy of have been estimated using measured data on velocity viscosity and density. These values of relaxation time, acoustic impedance and Gibb's free energy and their variations with temperature in the systems of oils studied.Theultrasonic technique become very important to characterize the oils and fats.It is used as a versatile tool in study of internal structure and inherent properties of fats and oils, since it does not change the properties of the structure of materials.The variation of rheological and ultrasonic parameters in the oils are studied and reported in present paper.

Key words : Acoustical parameters, density, edibleoils and ultrasonic velocity.

INTRODUCTION

Ultrasonic liquids studies are of great use in understanding the nature and strength of the oil molecular interactions [1].This research is focused on illustrating the utility of the ultrasonic technique in composing different forms of edible oil. Theease, functionality and low cost of ultrasonic methods used to analyze them as vital components in laboratories of research.The edible oils contain both fatty acids and triglyceridesin their composition [2-4].Fatty acids are straight chain aliphatic compounds terminated with a group–CCOHand triglycerides arepropane esters 1, 2, 3-triol with threere sidues of fatty acid(fig 1 and fig2). Auto-oxidation produced during the storage and heatingis well known to be considered a primary cause of edible oil erosion [5]. The goal of the present work is to analyze some widely used edible oils experimentally,using an ultrasonic approach to gain an useful information into their dynamic properties.The relaxation time, acoustic impedance and Gibb's free energy are closely related to the physico-chemical

properties of the oils by which sound waves travel and can thus be focused on providing evidence on all these properties [6-7].

MATERIALS AND METHODS

Different standard edible oil like mustard, groundnut, palmolein & sunflower were collected from business units as samples to compare & investigate different characteristics & dynamic properties.

Due to their common market availability, the different types of edible oil, which are palmolein oil,groundnut oil,mustard oil,sunflower oil was chosen. It proves that consumer are interested in buying this type of edible oil on their daily basis as opposed to any other vegetables oil that is difficult to obtain from oils that are identified as vital nutrients for consumers. They provide the most focused energy source of any foodstuff, supply essential fatty acids and contribute significantly to the pleasure of cooking. The findings of this analysis showed the different types of edible oil are analyzed in four different regulated temperatures to determine the impact of temperature on the ultrasonic velocity values. Methods adopted are equivalent to in my earlier paper [8]

THEORETICAL ASPECT

The information of ultrasonic speed, ϱ, and η lead to the determination of different thermo-acoustical parameters, using standard equation.

Relaxation time $\tau = \frac{4}{3}.(\beta.$

Acoustic impedance $Z = \rho.U$

Gibb's free energy $\Delta G = 2.30.KT\log\left(\frac{KT\tau}{h}\right)$

Where, 'τ'is the relaxation time, Adiabatic compressibility 'β' 'T' is the absolute temperature, 'K' is the Boltzmann's constant and 'h' is the Planck's constant.

RESULTS AND DISCUSSIONS

The density(ϱ),viscosity(η) and velocity(U) of oil samples are reported in my earlier paper[].The Relaxation timeof oil samples is given in table 1 and variation between Relaxation timeand temperature is shown in fig.1.The Acoustic impedanceof oil samples is given in table 2 and variation between Acoustic impedanceand temperature is shown in fig.2. The Gibb's free energy of oil samples is given in table 3 and variation between Gibb's free energy and temperature is shown in fig.3. Relaxation time (τ) decreases slowly with increase in temperature in case of Palmolein oil and Groundnut oil, but decreases rapidly as temperature increases from 308 K for mustard oil and sunflower oil this is due to the presence of more percentage of saturated fatty acids in both Palmolein oil and Groundnut oil. With increase in temperature the presence of unsaturated percentage of fatty acids leads to decrease of relaxation time for Sunflower oil and mustard oil. The former indicates lack of strong molecular interaction between the components of the oils, and the latter is true because of instantaneous conversion of excitation energy to translational energy.

In the present system the values of acoustic impedance are less in Palmolein oil as the percentage of saturated and un saturated fatty acids are nearly equal and is more in the case of mustard oil and groundnut oil due to the more number of double bond. Where as in case of Sunflower oil more percentage of un-saturated fatty which is decreases the acoustic impedance rapidly by increasing the temperature which leads to less intermolecular interaction among the molecules. Gibbs' free energy decreases with increase in temperature of oils. Decreasing value of Gibbs function suggests that separation of like molecule is due to hydrogen bonding. The decrease in Gibb's free energy also suggests longer time for rearrangement of the molecules in the oils.Palmoleinand ground nut oil's Gibbs free energy gradually decrease at higher temperature. The Gibb's free energy for mustardoil and sunflower oil decreases at

higher temperature. It is due to depends on the percentage of saturated fatty acids and un- saturated fatty acids contained by the oils.

CONCLUSION

The report clearly shows that the ultrasonic parameters focus on the percentage of un-saturated fatty acids and saturated fatty acids that the different edible oil comprise. Edible oils are described in terms of their fatty acids,and its flow activity with temperature could be well characterized by ultrasonic technique. The chemical changes are related to the ultrasonic changes parameters such as relaxation time, acoustic impedance and Gibb's free energy may be used to define adulteration,track the consistency of the oil and thermal degradation in oils.

ACKNOWLEDGEMENTS

The author sincerely thanks Ajay Binaya Institute of Technology, Cuttack for their strategic help and encouragement.

ABSTRACT

Women must be aware about the health hazards and its impact in their life, including their own lifestyle and food habits – not least because it can lead to other life-changing decisions. If an adolescent girl does not get this education at her early age, it can lead to multiple complication in post marriage life. With enough awareness a girl can lead healthy life and a family too. For example, If a woman maintain minimum gap between giving birth to 2nd child, she can get enough nutritious food and take care herself and her children. Similarly,if an adolescent girl takes HPV vaccine, can reduce her chances of getting cervical cancer, averting illness and potentially catastrophic health expenditures in the future. The common health problems like; PCOS, HYPOTHYROIDISM, ALOPECIA AND MATERNITY are the great concern for girls at their adult stage.The research was made to know the awareness level on health issues and it'spreventive measures among the rural girls followed by a health awareness programme for healthy life.

Key words: Healthcare, HPV Vaccine, PCOS, Hypothyroidism, Alopecia and Maternity

INTRODUCTION

Adolescence is a beautiful length of life and generally a healthful one. Childhood illnesses are left at the back of and with a little care one can build up a lifetime of properly health. But this is additionally a duration when a individual is most vulnerable; the standard growth and improvement and additionally the physical, reproductive and psychological modifications expose the teenagers to many health risks. Careful and unobtrusive attention to every thing of fitness at this stage will assist will assist young people develop into wholesome and responsible adults. One of the most common heath concerns amongst adolescent ladies in our us is undernutrition and anemia. One third of the adolescent women in India are underweight and as per the NFHS three data, fiftysix p.c are anemic. Poor nutrition, worm infestations and menstrual abnormalities, both menorrhagia and,polymenorrhea make a contribution to this without problems preventable condition. Many of these girls are born with deficient iron stores due to the fact their moms were anemic in the course of pregnancy.

Poorcognitive functions and widespread ill health affect their conceivable to attain the best in studies and other activi ties. Although iron supplementation is recommended for adolescent girls, it is healthier to enhance their standard eating regimen as these women have diets deficient in calories, proteins and other crucial nutrients. Good food plan is quint essential for applicable boom and improvement of adolescents, for boosting their immunity and stopping conditions like anemia. Vitamin D and calcium in weight-reduction plan and weight bearing workouts construct up the bone mass in this age. Peak bone mass is achieved via about 30 years of age and begins declining thereafter. A low peak bone mass is an vital threat issue for osteoporosis later. Malnourishment and weight problems regularly seen in prosperous teenagers can additionally predispose them to fitness problems like polycystic ovary and metabolic syndrome. Emphasizing the importance of a well balanced healthy weight-reduction plan and enough physical endeavor at this age can go a lengthy way in ensuring properly health later.

Reproductive fitness issues of adolescent girls additionally need to be addressed. Many myths encompass the regular menstruation. Educating them about this physiological situationallows them to cope up with many of the troubles and lets in them normal things to do with no restrictions in the course of menstruation. Irregular and infreq ent cycles are frequently viewed for a few years after menarche and don't want any intervention. Irregular cycles with obesity, hirsutism may be due to polycystic ovarian sickness but need to be investigated to rule out different reasons of hyperandrogenism like congenital adrenal hyperplasia or ovarian tumor. Heavy menstrual bleeding requires complete comparison such as hemoglobin estimation and coagulation profile as some congenital coagulation issues may appear as puberty menorrhagia. Dysmenorrhea, if serve additionally wants to be investigated thugh mild dysmenorrhea can effortlessly be managed with simple analgesics. In adolescents with amenorrhea, menorrhagia or extreme dysmenorrhea, pelvic ultrasound may additionally be required to rule out any pathology. Proper and timely administration of any pathology so detected helps restoration the health of the young people.

Maintenance of right hygiene especially during menstruation is important. Poor menstrual hygiene and early sexual exposure can lead to reproductive tract infections with lengthy term morbidities. Sexually transmitted infections may additionally persist as chronic or recurrent infections and might also lead to pelvic inflammatory sickness involving cervix, uterus, fallopian tubes and ovaries. Tubal contamination can also lead to tubal bloakage and infertility later. Vaginal and cervical epithelium is immature in this age and is more inclined to infections. Human Papilloma Virus (HPV) contamination obtained at this age may later lead to premalignant or malignant adjustments in the cervix. Early unprotected sexual pastime exposes them to the hazard of HIV infection also. Teenage pregnancies may additionally adversely affect the health of the lady and can also have long time period penalties specifically if risky abortions are resorted to. Health education together with sex training must be handy to all youth whether they attend the college or not.

REVIEW OF LITERATURE

Women's fitness includes a large range of focal point areas, such as: Birth control, sexually transmitted infections (STIs), and gynecology. Breast cancer, ovarian cancer, and other lady cancers. Other ailments are like PCOS, HYPOTHYROIDISM, ALOPECIA AND MATERNITY problems. Polycystic ovary syndrome (PCOS) is a condition that influences a woman's hormone levels. Women with PCOS produce higher-than-normal quantities of male hormones. This hormone imbalance reasons them to ignore menstrual periods and makes it harder for them to get pregnant. PCOS additionally causes hair increase on the face and body, and baldness. And it can contribute to long-term fitness troubles like diabetes and coronary heart disease. Birth manage drugs and diabetes pills can help restore the hormone imbalance and enhance symptoms. PCOS is a problem with hormones that impacts female at some stage in their childbearing years (ages 15 to 44). Between 2.2 and 26.7 percent of ladies in this age group have PCOS (1, 2Trusted Source).Many ladies have PCOS but don't comprehend it. Hair loss, additionally recognised as alopecia or baldness, refers to a loss of hair from phase of the head or body. In the majority of cases, hair falls out in small patches round the dimension of a quarter. For most people, the hair loss is

nothing greater than a few patches, although in some instances it can be greater extreme. Hypothyroidism is when the thyroid gland does now not produce adequate thyroid hormones to meet the wants of the body. The thyroid is underactive. The contrary is hyperthyroidism, where the thyroid produces too a good deal thyroid hormone.

Research Objective

- Study the awareness level of girls about health issues and the it's preventive measures
- Creating awareness among girls regarding different health hazards.

Research Design

The data was collected from both primary and secondary study. It was a quantitative research with a sample size of 60. The research was done by interview methodsthrough a questionnaire. The awareness campaign was conducted to find post training response from same sample to measure their level of awareness.

RESULT ANALYSIS

The study was made to know the level awareness on preventive measure and health issues before and after the awareness programme was organised

Healthy diet and through exercise you can control PCOS

Before the training program 83% of girls had idea about this but after the training 95% of girls got the knowledge of this cure.

Acupuncture is an alternative treatment for PCOS

Only 33% of girls knew that acupuncture is an alternate for PCOS but after the program 85% of girls got the idea about it.

Rubbing green tea into your hair will help in preventing hair fall

Only 58% of girls knew that rubbing green tea is helpful for preventing hair loss but after the training 89% of girls got the knowledge.

Walk, swim or bike for 30 minutes a day helps balance hormonal levels, reducing stress levels besides reducing hair fall

Before the program only 45% of girls are aware of the fact that swim, bike or walk for 30mins for a day helps in reducing the stress level but after the programme it becomes 79%.

Only 89% of girls were knew that applying crude onion juice helps in reducing the hair loss but after the training programme 97% of girls got the idea.

Food having high selenium, zinc and vitamin-B helps in curing Thyroid

Before the programme only 89% of girls were aware of it but after the training 97% of girls got the knowledge that food with high selenium, zinc and vitamin-B helps in curing Thyroid.

Constipation and dry skin are the symptoms of Hypothyroidism

Only 49% of girls knew that the constipation and dry skin are the symptoms of Hypothyroidism but after the training programme 87% of girls got the idea.

Untreated Thyroid causes problem during pregnancy

Before the training session only 38% of girls knew about the fact that untreated Thyroid causes problem during pregnancy but after the training 91% of girls got the knowledge.

Late marriage causes pregnancy problems

58% of girls had the idea that late marriage cause pregnancy problems where as after the training session 88% of girls got the idea about it.

Abortion creates problems for conceiving in future

83% of girls already had the knowledge of abortion which creates problems for conceiving in future but after the programme 98% of girls got clear about it.

Getting pregnant in a late age increases the chances of having a baby with birth defect

Before the programme 58% of girls only knew that late age pregnancy creates the chances of having baby with a birth defect but after the programme 94% of girls got the knowledge.

CONCLUSION

The past few decades have seen impressive advances in women's health, including their sexual and reproductive health and rights. At this critical juncture, we must do all that we can to ensure that we continue to move forwards, not backwards. WHO is resolutely committed to playing its part by providing the standards and scientific evidence that underpins advances in women's and girls' health, data and estimates on the scale of the challenges, and innovative ideas on how to overcome them. Hence it is essential to have clear policy and programme designed to create awareness about health issues of girls at school level to protect them from serious complication in future and make a healthy society.

ABSTRACT

The value based Education, job skill and active learning are basic elementsto sustain and continue to performbya person in today context. It improves the employability conditions and the quality of life, and contribute to social and business development. Acquiring required industry Skills and upgrading with the changing environment are the basis for the competitiveness of economies and enterprises. From a social perspective, this is a tool to eradicate poverty, giving right opportunity for the marginalised under privileged youth of the society.India is fastest developing country in the world with over 50% of the population under 30 years. It is estimated, India will have the 25% of the total global workforce (World Competitiveness Yearbook, 2012)by about 2025. Hence, there is a need to have well framed policy to develop and empower the human capital and for nation's global competiveness.The research was conducted in Retail and Hospitality (R & H) training offered by GTET, one of the leading skill training centre in Bhubaneswar, Odisha, in collaboration with CCD. This skill training has created employment opportunity for young boys and girls, mobilised from rural area and then subsequently moved to work in metros of India. This training has changed their Lifestyle and also given opportunity to grow to the level of Managers in Retail and Hospitality industries. The research was made to understand the impact of skill training in creating employment opportunity for 10th/+2 pass youth with a scope to pursue graduate degree in Retail and Hospitality(BBA) while working at CCD outlet. The research aims at finding the impact of skill training in Retail and Hospitality for youth of Odisha. The study reveals that skill training has not only created employment opportunity for school dropout but also shown them a path to grow professionally in acquiring higher education while earning.

Key Words: Skill development, Retail and Hospitality, Gram Tarang, Caffey Coffey Day

INTRODUCTION

India with larger populations of youth have both positive and negative aspect in terms growth of the country. The current education systems do not facilitate to provide necessary skill and competency that can help a youth to serve in an industry or to start own enterprise. Therefore, the Govt. of India started Skill India mission to provide necessary hands-on skill for school dropout to make them industry ready. This skill training also provides ample opportunity to set up small and medium enterprise, enabling additional employment opportunity for youth. Retail and hospital Industry are key player in India today in adding value to the GDP of the country. This has also created a large employment in private sectors for school dropout up to a professionally qualified graduate.

Gram Tarang Employability Training(GTET) is the largest skill training provider in India in various fields with a strong partnership with Industry. GTET has created workshops that are well equipped with machine/equipment of industry standards and a strong curriculum recommended by industry. Retail and Hospitality is one of the most successful skill training programme offered by GTET in collaboration with Cafe Coffee. The training is offered for 3 months duration followed by 9 months on job training with stipend in any retail outlet of CCD. Since the trainees have to deal with different profile of customers, The training module has integrated a life skill training programme to take care of soft skill of all trainees along with technical training that requires for a Brew Master to make coffee and serve.After successful completion of training they get placed in retail outlet of CCD. GTET also has tie-up with Centurion University to offer BBA in Retail and Hospitality to these training post placements that create path for them to get promotion and higher growth.

The success of skill training largely depends on success story of these youth that spreads in their village, taluk and district. It helps skill training providers to mobilise these youths who normally are very reluctant to move out from their location to urban. Many such youth would be there to travel 1st time in a train to urban city and stay away from their family and relatives. Hence there is a need for training providers to make an impact assessment of skill training in achieving the very cause of Skill Indian mission and economic prosperity of unemployed youth at large.

National Skill Development Corporation Initiative in India

As per NSDC vision, the present the capacity of skill development in India is around 3.1 million persons per year. India can move to 15 million annually. Government of India has target of creating 500 million skilled workers by 2022. Thus, there is a need for increasing capacity and capability of skill development programs.The skill development initiatives will harness inclusivity and reduce the economic and social boundary such as gender, rural/urban, organized/unorganized employment and traditional/contemporary workplace.The skill development mission support the industryin creating skilled workers who are flexible to the changing demands of industry. This strategy will promote excellence and can meet the requirements of knowledge economy.

The skill development initiative not only created employable skilled worker but also shown a path to be self-employed through own start up. The skill development initiatives support employment generation, economic growth and social development processes. Skill development policy will be an integral part of comprehensive economic, labour and social policies and programmes.

Governance of skill Development Initiative

The Ministry of Skill Development and Entrepreneurship is driving skill India mission through NSDC, which has further created 38 Sector Skill Council(SSC) to develop industry specific curriculum for skill training. SSC determine skills/competency standards and qualifications and getting them notified as per NSQF. It does standardization of affiliation, accreditation, examination and certification process in accordance with NSQF as determined by NSQC. It also conducts skill-based assessment and certification for QP /NOS aligned training programmes. It funds it's training partners to run skill training programme under various schemes viz; PMKVY, DDU KY etc.

LITERATURE REVIEW

The literature review has enabled the researcher to explore wider scheme of skill training related to specific job skill. It has helped the researchers to understand the current knowledge in the field of skill training. The study highlights the impact of skill training in creating employable youth, without having formal educational degree, through research done by other researchers. It has given insights on training prospects, benefits and challenges in skilling India, skill development in creating employment and research gaps to be filled by further research

Gupta and Agarwal (2018), conducted a study on "Training Prospects in Power Sector in India". The objective of the study was to identify training need in the power sector. It also tried to find the type and level of skill trainings offered and the kind of, the organization involved in imparting such trainings. The study covers public and private players involved in imparting such training in power sector. The study found that training programs conducted for every level of jobs through various modes like short term, long term, and workshop, graduate and post-graduate programs in power sector. Theefforts are being made to re-skill the prevailing workforce and updating them with the new avenues available and approaching into the arena. Still there's a gap between the kind of skill manpower required vs. the manpower available to serve this sector. This sector can absorb large no. of skilled manpower in the field of Service, maintenance, installation, repair work and also in manufacturing. The sector skill council has already floating some skill training programme that helps in creating skilled manpower for power sector.

Shrivastav and Jatav (2017),conducted a study entitled "An Analysis of Benefits and Challenges of Skilling India" The aim of the study was to check the prospects and challenges for skilling in India. The Researcher tried to analyse the challenges and ability for creating an eco-system in terms of economic resources and sustainable knowledge has been gathered from the secondary sources for the study. The study discovered varieties of skill training offered by NSDC to generate job opportunities in line with job skill identified by industry. The study found the resource capability, the gap and initiatives taken by specific sector skill council and it's training partners. The training organisation are in need of industry standard labs/workshops to provide hands-on experience to make all trainees market ready.

It is evident that there is lot efforts are being made at various level with focused attempt and support by Govt. of India to create employable manpower to serve industry as well as to be self employed irrespective of having or not the basic formal degree. Employment generation is the one issue other than that employability and productivity is another issue. Currently about 26 million youth are getting into a age group for employment every year with about 65% of them looking for jobs. Age and formal education degree is a constraint that affecting for skills development, because of social stigma. Good news is that today, there is no bar in gender for acquiring specific skill for their employment. To make "Make in India" project successful, youth of the nation should be empowered with formal education, technical and vocational training to meet the Industrial requirement as per global standards.

Research Gap

The skill training programme has a long term social benefits in creating employment through skill training. It is essential for all stake holders to have wider prospect of knowledge and feedback on the entire training activity;

- The quality of training programme and activity undertaken in supply chain; starting from mobilisation to post placement support
- The experience and Success story of trainees,
- Trainer's experience
- Employer views.

Research Objectives

Based on need and importance of skill training in our country the researcher tries to find insights that would help all stake holders to take appropriate action as deemed fit.

- To understand the supply chain of skill training services delivered by training organisation

- To highlight experience of trainees and their success story
- To make an impact assessment of the skill training in Retail and Hospitality
- To suggest scope for improvement in training by training providers, funding agency and future participants

Research Design

The research is more qualitative and exploratory in nature.Researcher has administered a structured questionnaire to get specific data with reference to Research Objectives. The data received was compiled and presented in the form of graph/chart supported with data table.

RESEARCH METHODOLOGY

This research is explorative in nature. The researcher has studied the training Programmes and its impact on creating Employment and Self Employment of youths. The Study is in reference to Retail and Hospitality skill training only. Research methodology is divided into five sections i.e. Section I contains Data Sources, Section II analysis of data collected from trainees.

Data Sources and Data Collection

The data required for the study was collected from primary sources on multistage random sampling method from trainees through a structured questionnaire and face to face interview. The secondary sources include books, journals, handbooks, newspapers, circulars, bulletins, working papers, reports, websites and Government departments.

RESULT AND DISCUSSION

The analysis and interpretation of the various opinions given by the various respondents which were collected from the trainees are shown in the form of tables below.

Analysis and Interpretation

- The trainees were asked to respond on the reason for choosing this training programme based on specific criteria. It was found that 95% students have joined this training to get job in an industry.
- Data table; Reason for joining L&H training programme
- One of the key challenge for training organisation to mobilising youth for skill training and equally for trainees to know about such training programme and join. The trainees were asked to respond on knowing about this training.
- Data table; Reason for joining L&H training programme
- The trainees were also asked about the alternative ways to earn for their livelihood, in case non availability of such skill training
- The survey was conducted to capture the trainee experience at training organisation. It was on training and training facility available for them to rate in scale of Excellent, Good, Satisfactory and Poor.
- Data table Experience of trainees at training organisation
- The researcher tried to find more specific input on teaching input, level of skill acquired and their confidence of getting suitable employment after successful completion of this training.
- Data table; Level of industry skill acquired by trainees
- The opinion of trainees was collected on scope of improving R & H training programme and creating awareness about this for rural youth to enrolled.

SUMMARY AND CONCLUSIONS

The current study reveals that skill training in Retail and Hospitality has been a successful model to provide industry practice input, due to strong collaboration of Industry in creating training module, training materials, machine and equipment, raw materials, qualified trainer and required infrastructure. The quality of training has been endorsed by employer by giving 100% placements support. The training has made an impact in giving all round development of trainees both in technical and soft skill. The Life Skill training programme has adequately improved speaking skill in English, the art of dealing customers at retail outlet, managing the retail store. Apart from this, the trainees have the opportunity to get additional degree in BBA-Retail and Hospitality, which has made them eligible to get promotion in the organisation the level of Managers and above. It also gives a wider opportunity to serve any other Retail or Hospitality organisation. There has been few success story of trainees who have participated in various level of Brew master training and own recognition.The research was limited to trainees' experience only during training programme. The research can further be extended to take feedback from employers, parents and Alumni to have a holistic view on success of skill training in Retail and Hospitality.

Considering the need for creating employable human capital it is essential to bring a reform in formal education viz; integrating vocational courses at school level for kids to explore and many of them may not be good at studies but very good in hands-on skill. There has to be proper counselling about the career scope based on one's academic performance and passion. Similarly, it is also essential to identify skill that can be integrated at higher education level and students are given choice to pursue as elective or specialisation, which is dynamic in nature that coupled with technology and practice.

ABSTRACT

India is the 2nd largest population in the world with 70% of the population lives in Rural area. About 27% are from the age group of 0-14 and about 18% are from 15-24 age group. (India Demographics Profile 2019; index mundi). The youth dependency ratio is about 43.6%. The school dropout ratio is quite high in case of female child for various reason and hence they do not find suitable employment opportunity, more specifically in rural sector to earl livelihood. The skill India mission under "Apparel Made-Ups and Home Furnishing Sector Skill Council" under NSDC is doing extremely well in skilling eco systems in training and employing female youth(largely) to get employed in Apparel, Made-Ups and Home Furnishing sectors. The researches has done a study of Apparel training provided by one of the largest training partner in Odisha. It has tried to understand the training eco-system, facility available, experience of trainees and their journey from rural to urban location. It has also tried to capture some experience in terms training quality, employment opportunity and their social and economic changes.

Key terms : Skill, Sector Skill Council, Apparel, Made-Ups and Home Furnishing, NSDC

INTRODUCTION

Apparel, Made-Ups and Home Furnishing Sector Skill Council (AMH SSC) has been launched with a primary mandate of enhancing and to build a capacity in skill development. One of the salient features of the AMH SSC is designing of the training programmes, based on industry demands of different segments and to ensure that all successful trainees are certified through accredited assessment agency.

The AMH SSC was incorporated "To Develop a skills repository for the Apparel, Made-Ups and Home Furnishings value chain, To build an organization that can develop Standards, evaluation criterion and accreditation systems for providing multiple and varied technical skills in the textile sector including employ ability skills to both men and women, as well as challenged persons with regular and direct inputs from industry, Create opportunities for

"Training of Trainers "in both the content and pedagogy for imparting skill training for all workers engaged in the three chosen segments of the textile sector, Quality Assurance-Develop and promote a standardized, output oriented and quality assured affiliation and accreditation process and demonstrate sustainable business value through it, Focus on continuous improvisation of the training delivery value chain, i.e. training process, training content, trainers, curriculum design, industry endorsement for certification etc., Partner with training providers and guide them into becoming centre so excellence and innovation by utilizing the standardization in training, evaluation and certification developed by the SSC of the sector. Integration of Technology in Training, Development of a sector skill development plan and maintain skill inventory, Promotion of Resource Support Agency (academies of excellence), Establishment of a well-structured sector specific Labour Market Information System (LMIS) to assist planning and delivery of training."

India suffers from a large school dropout cases in women, particularly in rural India due to poverty, social stigma, inaccessibility to higher education, early marriage and engaging household work. This creates dependency of women in the society and leads to very poor quality of life. It has been experienced from ancient days that women get into some economic activity in design, fabric painting, stitching, making product from waste materials etc. and earn a little money to run the family. In order to provide employment opportunity, the organized skill training has immensely helped them to earn and lead a better livelihood. The skill training in Apparel, Made-Ups and Home Furnishings has given a wider prospect for job and self-employment.

LITERATURE REVIEW

The apparel manufacturer is responsible for all production activities, including the Cut, Make, and TrimCMT activities, as well as finishing. The firm must have upstream logistics capabilities, including trained manpower to run the production. This is a business model that focuses on adding design capabilities to the production of garments and precision manufacturing in volume production of same design. The industry is in need of skilled manpower to work in shifts and sometimes overtime in case of seasonal products. Most of the industry employs women worker that suits the nature of job. The Apparel industry suffers from high attrition due to migrated women workforce coming from rural area to work in apparel industry. But the industry absorbs large no. of women worker in turn empowering women of India.

Prasad and Purohit (2017), conducted a study on "Skill Development, Employability and Entrepreneurship through Make in India: A Study". The objectives of the study were to understand the success of Make in India movement on employability aspect through review of literature. The study is an exploratory research based on the secondary data and information collected from libraries, relevant books, journals, magazines, articles, media reports and Government portals of Make in India, Skill India, etc. The researcher adopted greater accuracy and in depth analysis of the research study based on available secondary data. The study gave an overall insights on status of skilling capability available and the skill gap and initiatives taken by Government of India to create an impact in producing skilled manpower and "make in India" project successful. The youth should be empowered with Technical and Vocational training along with Formal Education, to meet the Industrial manpower requirement. Despite various efforts and investments in shaping the skills of a huge labor force there are long way to go in achieving this mission and make it inclusive of our education systems. As a fast growing developing economy, apart from white and blue collar jobs, India also needs Grey collar- knowledge workers, with digitally aligned, innovation in solving social problems at the grass root level to support sectors like construction, agriculture and related trade. It is recommended to introduce vocational training as a part of School education. There is a great need for proper counselling to students at school level to decide their career based on academic standard and passion. Life skills training should be blended with technical skills to make youth more independent and accommodative to ever changing technology.

Ansari and Khan (2018), conducted a study on "Role of Education and Skill Development to Promote Employment in India". The objectives of the study were to analyse the status of current education with respect to skill development

and suggest based on the observations and analysis of the study. The study was based on secondary data collected from published reports, surveys, books, prominent sites, media reports etc. It is concluded that to sum up skill development for India is critical from both the socio-economic and demographic points of view. However, skill training is the important tool for reducing poverty, enhancing competitiveness and employability and to promote the self-entrepreneurship among youths. Now it is time to continuously examine the kind of skill training delivered and the need for changes/addition of new skill training in line with fast changing technology adoption in all sectors. To be more précised we need to move further into a knowledge-based economy, to promote industrial development and to achieve high economic growth, which requires huge investment in education and training for youth with a proper balance between them.

It is evident that there is lot efforts are being made at various level with focused attempt and support by Govt. of India to create employable women workforce to serve industry as well as to be self-employed irrespective of having or not the basic formal degree. Employment generation is the one issue other than that employability and productivity is another issue. Good news is that today, training in Apparel, Made-Ups and Home Furnishings has largely contributed in achieving "Make in India" mission too.

Research Gap

The skill training programme has a long term social benefits in creating employment through skill training. It is essential for all stake holders to have wider prospect of knowledge and feedback on the entire training activity;

- The quality of training programme
- Sustainability of this training in terms of pursuing same career
- Trainer's experience
- Employer views.

Research Objectives

Based on need and importance of skill training in our country the researcher tries to find insights that would help all stake holders to take appropriate action as deemed fit.

- Understand the logistics of Apparel skill training
- Highlight experience of women trainees faced during training and post job
- Make an impact assessment of the skill training in Apparel
- Suggest scope for improvement in training by training providers, funding agency and future participants

Research Design

The research is more qualitative and exploratory in nature. Researcher has administered a structured questionnaire to get specific data with reference to Research Objectives. The data received was compiled and presented in the form of graph/chart supported with data table.

RESEARCH METHODOLOGY

This research is explorative in nature. The researcher has studied the training Programmes and its impact on creating Employment and Self Employment of youths. The Study is in reference to Apparel skill training only. Research methodology is divided into five sections i.e. Section I contains Data Sources, Section II analysis of data collected from trainees.

Data Sources and Data Collection

The data required for the study was collected from primary sources on multistage random sampling method from trainees through a structured questionnaire and face to face interview. The secondary sources include journals, reports, websites and Government departments.

RESULT AND DISCUSSION

The analysis and interpretation of the various opinions given by the various respondents which were collected from the trainees are shown in the form of tables below.

Analysis and Interpretation

- The trainees were asked to respond on the reason for choosing Apparel training programme based on specific criteria.
- It was found that57% women join apparel training to get job. 23% of trainees are interested for self-employment, 9% for not havingopportunity to go for higher education.4% have an interest in apparel design and stitching and 7% due to their family pressure.
- A study was made to understand the mobilization process to identify and bring them to training organization. Each training organization follows different channel to create awareness about the training in rural area and get family support to leave them to join training and work in city.
- The study says 37% are influenced by their friends and equal % join out of their own interest. 12% get to know from media and 9% from local publicity. 5% join due to their family pressure to earn and support their family.
- The study was made know other opportunity for women, if they would have not joined apparel training programme.
- The study says, 32% of them would have done small traditional economic activity in producing and selling local products.34% of them would have joined higher studies and rest have no idea.
- The study was also made know trainees' experience in getting quality training which would make them for getting job or self-employed. The responses were taken regarding Over all Training quality, Training support,Training Design, Theoretical input, hands-on practice, classroom training, Training equipment/machine and Life skill training in the scale of Excellent, Good, Satisfactory and Poor. Almost 90% feedback was excellent and good. The trainees also appreciated the life skill training on digital technology, sanitization, etiquettes, working and living together, which was value added training for all skill trainees
- A study was made to understand the mindset of women on choosing and improving apparel training. 47% of trainees insisted on counseling their parents to allow them for this training, 28% for counselling to the candidates which indicates that the success of training lies on the attitude and motivation of parents as well as women candidate to leave their house and come to city for employment.
- A survey was made to find the aspiration of trainees post training. 72% of trainees are interested for job where as 28% want to go back to their native place and start tailoring shop and live with their family.

DISCUSSION AND CONCLUSION

The researcher found that Apparel training is one of the training opportunity for women to either go for job or to be self-employed. The training institute has given 100% placement opportunity for all women trainees after successful completion of 3 months training. The trainees are always asked to make uniform for their juniors at the end of training, which is pre-qualifying test for them to go for job in industry. The life skill training has largely helped them in understanding the industry environment of working and living together in working hostel. They are also made digitally savvy in operating smart phone to use apps for transferring money. They are trained on basic etiquettes, dressing sense, personal health care and safety.

It is evident that the Apparel, Made-Ups and Home Furnishings training has a greater impact in empowering women, be financially independent and for better livelihood. This is also supporting apparel industry in getting trained manpower. However challenges are in post married life in continuing job, which in turn creating high attrition in Apparel industry. The further research can be made to get the feedback from employer, parents of trainees and life after their marriage.

ABSTRACT

The strong push for skill development in India has resulted in a fast-evolving landscape propelled by game changing reforms and policy measures under the banner of skill India. The report gives a brief outline of the history of skill development in India and highlights the main drivers for the big push towards skill development which are India's demographic dividend and the rapidly growth economy.India adds 12 million people to its workforce every year. By 2030, a third of words working age population is going to be from India. There are as many as 711 million people in India in the working age group of 15-59 years. With the majority requiring additional or new skills. India is a young and ambitious country with skills at the top of its agenda. The skill development policy also gives importance to promoting mobility of labour and encourages certifications and assessments that can ensure national and international recognition of acquired skills.Automobile Services training is an organised training that provides hands-on skill on service and maintenance of two wheelers. Traditionally youth are trained at automobile garage and gain competency by working for many years. It takes lot of time to acquire necessary skill to work on Automobile service centres or to start his own service centres. The researcher has a made study the responses toward the organised training and the quality of skilled manpower developed within a very short span of 3 months to 1year time.

Key terms :

INTRODUCTION

India is the youngest country among the world population. The major challenge today is to develop workforce with employable skills, through vocational education and also higher education to make India a developed economy. It is also essential to create employment opportunity for school dropout students, who couldn't have formal education and left with no choice than to be migrated unskilled labour.The country has 54% of the total population below 25 years of age and more over 62% of the population in the working age group (15-59 years), it strongly indicates that

India is one of the youngest country in world. By understanding global scenario, in coming 20 years, the current workforce in the technologically advanced world is projected to decline by 4%, but in case of India, it will increase by more than 32%. But the serious part is that as per the current statistics only 2% of the total workforce have accomplished skills development and vocational training in India. (www. pibphoto.nic.in). Considering globalization and rapid technological advancements, the skill development and skill capacity building is significant instrument to enhance the effectiveness and quality of skill force to optimize productivity and economic development.

Worldwide it has proved that the skill development is a vital driving force behind the economic stability and growth for the betterment of society of any country. Skill development is a very powerful instrument to empower individuals and improve their social recognition and dignity. This will lead to optimize economic improvements and creation of employment opportunities for aspiring Indian youth.The huge challenge is creating industry standards infrastructure and skilled trainers for skill training, with certain benchmark of quality. This is possible with Govt. policy, funding and support of industry to develop curriculum, provide internship and infrastructure in collaboration with training institutions.

REVIEW OF LITERATURE

Today Automotive Industry is known to be highly dynamic with continuous innovations, in design and development of auto components, changing the face of the industry. To cope up with such dynamic situation, skilling, re-skilling and up-skilling of the existing and future workforce is extremely important. The new jobs, however, are likely to move away from traditional manufacturing and instead be added in the areas of IoT, mechatronics, robotics, 3D printing, AI, machine and deep learning, analytics, virtual collaboration, automotive design, and computational thinking. The emerging and integration of the said technology, requires continuous reskilling of existing manpower working in service sectors and also creates avenues for new skilled manpower to serve the fast growing Automotive sector both in manufacturing and services.

It is evident that there are lot efforts are being made at various level with focused attempt and support by Govt. of India to create employable manpower to serve industry as well as to be self-employed. Employment generation is the one issue other than that employability and productivity is another issue. Currently about 26 million youth are getting into age group for employment every year with about 65% of them looking for jobs. Age and formal education degree is a constraint that affecting for skills development, because of social stigma. Good news is that today, there is no bar in gender for acquiring specific skill for their employment. To make "Make in India" project successful, youth of the nation should be empowered with formal education, technical and vocational training to meet the Industrial requirement as per global standards.

Research Gap

The skill training programme has a long term social benefits in creating employment through skill training. It is essential for all stake holders to have wider prospect of knowledge and feedback on the entire training activity;

- The quality of training programme and activity undertaken in supply chain; starting from mobilisation to post placement support
- The experience and Success story of trainees,
- Trainer's experience
- Employer views.

Research Objectives

Based on need and importance of skill training in our country the researcher tries to find insights that would help all stake holders to take appropriate action as deemed fit.

- To understand the supply chain of skill training services delivered by training organisation
- To highlight experience of trainees and their success story
- To make an impact assessment of the skill training in Retail and Hospitality
- To suggest scope for improvement in training by training providers, funding agency and future participants

Research Design

The convenience sampling method was used to collect primary data.

- Research Type –Descriptive type of Research
- Sample size – 60 respondents
- Trainees at GTET.
- Sampling Area – Bhubaneswar, Odisha

RESEARCH METHODOLOGY

This research is explorative in nature. The researcher has studied the training Programmes and its impact on creating Employment and Self Employment of youths. The Study is in reference to Retail and Hospitality skill training only. Research methodology is divided into five sections i.e. Section I contains Data Sources, Section II analysis of data collected from trainees.

Data Sources and Data Collection

The data required for the study was collected from primary sources on multistage random sampling method from trainees through a structured questionnaire and face to face interview. The secondary sources include books, journals, handbooks, newspapers, circulars, bulletins, working papers, reports, websites and Government departments.

RESULT AND DISCUSSION

The analysis and interpretation of the various opinions given by the various respondents which were collected from the trainees are shown in the form of tables below.

The trainees were asked to respond on the reason for choosing this training programme based on specific criteria. It was found that 73% students have joined this training to get job in an Automobile service sectors.

Motivation to join this Automobile training

68% of trainees had a self-motivation to join automobile service training and got enrolled to be trained and join this sector.

Quality of infrastructure and training support

More than 90% trainees appreciated the quality of training and rated in the scale of Excellent and Good, which a positive remark on training quality.

Quality of training and level of competency to get job

More than 85% trainees had viewed the training as a valuable input in building industry standard competency and will make them emp-loyable.

Feedback on improvement of skill training

The trainees emphasized on creating awareness about this training and counsel youth to get trained in new technology within a stipulated time and start earning.

SUMMARY AND CONCLUSIONS

The future of automotive industry is huge and volatile. The choice and need of customer is also increasing.The change in technologies, demands upgrading the skill of workforce and need specialist in the field of service. The focus has to be dual-mode training which includes the training and the practicing. The current study reveals that skill training in Automobile Services has been an attractive training model for the youth to get industry standard training in an organised set up. It also gives enough theoretical and practical insights on fault finding, assembling an engine and electrical fittings. The training creates wider opportunity to work in Automobile service centres as well as to start own service centre for any two-wheeler as the technology is almost same for all kind of two wheelers. Such training programme has a great demand in urban as well as rural sector, which protect migration of labour from village to city. Further it doesn't need any formal education to be trained and employed. Automobile training will continue to be one of the most preferred training programme for youth for passion and livelihood.

ABSTRACT

Land use and land cover change were among the most substantial perceptible changes that are happening around us. Land use and land cover information in the form of maps and statistical data is very significant for spatial planning, land management and land utilization. With the changing times and growing demand on the availability of land use and land cover information, a standard classification system, precise description of land use and land cover and its categories, standardized data collection and mapping procedures across Indian region on different scales becomes relevant.Detection of digital change is the mechanism that helps to assess changes related to land use and land cover properties with respect to geo-referenced multi-temporal remote sensing data. It helps in recognizing changes that are uncharacterized by natural variability between two or more dates. An investigation was carried to define and measure the land use and land cover changes that have occurred in Odisha District Gajapati over the last 25 years using remote sensing and GIS technologies. Land is a natural resource of prime importance. A city not only increases by population but also by changes in the spatial dimensions. The development of rural areas has led to dramatic changes in land use and land cover. The importance of spatial data technology has been widely used in recent years, in particular the application of remotely sensed and geographic information systems (GIS).The present research explores land use and land cover in the district of Gajapati, Odisha using Landsat satellite images for the years 1991, 1995, 2000, 2005, 2010 and 2015. Supervised classification scheme is used to classify the different groups within the area of

study.The study showed that during the study period the built-up area in the district of Gajapati grew by more than fifty percentages on average. At the other hand, areas under forest, agricultural land, and open fields have decreased respectively by around thirty-eight and thirteen percentages.

Keywords: Land use/Land cover, spatial data, satellite, remote sensing, Image classification

INTRODUCTION

Land use defines the usage of land varying from area to area. In rural areas land use mostly includes forestry and farming [Annegarn H.J, Limpitlaw D, Kneen M.A][6]. In urban areas land use majors housing, commercials or industries. The type of physical and natural features present on the surface of the earth is known as land cover, e.g. Water body, forest, built-up area, etc. land use change, including land conversion from one type to another and landcover modification through landuse management, has greatly altered a large proportion of the earth's land surface to satisfy mankind's immediate demands for natural resources. Human population growth represents the primary driving force in land use change [M. K. Jat, P. K. Garg, and D. Khare][1]. Now a day's new technologies like satellite remote sensing and Geographical Information Systems (GIS) provides data to study and monitor the dynamics of natural resources for environmental management [Prafullaku.Panda and Tanuja G][2]. In the present study it has been mainly two types of data. These are topographic map and remote sensing data. Rural landuse land cover classification is still a challenge with medium or coarse spatial resolution remotely sensed data due to the large number of mixed pixels and spectral confusions among different land use landcover types [Latifovica R, FytasbK, ChencJ, ParaszczakJ][8]. Generally for rural areas, higher resolution images are more appropriate as the land cover structure is complex. Before the pre-processing and classification of satellite imagery began, an extensive field survey was performed throughout the study area using Global Positioning System(GPS) equipment[Sarma K., Kushwaha S.P.S][3]. This survey was performed in order to obtain accurate location point data for each land use and land cover class included in the classification scheme as well as for the creation of training sites [Chitade A.Z, Katyar S.K][4]. The satellite data was enhanced before classification using histogram equalization in ERDAS Imagine 9.2 to improve the image quality and to achieve better classification accuracy. In supervised classification, spectral signatures are developed from specified locations in the image. These specified locations are given the generic name "Training sites" and are defined by the user. Generally, a vector layer is digitized over the raster scene[Zubair, A.O][9]. The vector layer consists of various polygons overlaying different land use types. The training sites will help to develop spectral signatures for the outlined areas[Singh N.P, Mukherjee T.K and Shrivastava B.B.P][5]. Due to involvement of multiple data sets, we used latest technologies like remote sensing imagery, field survey, and existing study area conditions, here the study area is classified in to five categories, i.e. agriculture, built-up area, dense forest, barren land and water spread area. The study area covers 4325 sq. km and land use land cover changes were estimated from 1991 to 2015.

Detection of change is the process of identifying differences in the condition of an object or phenomenon by observing it at different times. Detection of Earth's surface features in a timely and reliable manner provides the basis for a deeper understanding of relationships and interactions between human and natural phenomena in order to better manage and exploit resources [Latifovica R, FytasbK, ChencJ, ParaszczakJ][7]. Due to a shift in land use patterns, however, land covers changes that affect biodiversity, water and other processes that combine to affect climate and biosphere. A detailed understanding of the impact of changes in land use/land cover pattern has become necessary for Gajapati district.This study was therefore undertaken to analyze the extent of human-induced landscape transformation in the affected areas of the district of Gajapatiby interpreting temporal remote sensing data using geographic information system (GIS) and cover types (dense forests, agricultural land, water bodies and barren land) to achieve the above objective.The rest of the paper is as follows: in Section 2, discussed briefly about the study area. In Section 3, have been describedthe materials and methodology. This is followed by resultand discussion in Section 4,accuracy assessment in section 5and conclusion of the paper appear inSection 6.

STUDY AREA

Gajapati district covers a total area of 4325 sq.km. The study area is located between 19°11'28.40"N and 84°11'8.56"E, (Fig-1). This is a district, the major part of which is hilly and with undulated topography. While the entire district has a population 5, 18, 448 the population density of the place is 116.66 persons per sq. km as per census 2001. The district has 10.19 percent population enumerated in areas classified as urban. Due to its agro-climatic conditions, Gajapati gains a large amount of its revenue through the agricultural sector. Also agro-processing and horticulture industries add to the economic wealth of this region.

MATERIALS AND METHODOLOGY

For this study, the orthorectified landsat satellite data was collected as per availability from United States Geological Survey website http://www.earthexplorer.usgs.gov. Satellite images used for this study were acquired from the sensors Landsat TM (Thematic Mapper), *ETM+ (Enhanced Thematic Mapper+)*on board Landsat 7. The study area falls under path row 140/47 of landsat. Details of satellite data used in the present study are provided in Table 1. Satellite images were processed using Erdas Imagine 9.2 software. Supervised classification method was used for mapping vegetation and land cover of the study area. This has been recognized as a most frequent method for remotely sensed data classification.In supervised classification method, the sample of known identify were used to classify pixel of unknown identify. Training sites in the images are generated to represent the typical spectral information of the land use and land cover classes (Forest, fellow land, built up area and water body)[Prafullaku.Panda and Tanuja G][2]. Training pixels are carefully chosen from the landsat images only after conforming their identify by comparing with toposheet, reference and local knowledge[Byeong-Hyeok Y, Kwang-Hoon C][10]. After the selection of training sites, the classification was run on the image using maximum likelihood classifier in ERDAS Imagine 9.2 software.
The brief methodology explained in the below flow chart (fig no-2.)

RESULT AND DISCUSSION

Two major steps include the land use and land cover (LULC) change detection method.

Independently classifying multi-data image and ii) Comparing individual LULC classes taking corresponding pixels in the multi date images.

Major changes were observed in the year 1991 the built up land covered 7.89 percent of the total area, this has increased to 10.8%, 14.44%, 18.7%, 20.68 %&21.8% in 1991-1995- 2000- 2005-2011-2015 respectively and the forest covered 48.72 percent in 1991 and decrease of 44.43%, 42.1%, 40.19%,38.32%&36.57% in 1991-1995- 2000- 2005-2011-2015 respectively and this change has caused the increase in water bodies from 3.34% to 3.32% due to water logging in the year of 1991 to 2000 and also decrease in trend 2005 to 2015. Agricultural land indicates in decreasing trend (25% to 18%) and barren land also varied in between 15% to 20% in the sub sequence years. It has been also observed that Mostly agricultural land converted in to settlement due to increase of population and urbanization.

LAND USE AND LAND COVER OF GAJAPATI DISTRICT

In 1991, forest constituted the largest category with spatial coverage of 48.72% of the total study area. Built up area with 7.89% and agricultural land and open fields, 25% of total area coverage. In the second time period, 1995 forest constituted the largest category with, 44.43% of the total study area. Agricultural land and open fields with 23.01% and settlement, barren land occupied second and third position respectively in terms of total area coverage. Figure-(3a-e) represent the changing pattern of land use and land cover of Gajapati district of study period. LULC of Gajapati district has undergone significant changes during the study period. Table 2: Percentage change in land use and land cover of Gajapati District.

Graphical representation of land use and land cover in GajapatiDistrict

The Graphical representation shows the land changes and its characteristics (Fig no5).Pie charts represents the changing pattern of land use and land cover of Gajapati District of study periodFig no 4 a to f. Land use land cover of Gajapati district has undergone significant changes during the study period. The changes in land use land cover over the past decade show an accelerated growth rate urban/builtup areas with increases of more than 15% in the year 1995 & 28% in 2015,representative of the population increases for this area. Agricultural areas and barren land have shown the greatest amount of decrease in this area, with dense forest decreasing by slightly more than 20%.

ACCURACY ASSESSMENT CLASSIFICATION

Accuracy assessment with the reference of the raw satellite images was carried out in this study. In the classification of maximum likelihood many pixels are often misclassified due to uneven data distribution [Prafullaku.Panda and Tanuja G][2]. Accuracy of classification should be done by ground truthing, or by physical appearance at the site of the study. But time is one of the big resistant in this situation, since you cannot calculate the past with the present.Therefore, acquiring better classification accuracy requires accuracy assessment of both infield and outfield. In this study outfield evaluation was carried out by random sampling of the reference image. To calculate the classification accuracy of each land cover image, the total process was taken by comparing the reference image with the classified image with some random point stratified random sampling.The rationale for using this sampling method is that each land cover class find equal probability of being observed 50 random points were used to assess the accuracy of each classified image. Some observations show the values of the '0' class, which are neglected. Data are summed up and qualified using the error matrix. Three different results of *accuracy-user accuracy, producer accuracy, total accuracy* was generated from the overall assessment which helps to understand the classification accuracy.The calculated assessment result of each classified satellite image from 1991 to 2015 shown in *Table-3*. Calculated total accuracy result for each satellite image (1991, 1995, 2000, 2011, 2005, 2015) given as 92.45%, 87.13%, 88.40%, 92.25%, 85.56%, 91.43%.

CONCLUSION

This paper focuses on improvements to the LU / LC in a rural area, using remote sensing data and GIS technology in Gajapati, India. The results clearly show that LU / LC changes during the period 1991 to 2015 were substantial. There is visible considerable expansion of built-up area. On the other hand, agricultural area is decreasing; water spread area, and forest areas. This study clearly shows the impact of population and their developmental activities on changes in LU / LC.This study proves how effective tool for urban planning and management is integration of GIS and remote sensing technologies. Quantifying LU / LC changes in the Gajapati region is very useful for environmental monitoring organisations, policy-makers and the public to better understand the local region.

ABSTRACT

Across the nation, traditional knowledge system of agriculture varied from the society to society, which curved the history of food self- sufficiency. For centuries, farmers of the nation have stayed in the cave of deprivation, have maintained their distinctive culture of farming, have sustained on their traditional knowledge system. Historically speaking, almost all walks of life, tribal farmers stored their experiences. The experiences of farming stored since ten thousand years and most closely interacted with the socio-cultural lives of the farmers. Indigenous communities practicing farming are the conservator of traditional farm knowledge systems. The present study tried to explore a longitudinal data set on farm related Indigenous Technical Knowledge (ITK) system of the selected villages of Srikakulam, Andhra Pradesh. Multistage sampling has been adopted. The study draws attention on major factors of traditional knowledge systems. The study is based on Ex- post facto research design. The methods of data collection were quantitative and qualitative as well as participatory in nature and were aimed to seek answers to certain research questions. Participatory Rural Appraisal (PRA) and Observation are being the dominant methods. Keeping a foreside to the main objectives, the study emphasizes on understanding dialectics and dictum of ITKs in the context of family farming.

Keywords: Traditional Knowledge System, Indigenous Technical Knowledge (ITK), Family Farming

INTRODUCTION

The idea of farming appears to be ingrained in this earth since 10,000 years. Since inception, Indian agriculture is not merely an occupation, but it is the way of life which for centuries has been shaped outlook of life and livelihood of the nation. For a considerable period of time, farmers of the developing countries have remained in topographical variation, have kept up their particular culture of farming, have managed on family based farming, and attempted to defeat poor financial condition. Agriculture all through the world is up 'til now single most basic human activity. Despite each one of the advances of so called 'development', it is so far the primary source of sustenance and a basic origin of aspects and characteristic of society, whose produced substitutes are routinely not comparable to the normal components or all the more extravagant to make.

A few investigations by the farm dwellers, on experimentation premise have been occurring in the field of agriculture and associated fields for many years. They utilized accessible characteristic of Agricultural Experiences and contrived numerous advancements to expand the quality and amount of the yield of different endeavours, they had embraced. The information in this manner created throughout the years is dependable and has the property of ecologically friendly disposition. Such information is known as the 'Indigenous Technical Knowledge (ITK)'.Indigenous Traditional Knowledge (ITK) is a nearby information that is interesting to a given culture or society (Warren DM et.al 1989). The indigenous frameworks of yield creation developed over hundreds of years of social and organic advancement and speak to the gathered encounters of indigenous ranchers. The farm dwellers produce indigenous crops through information on ecological conditions and regular change without access to outer data sources, capital, and current scientific information (Maroyi, A. Improving et.al 2012).The commitments of indigenous and local information frameworks towards a superior comprehension of biodiversity and its sustainable use and the executives, has been recorded in the logical writing in numerous spaces: biodiversity conservation and wildlife management, customary marine resource management, rural development and agro forestry, traditional medicine and health, impact assessment; and natural disaster preparedness and response (IPBES et.al 2013). By and large, conventional knowledge has been orally passed for ages from individual to individual. A few types of traditional knowledge discover articulation in stories, legends, fables, customs, tunes, and laws (Kala, C.P. et.al 2012).

Objectives of the study

The study is the modest endeavour to highlight-

a) To identify the Indigenous Traditional Knowledge (ITK) in Srikakulam District of Andhra Pradesh
b) To trace out Social interaction pattern, ITK conservation and sustainability of family farms

METHODOLOGY

Research Design: The study was based mainly on Ex- post facto research design. The study was based mainly on Ex- post facto research design. Accordingly, after a thorough and meaningful formulation of the problems, specific objectives were decided. In the light of these objectives, an effort was made to make a thorough review of the relevant literature relating to the previous researches in this field.

The findings of this study have been discussed after analysis of the collected data through questionnaire and interview of the village dwellers on the subject and were subsequently summarized. The findings had been summarized after throwing light on all the major aspects of the study. The conclusion and the suggestions were made to make the agricultural development possible through judicial utilization of ITK.

Locale of the study area: The study was conducted in the selected areas of Seethampeta, L.N.Peta, and Polaki blocks of Srikakulam district, Andhra Pradesh.

Sampling procedure: Purposive- Snow ball sampling method was adopted.

RESULTS AND DISCUSSION

Documentation of the Indigenous Traditional Knowledge (ITK) in Srikakulam District of Andhra Pradesh

The inception of indigenous information can be followed back to the antiquated period. Individuals utilized such information from age to age for their work in an unaccounted way. There is no composed archive for recording and storing of such information. It is found that such information/ knowledge framework is fundamental for agricultural development. It must be accumulated and reported through a specific network.

Here is the list of ITKs, collected during field study

1. Farmers use Mahua (*Madhuca indica*), Mustard and Neem Cakes to maintain the soil fertility and moreover to protect crop from soil born insects and diseases.
2. Decomposed leaves, crop residues and forest waste materials are mixed in the field followed by harrowing by bullock drawn blade harrow.
3. Forest residue and soils broadcasted over the field and deposit during rainy season to increase the soil fertility.
4. Dhenkur system for irrigation: This is a traditional method of irrigation in which farmers irrigate field with the help of bucket attached to wooden handle. It requires continued/ permanent manpower (labour) to operate irrigation.
5. Farmers walk around the field and press the soil by foot to ensure the ploughing condition.
6. Hal: Deshi wooden plough used for ploughing or cultivation.
7. Hundi and Tokani: Broadcasting method of sowing of seeds is most popular among the tribes. During broadcasting the seeds are kept in Hundi (soil made pot) and Tokani (bamboo made pot).
8. Jarkati: Used for harvesting purpose.
9. Dusting ash to control aphids
10. Beating drum in standing crop to scare birds
11. Ants running from down to up with their eggs indicates heavy rain.
12. If rainbow appears in the east in the evening or west in the morning, it will rain.
13. Clouds of dark brown colour cause heavy rains for a fortnight.
14. Dragonfly flying near the ground is an indication of rain.
15. In storage structure some rural folk have “Dhusi” made of paddy straw, which is a low cost device and help in storage of grains/seeds for longer duration.
16. To prevent termite problem, mucidi leaves (*Strychnosnux-vomica*) are applied as green manure in direct sown paddy.
17. Onion, neem leaves, common salt and turmeric slices ensure the safely storage of grains.
18. Tentemu leaf (*Cassia tora*) and jeelugu (Caryotaurens) twigs are incorporated during second ploughing for better decomposition and utilization to improve soil fertility.
19. Tribal farmers apply 50 kg of neem cake in paddy field during puddling to control insect pests and improve soil fertility.
20. Laying of stone bunds around the fields across the slope for preventing soil erosion and for conserving moisture is practiced.
21. Spray of Neem extract solution to control leaf minor insects.
22. Tribal farmers dust the mixture of kitchen ash and turmeric powder on vegetables to prevent the aphid attack.
23. A man like effigy made up rice straw wearing a dress and head is covered with an earthen wear made like a human head is used to keep in the centre of the field. The birds fly away because of human appearance in the field.

24. A man made structure known as "Kakbhagoda" is used for protection from birds.
25. A man made structure known as "Mairamadicha" is used for supervision of crops as well as protection from animals.
26. By use of bamboo stick for threshing.
27. By moving bullocks on the circle over the crop, spread in the threshing floor.
28. Uprooting by hand for weeding.

Along with these, some more ITKs were identified through FGD. Here lies the detailed transcription.

Social interaction pattern, ITK conservation and sustainability of family farms

Thus of a complete investigation of different government and non-government institutions connected with the advancement of agricultural improvement it was recognized that there were essentially five classes of institutional systems that could have a beneficial outcome in the same. The parts of the current institutional system are as per the following-

- Government Institution and professionals (92= KVK, 97= BTM, 100, 101= Block level organization)
- NGOs (93= Society for Participatory Action and Reflection , 94= TSCSR, 95= Tagore Society, 96= Jan ChetnaManch)
- Input dealers (91, 98,99)

Blue circles were depicting the institutions. Red circles were the respondents. Green arrows were depicting reciprocal relationship among the respondents. Evaluating the sociogram depicted here, it was found that 94, 95, 96, 92 were the most frequently chosen institution. Out of these, 94 and 95 had highest impact in community. The size of the blue boxes is directly proportional to the impact of the institutions.

The initial phase in building limit with regards to systems administration in rustic groups will begin from helping the provincial individuals to comprehend their administration comprehend and envision their current systems (Douthwaite et al., 2006). Here it is clear from the Figure 4.2.4 that farm related information is mostly spread by NGOs, KVK (KrishiVigyan Kendra)s, BTM (Block Technology Manager)s and agricultural input dealers.

Here, NGOs and agricultural input dealers are playing most vital roles. It is because of their ability to penetrate in grassroots level. The data, obtained from sociometry, has been quantified and analysed through UC NET.

NGO's sort out preparing programs for the wage creating exercises (IGA). A portion of the NGOs' capacities and points of interest, as indicated by Streeten (1997) are:

- They are great at coming to and assembling poor people and remote groups;
- They cause enable needy individuals to pick up control of their lives, and they work with and Fortify nearby establishments;
- They do ventures at lower expenses and more effectively than the administration organizations and (4) they advance supportable improvement.

From sociograms, obviously a large portion of the expertise advancement programmes for farmers were conceived by the nearby NGOs of the review range. KVKs (Govt. Establishment) had less effect than the NGOs. Different establishments like Bank and Input Dealers have no effect on aptitude advancement preparing.

CONCLUSION

It may be finished up by saying that in one hand Traditional farming is exceptionally powerful instrument for improving the financial situation of farm dwellers regardless of their types (marginal, small and for banishing joblessness and underemployment) by judicial utilization of the resources. During this study, 28 ITKs were

identified. From Sociograms, obviously a large portion of the expertise advancement programmes for farmers were conceived by the nearby NGOs of the review range. KVKs (Govt. Establishment) had less effect than the NGOs. Different establishments like Bank and Input Dealers have no effect on aptitude advancement preparing.Effect of common society and Government Organizations are continuously recognized as authority by exchange of innovation. The foundations are considered as the administrators of spreading new advances. Hence, traditional knowledge system should be blended with mainstream agriculture.

ABSTRACT

Since time immemorial, Indian Agriculture has paved the path of culture. The idea of farming appears to be ingrained in this earth since 10,000 years. Since inception, Indian agriculture is not merely an occupation, but it is the way of life which for centuries has been shaped outlook of life and livelihood of the nation. For a considerable period of time, farmers of the developing countries have remained in topographical variation, have kept up their particular culture of farming, have managed on family based farming, and attempted to defeat poor financial condition. The present study tried to explore a longitudinal data set on farm related Indigenous Technical Knowledge (ITK) system of the selected villages of Srikakulam, Andhra Pradesh. Multistage sampling has been adopted. The study draws attention on major factors of traditional knowledge systems.Agriculture all through the world is up 'til now single most basic human activity. Present study is intending to ventilate the ethno-culture of family based farms. The study was set in the background of Chotanagpur plateau of Jharkhand. It considers tribal farms as the unit of ethno-centric agricultural system.

Keywords: Family Farming, Ethnographic Analysis, ITK, Jharkhand

INTRODUCTION

Mazyer and Roudart (2012) explained the history: if humankind somehow managed to permit each developed biological system of the planet to lie neglected, each would rapidly come back to a condition of nature near that in

which it existed 10,000 years ago. Wild vegetation far more grounded than those current today would overpower developed plants and tamed creatures. A predictable reaction of farming extension and strengthening has been the fracture and disconnection of normal natural surroundings inside an inexorably inadmissible lattice for some species (Donald et al., 2001). Natural surroundings discontinuity and its belongings prompt a scope of environmental and biological system changes. Among these, biodiversity characteristics, for example, species arrangement, group structure, populace elements, conduct, reproducing achievement, and individual wellness are adversely influenced (Silva and Pontes, 2008). A few investigations by the farm dwellers, on experimentation premise have been occurring in the field of agriculture and associated fields for many years. They utilized accessible characteristic of Agricultural Experiences and contrived numerous advancements to expand the quality and amount of the yield of different endeavours, they had embraced. The information in this manner created throughout the years is dependable and has the property of ecologically friendly disposition. Such information is known as the 'Indigenous Technical Knowledge (ITK)'. Indigenous Traditional Knowledge (ITK) is a nearby information that is interesting to a given culture or society (Warren DM et.al 1989). Spradley (1973) defined the methodology of 'Ethnographic' Analysis. It was used by the anthropologists. According to him, it is the work which describes the culture. Again he added that the goal of ethnographic analysis was to synthesize parallel way of life from the native point of view. In this sense, 'Ethnographic analysis of Family Farms' anticipates to express the culture of farm and farming.

METHODOLOGY

Sample size: 270 samples were drawn by using Multistage Purposive Sampling.

Sampling Design: From the district, 3 blocks having >60% tribal population had been selected. Thereafter, 3 villages were selected from each block. After that, 30 farmers were selected from each village.

SELECTION OF THE STUDY AREA

1. **Selection of the district:** Jharkhand is comprised of 27 districts. Out of this one district namely East Singhbhum was conveniently selected for the present study.
2. **Selection of the block:** There are 11 blocks in Deoghar district. Out of these 11 blocks, three blocks namely Ghatshila, Patamda and Baharagora block were purposively selected for the study.
3. **Selection of village:** Darisai, Bodhpur and Bhamradih villages of Ghatshila block, Dongagarh, Dhatkidih and Loraidoongri villages of Patamda block, Jarabani, Pochakhuli and Satpati villages of Bharagora block were selected. Figure 1 describes the framework of the Ethnographic Analysis of the Family Farms.

The steps in 'Ethnographic Analysis of Family Farms' using the observation, discussion as adapted are-

- Personal Interview of the sample farmers. Visit the farms with them.
- Discussion with the farmers.
- Topic of discussion- Land classification, Land Management, Cropping Pattern/ System, Farm Management, Agricultural operations etc
- Verification of information.
- Sketching and documentation of important operation and facts.

RESULTS

Outcome of the investigation

Traditional land Classification: In accordance with the description of space utilization pattern of the farms, land classification is one of the most important concerns. In keeping with the specific characteristics of the land, it is classified into two major segments- Upland (Local name- Tanr) and Low land (Local name- Doin/ Don). Based on

some essential characteristics, Tanr is again divided into three parts- Tanr I, Tanr II and Tanr III. Doin/ Don have three more divisions- Don I, Don-II and Don III. Detailed description of 'traditional land classification' is presented through table 1.

Identified indigenous farm practices

Table 2 depicts various identified indigenous farming practices under each family farm.

DISCUSSION

Indigenous soil management practices: Conventional farming is frequently viewed as a stage between the neighbourhood chase and-assemble rehearse, which furnishes groups with subsistence levels of nourishment, and the acts of present day agribusiness, utilized for large scale manufacturing of sustenance for worldwide dispersion. Customary rural methodologies are not down to earth for mass sustenance generation, but rather represent a considerable measure of neighbourhood nourishment creation in the creating scene (Jeeva, Laloo and Mishra, 2005).

Preparation of land: Preparation of land is critical to guarantee that the rice field is prepared for planting. Generally 4-5 ploughings are used for tillage operation. A well prepared land controls weeds, reuses nutrients, and gives a friable soil mass for transplanting and an appropriate soil surface for direct seeding.

Furrow opening: This type of operations were done to prevent water loss and to store the rain water. The locale of East Singhbhum comes in the discrete precipitation range and in the absence of legitimate administration framework the greater part of the water goes squander as spill over. Figure 4.1.2.17 depicts furrow opening structure for water conservation

Summer ploughing: It is mostly done in low lands (*Don*). It raises the water holding capacity of the soil and reduces water runoff. It also helps to control insect-pest infestation in field. Singh and Sureja (2006) opined that it exposes egg end spores of insects to hot sun light. As a matter of fact, incidents of pest infestation were reduced by this cultural method. They also told that it was one of the most popular ploughing methods.

FYM based manuring: The farmers of the study area used to store cow dungs in handmade basket or in the corner of field (Heap method). Well decomposed cow dung is good for soil health. In study area, peoples were using FYM since 50-60 years.

Small water holding structures: The study canvassed the findings on traditional water management structures of the study area. In this portion, it was documented how the farm dwellers used to manage the indigenous water holding structures. From the study, it was revealed that they had micro water holding structures like- Doba/ Pukra, Happa.

Doba is a micro water holding structure which occupies 1-2 ha land. Onset of monsoon, it conserves 4-6 m^3 water. Dey and Sarkar (2011) also found 'Doba' as a part of traditional water harvesting structure. They explained that In spite of the fact that on a normal 140 cm precipitation is gotten in Chotanagpur level, water is the absolute most essential limitation in foundation of agro-ranger service. Simultaneously, each Doba structure with 4.5 m3 limit (3.0 m length, 1.5 m broadness and 1.0 m profundity) has been developed for gathering of water before the onset of rainfall. They also opined that the drainage water from the fields which streams in little rivulets is gathered by developing a bund in the lower spans of the rivulets and where water can be put away. Contingent on the accessibility of seepage water, comparative bunds might be built at many focuses along the length of the rivulets.

Happa, a water holding structure, was made through excavating the field. Jana (2011) opined that the sides of a Happa were ventured with slant of 1:1 to such an extent that both animals and human can get to the water of Happa effectively. A Happa was developed by the side of rural field of a rancher with normal length of 45 ft, broadness of 50 ft and profundity of 12 ft.

Along with *Happa*, roof water harvesting was also done by the farm dwellers. By using 'Dugout' structure, some farmers were harvesting rain water. Some NGOs and GOs were promoting the structure in the study area. Water harvesting was also done by field bunding and terracing.

Threshing and Winnowing: Winnowing is an indigenous method to segregate rice grains from chaff. Chaff is the scaly cover of paddy grain. With the help of '*Kulha*' winnowing is done by blowing off the chaff. Threshing helps to remove grains from straws. Winnowing also helps to wipe out stored grain pests like- weevils.

Plot levelling by indigenous wooden leveller: For levelling the plot traditional leveller ('Soohaga') were used. It is a bamboo made instrument, having wooden plank.

Crop residue mulching: Crop residues are the by-products of the crops. In the study area, crop residues were used for mulching. They were practicing this type of mulching since 15-20 years. Mostly paddy residues, straw, tree leaves were used for mulching.

Stone weir/ bunding: Stone bunding is a traditional method of soil and water conservation. These bunds are made with locally available stones across the slope. During high rainfall, it helps to store water and to stop soil erosion. To stabilize their bunding people use to plant some bushes and plants there. **Stone cum vegetative**bunding was also popular in the study area. **Stone cum earthen bunding** includes building stone bunding at the construct took after by earthen bunding with respect to the top. In some cases, in stone bunding, soil is filled into work as an establishing operator.

Pest and disease management: Other than hand weeding to control weeds, some farmers often used kerosene and neem oil to control the weeds. Kerosene was also used to prevent pest infestation. Cultural methods like- water logging, trap cropping were used to control termites and other crops.

Indigenous instruments for fishing: There were several traditional fishing instruments; out of which two were documented.

Taap/ Machchibaksha: It is made of bamboo sticks. Conical shaped baskets are prepared by the local fishermen. At the top of the basket, one ring is attached. Height of the instrument is 80-90 cm. At the end/bottom of the basket, there is another ring which is bigger in size. These types of fishing instruments are generally used in shallow depth water bodies.

Major benefits of these kinds of conical baskets are- 1) Cost of production is low (Rs. 90-150/-), 2) User friendly and 3) Easy to carry.

Ghanj: This is a traditional fishing trap which is prepared from bamboo sticks. It is tied with nylon threads and looks like 'V' shaped folded mat. It is mostly used in the weed infested ponds where net is not useful.

CONCLUSION

Everybody now consents to the way that expanding populace and land discontinuity will influence human oversaw frameworks also. Cultivating frameworks, specifically, is helpless against such changes. Since living has turned out to be more mind boggling than some time recently, human need, particularly nourishment propensities, has likewise been moving quickly and among the general population agreement is progressing that by itself cultivating can't meet these developing requests of the general population by harvest development as it were. It needs enhancement with different endeavors in the cultivating frameworks to adapt up to this change.

Family farms allude to the homestead where in at least two differing financial endeavors are coordinated with ranch assets for accomplishing their more full use, acknowledge most extreme benefit and guarantee returns. Along these lines, the essential goal of the Farming System is to enhance quickly the financial states of individual homestead families by expanding change, heightening and expansion of various undertakings and generation methods keeping

in view the most recent advancements, requirements forced by assets, social taboos and the earth. Keeping this in view, the present review was embraced with the accompanying destinations.

Table1: Traditional land classification

Revenue Classification	Sub-Category	Character	Indigenous Name	Major Crops
Tanr (Upland)	Tanr III	Highest strip of upland, Worst soil fertility, Sloppy, Lumpy texture	*Tanr*	Not suitable for cultivation, Mostly human habitation
	Tanr II	Next strip of Tanr I, Erosion prone, poor soil fertility, coarse texture	*Gora Jameen*	Some vegetables (rare)
	Tanr I	Just above the Don III, Soil fertility better, water holding capacity is better than Tanr I and II	*Bari Jameen/ Bhumi*	Mostly used for vegetable cultivation, Rice (broadcasting)
Doin/ Don (Low Land)	Doin/ Don III	Superficial low land, Extension of Tanr I	*Charura Bari*	Rice
	Doin/ Don II	Fertile low land	*Tarkha Bari*	Rice (suitable)
	Doin/ Don I	Lowest strip, Most fertile land	*Ghogra*	Rice (suitable)

ABSTRACT

Man/Woman, by virtue, is a social animal. People are interdependent in a society. Various factors and web of several relationships created a symbiotic relationship among the dwellers of a society. This relationship, then, depends on the fecund recital of the interaction pattern. Extension Workers ensure the arrangement of transferring new agricultural technology and thought to the farming community for sensitizing them. The specialists, hence, not just advises farmers to enhance their production and set up an orientation, additionally inspire them to use new farming technologies according to their conveniences.Extension worker has a critical connection between research associations and farmers. In a settled farming system, small farmers are made fit for utilizing new innovation and extension workers are relied upon to disclose to the farmers the mechanical focuses required in the utilization of new agrarian advancements.This paper has campaigned the analysis and discussion of role perception and role consensus of extension workers. It has an impact on overall role performance of the extension workers.

Keywords: Extension agents, Family Farming, Sustainable Livelihood, Network Analysis.

INTRODUCTION

The poor village dwellers are capacitated because of different reasons, for example, the greater part of them are socially in reverse, ignorant, low inspiration and poor monetary base. Separately a poor is poor in financial condition as well as need access to the learning and data, which have turned out to be most imperative parts of today's advancement procedure. Be that as it may, in a gathering the poor can defeat a hefty portion of these shortcomings (Talukdar and Dutta, 2009). Institutions and NGOs frequently assume a crucial part in the mass preparation, and usage of FS Models. They have powerful grass root level infiltration. To execute inventive Agricultural Technologies, NGOs have basic part of making mass refinement. Bose et al. (2003) opined that they would work with government, state, and nearby pioneers to propel the objectives… . NGOs likewise have specialized and human asset ability, which they can use to help decipher very mind boggling logical ideas which controllers, lawmakers, and individuals from people in general can promptly get it.

Organizations are sharpening essential partners (women and men farmers) and they could assume a huge part in starting a SHG and furthermore masterminding specialized ability improvement programs for the SHG individuals. Women/Farmers are regularly ready to grant specialized information and expertise. A few NGOs are likewise attempting to create promoting chains during the time spent building up on a venture by them for greater manageability.

Networking and livelihood framework of intuitions: Use of SNA (Social Network Analysis): Effect of common society and Government Organizations are continuously recognized as authority by exchange of innovation. The foundations are considered as the administrators of spreading new advances. SNA has been utilized to tackle an extensive variety of issues in Sociology and Anthropology (Kossinets and Watts, 2006). Studies are additionally found in the Economics writing, for example, contemplates on effect of systems on the selection of developments (Bandiera and Rasul 2006; Temel et al., 2003) adjustment to instabilities (Beuchelt and Fischer, 2006) and accomplishment in finding an occupation (Granovetter, 1973).

Use of SNA has as of late been made with regards to Agricultural Knowledge and Information System (Spielman et al., 2009) that conceptualizes rural learning improvement as the result of connection among numerous partners. This has additionally been connected for understanding Agricultural Innovation Systems (AIS) of the Third World nations (Spielman et al., 2009, Asres, Sölkner, Puskur, and Wurzinger, 2012). This application now should be extended for job framework examination, of which AKIS and AIS are parts. Sadly, this has once in a while been utilized as a part of the examination of rustic vocations, in spite of the fact that cases might be found where organize investigations have tended to a piece of occupation framework (Cinner and Bodin, 2010).

The network analysis will help us comprehend the individual and institutional systems that support rustic occupations, which lay ground for key correspondence and advancement intercession. Also, the initial phase in building limit with regards to systems administration in rustic groups begins from helping the provincial individuals and their specialist co-ops comprehend and imagine their current systems (Douthwaite et al., 2006). Truly, one of the survival techniques of the country poor, for example, negligible or little agriculturists, tenant farmers and landless workers, is their potential and capacity to get assembled and go about as a class with a specific end goal to satisfy their requirements or requests. On many issues, especially the ones which are of aggregate intrigue or which require haggling with the individuals who have power and expert, activation as a class assumes a key part as an issue of their technique. Once more, in course of their day by day life, circumstances regularly emerge when a need is confronted by a family which it needs to satisfy quickly even by taking assistance from others. In such conditions they act independently as a family unit or a family. They connect with each other as neighbors, companions, families, managers/representatives, and so forth. Consequently they step by step develop systems of customary communication through these ties (Jana and Choudhuri, 2013). We mark these systems as informal communities. These informal organizations work at family/family level and assume an essential part as a sort of procedure for survival of the rustic poor. Since one who has a place with such an interpersonal organization can ask for others in a similar system for help and support. Such streams of help and support work, in an unnoticed way, so to state, either

specifically, match shrewd, or through middle people in the system. Subsequently this procedure works underneath the surface, staying under the radar, yet relentlessly, to meet different dire prerequisites of day by day life and living that one can't satisfy by one's own particular assets within reach. Informal organizations, in this sense, give a procedure of asset assembly separately from those with whom one has arranged associations. Seeing such systems are of gigantic significance for genius poor innovative work.

A livelihood framework of institutions contains abilities, resources and exercises required for methods for living (Chambers and Conway, 1992). A reasonable job permits to adapt to and to recoup from stress and stuns, to keep up or upgrade its abilities and advantages for give feasible occupation chances to the people to come. A family unit's benefits comprise of the supply of assets used to create prosperity (Rakodi, 1999). Resources incorporate human capital (age, instruction and preparing, and family structure); normal capital (e.g., climate, water and land); physical capital (gear, domesticated animals, and power); money related resources (credit); area particular elements, (for example, access to framework and social administrations), and social, political, and institutional resources, including social and political systems, and social consideration.

A role based framework is a method for seeing how family units determine their role. A simple mind-set inside a farming system is utilizing the family triangle of benefits, capacities and exercises. Family unit individuals utilize their abilities and resources for complete exercises for maintaining employments. Family unit resources allude to the assets that families possess or have admittance to for picking up an occupation.

Role of Extension Workers and Institutions in 'Technology Transfer': The "Technology Transfers" is really an auxiliary procedure of learning. The key segments of an exchange can be distinguished as information, gets from true experience together with human skill fit for changing that learning energetically. Innovation exchanges incorporate a scope of formal and casual participation between innovation engineer and innovation searchers. Also, innovations exchanges include the exchange of information and specialized know how and additionally physical gadgets and gear (Atalb, Felipik and

Skowron, 2015). Chitambar (2015) characterized 'Social Organization' as the classes of human relationship structures wherein people deliberately related in efficiently coordinated units to progress and fulfil some ordinary purposes or interests that are not especially conveyed in the foundation. In affiliation each part has a formal status and part. It may be described as a social event with exceptional concern and interests that have developed a structure including specific parts for various people, and that have a practically formal course of action of rules and headings for operation. An affiliation differs from a foundation by its consideration on a scarcely confined reason. It is social event of people dealt with to look for after specific objectives. Affiliation may work inside association. Be that as it may, the idea of "establishment" is very extraordinary. Horton (1964) opined that foundation is a sorted out course of action of social associations which encapsulates certain consistent qualities and methodologies and meets certain basic needs of society.

Atalb, Felipik and Skowron (2015) opined that- after the exchange of rural innovations (agrarian innovation) to ranchers, which depends on their requirements for those strategies, it ends up plainly important to persuade them to embrace these new horticultural systems. It is the obligation of individuals working in the horticultural augmentation to induce ranchers to grasp the new innovation and agrarian innovation forms. The reception is a mental procedure which comprises of a few phases and identifies with the agriculturist's choice to acknowledge or dismiss a specific method.

Extension workers are work force who is in charge of meeting the objectives of augmentation framework. Notwithstanding, there have been less information on the parts and execution of augmentation specialists in the nation, despite the fact that there are sporadic reviews on feedback that expansion was not having the capacity to play out the fundamental changes in the country group (Sallam and Akram, 2005). As per Van lair Ban and Hawkins (1996) horticulture expansion is an open administration for HRD of specialists in agribusiness part, including agriculturists. In any case, the capacity of farming expansion is not just observed as vehicle for spreading logical and

specialized advance and innovation exchange. The horticultural expansion, in this manner, is a more extensive idea which stressed usage of undertakings, conveyance of learning and data.

The framework is likewise a road for shared association and opportunity that help individuals to create answers for their issues.

Mode of communication in family farms: Allwood (1985) in his article, the meaning of intercultural communication, possible problems between communication patterns problems and consequences related to intercultural communication were discussed in detail. Hossain, Crouch, Chamala (1992) described the mode of intercultural communication. This review explores the correspondence channels through which data on two rural practices is spread in a remote territory of Bangladesh. Two noteworthy cultivating hones, high-yielding assortments (HYV) of rice development and treatment of debilitated cows, were analyzed. The data looking for example on account of HYV development was described by an extensive number of supposition pioneers being accessible for counsels with other learned agriculturists outside the specimen towns, and by a multi-step relational correspondence design. On account of debilitated dairy cattle treatment, just three nearby conventional veterinary specialists were distinguished as key assessment pioneers. Not at all like HYV rice development, was the correspondence procedure in the treatment of debilitated steers immediate. The potential value of indigenous-based, fitting, appropriate, and adequate innovation is additionally delineated.

Mulvaney (1994) concentrated the valuable and suitable perspective of sexual orientation correspondence as a type of intercultural correspondence. He offers a short introduction on sexual orientation contrasts in correspondence with essential accentuation on cases that show how sex is both an impact on and a result of correspondence. To put it plainly, this dialog highlights essential pretended by correspondence in sexual orientation issues. Gillett (1997) in his study on the intercultural communication, Andy Gillett identify five broad areas which are- cultural behaviour: people from different cultures do things in different ways, students perceptions, culture, cross cultural pragmatics and language. On the other hand Jha and Chauhan (1999) described the intercultural communication issues. The principle components of this review were to look at the relational correspondence conduct of dairy ranchers in the Darbhanga area of Bihar. When all is said in done, it was found that age, arrive holding, crowd estimate and financial status were straightforwardly identified with the relational correspondence conduct of these agriculturists, though social interest and family size or sort had no such relationship. In their article, Fell (2000) depicted another improvement in correspondence hypothesis emerging from subjective science is quickly checked on as a reason for recommending that the utilization of words is a specific sort of activity with inconspicuous and significant outcomes that are effortlessly thought little of. This new intellectual science bolsters a changing rationality and style of farming augmentation that inclines more towards helpful learning. Certain examples of word utilization that happen in organized rural augmentation (orders and authoritative opinion, specialized language, holing up behind convention, exhaust words, feedback, arranging phrasing and parenthood articulations) are presented as boundaries to viable correspondence. Expanding dependence on email and the World Wide Web has conceivable advantages related with a more casual and by and by mindful utilization of dialect. Sinha and Sinha (2001) examine informal communication among rural women on home improvement in Haryana, India. Its specific objectives are: to find out the perceived importance of different home improvement message; to find out the informal communication pattern among rural women; and to study the places of informal communication in a village setting. Informal communication plays important role in transmitting innovative messages on home improvement.

Gasperini and Zulberti (2002) opined that 70 per cent of the poor live in rural areas. Despite the fact that education is a basic right in itself and an essential prerequisite for reducing poverty, improving the living conditions of rural people and building a food-secure world, children's access to education in rural areas is still much lower than in urban areas, adult illiteracy is much higher and the quality of education is poorer. In this regard, the Sustainable Development Department of FAO and UNESCO have joined forces to establish a new flagship on Education for rural people (ERP) within the Education for All initiative. The flagship seeks to address rural-urban disparities, which are a serious concern to governments and the international community as a whole. Le Baron (2003) inferred that each of the factors examined in this module - time and space, moral duty and destiny, face and face-sparing and nonverbal

correspondence are significantly more perplexing than it is conceivable to pass on. Each of them impacts the course of correspondences, and can be in charge of contention or the acceleration of contention when it prompts miscommunication or distortion. A socially familiar way to deal with struggle implies working extra minutes to comprehend these and different ways correspondence shifts crosswise over societies, and applying these understandings keeping in mind the end goal to improve connections crosswise over contrasts.

Singh, Narwal and Malik (2003) assessed the communication skills of 85 horticultural development officers (HDOs) working in the State Department of Horticulture, Haryana, India. Three broad areas of communication were considered: communication ability, communication quality, and preparation and use of audio-visual aids. Majority of the HDOs (64.71%) possessed fair communication skills, while 20% and 15.29% possessed good and poor communication skills, respectively. Correlation analysis revealed that mass media exposure, communication pattern, credibility of information, and role performance had significant and positive relationships with the level of communication skills of the HDOs. On the other hand, Barman, Pradhan and Majumder described that the correspondence level of ranchers from exceptionally urbanized towns in Dakshin Dinajpur locale, West Bengal, India, was evaluated in light of an examination of causal variables of agro-economic and socio-personal nature. Of these causal variables, trimming force, occupation, per capita pay, instruction, house sort, and material ownership had a noteworthy commitment in portraying the ranchers' correspondence level. Jiang (2006) examines intercultural correspondence and its centrality to advanced education. The paper quickly talks about culture, subculture and the meeting of societies. It additionally gives a short study of advancements in intercultural correspondence look into. The creator contends that receiving inter-culturalism in light of the standards of correspondence and regard at the national and institutional levels is more urgent than only acing some intercultural skills or applying some intercultural correspondence models plot in intercultural correspondence speculations. An experimental study, done by Prathap and Ponnusamy (2006)- on the relative effectiveness of four mass media channels (radio, television, newspaper, and Internet) on knowledge gain was conducted among 144 rural women belonging to self-help groups of three villages in Tamil Nadu, India. The selected technology, rabbit farming, was developed into parallel messages and was delivered through these channels to assess the knowledge gain. All the respondents (100%) had gained "adequate" knowledge after exposure to television, newspaper and Internet, while 97% of those exposed to radio had gained adequate knowledge after exposure. Traditional Medias were found to have a slight edge over new media in terms of influencing knowledge gain. Television was found to be the most effective treatment, followed by newspaper, Internet and radio.

CONCLUSION

Data, benefit, item are basic segments of the Sustainable Livelihood structure, basic to bolster basic leadership and execution forms at each level. A Strategic Program in Support of Sustainable Livelihood with extension agents ought to plan to enhance linkages between procedures of arrangement outline and usage, and the manageability, efficiency and benefit of employment results. Interpersonal organization in support of with extension agents, in this way, has three capacities: 1) to encourage the trading of data by the poor vital for economical jobs; 2) to enhance correspondence inside and between the establishments in charge of settling on choices that influence job alternatives; and 3) to engage poor groups to take part in the basic leadership forms.

Enhanced data alone however is not adequate for enhanced basic leadership. Basic leadership is a political procedure and partner interest in basic leadership procedures is critically imperative. The Sustainable Livelihood approach is on a very basic level individuals focused and requests a point by point participatory evaluation of the qualities and data needs of target recipients and partners as an early action in program plan. This needs to connect with partners at all levels, advance two-path streams of data amongst them, and focus on the part of data in connection to various business resources.

Present approach stresses multi-sectoral coordinated effort and associations between government divisions, open and private segment, common society and global improvement offices and looks to expand on existing qualities and openings and to supplement and upgrade existing frameworks. Systems to enhance joint effort between partners through, for instance consistent gatherings, workshops and courses, and new announcing strategies are likely thus be more imperative than presenting new data innovations, which ought to, themselves try to upgrade and reinforce existing advances as opposed to supplant them.

ABSTRACT

Across the nation, traditional farm based livelihood system varied from the society to society, which curved the history of food self- sufficiency. In recent past, paradigm of farming system research has been shifted towards family based farming. Indian agriculture is not merely an occupation, but it is the way of life which for centuries has been shaped the life and out looks of the nation. It symbolizes peoples' struggle against economic deprivation. For centuries, tribes of this region have stayed in geographical isolation, have maintained their distinctive culture of farming, have sustained on subsistence family farms, and struggled to overcome poor socio-economic condition. Characterization of the farm resources and sustainability assessment of those farms are urgently needed, particularly in the context of natural resource management and socio-economic realities.

Keywords: Family Farm, FFS research, Evolution, Participatory Farm Analysis

INTRODUCTION

The idea of farming appears to be ingrained in this earth since 10,000 years. Since inception, Indian agriculture is not merely an occupation, but it is the way of life which for centuries has been shaped outlook of life and livelihood of the nation. For a considerable period of time, farmers of the developing countries have remained in topographical variation, have kept up their particular culture of farming, have managed on family based farming, and attempted to defeat poor financial condition. Agriculture all through the world is up 'til now single most basic human activity. Despite each one of the advances of so called 'development', it is so far the primary source of sustenance and a basic

origin of aspects and characteristic of society, whose produced substitutes are routinely not comparable to the normal components or all the more extravagant to make. The farming communities, throughout the third world countries, have remained outside the domain of the so called 'development' since they dwell in rural areas which are away from the cities.

There have, notwithstanding, been remarkable endeavors made by different reviews. According to World Bank (2008), Agriculture is a source of livelihoods for 5.5 billion people in the developing world of which 3 billion live in rural areas. Nearly 2.5 billion of these rural people are involved in agriculture of which 1.5 billion belong to smallholder households. These resource poor farmers constitute the majority (85%) of farmers in the developing world.

From the studies of eminent social workers and scholars like; Craswell (1998), Das (2013) it has been found that The concept of 'Family Farming' broadly refers to a special character of the farms which are sustained on the involvement of the family members with less dependence on high external inputs. Ever since the small farms depend on the family members and it created a tradition and culture of farming.

Triumph of the concept- 'Family based Agricultural System: During the end of 1950s, India faced a series of famine which shook the aspects of food security of the nation. This was a history of vulnerability and insecurity. Need for significant change in agricultural sector was felt. On set of 1960s, India launched Intensive Agricultural District Programme (IADP) to raise the food grain production. It was a significant developmental programme for the farming community which had been adopted, explored and evaluated. But it was not enough to ensure self-sufficiency in food production. At around the same decade Government of India launched a new programme, entitled as High Yielding Variety Prgramme (HYVP). It was a backup programme for Green Revolution. High yielding varieties, chemical fertilizers and input oriented approach created a vibration in the pulse of Indian agriculture. It was much more technical rather than institutional. Green revolution created a huge difference in Indian economy. But its impact was restricted in the periphery of the large farmers. Small and marginal farmers were unable to reap the benefits of this revolution. Rampant use of chemicals was ensuring the declination of soil health. As a matter of fact, it became an agenda of developmental priorities.

On the other hand, in our nation, greater part of the farming community has a place with small and marginal farmers (76.2%) who have just 29 per cent for operational holding, while 71 per cent of the worked region is controlled by farmers who have medium and expansive size possessions. The nourishment, feed and fuel generation should be expanded by 60 per cent in the following 25 years to address the issues of the developing countries. Hence, it is clear that majority of the farmers of this nation belong to small and marginal categories.

Thus a paradigm shift is advocated from high input based agriculture to the family based small farms which are embedded in the principles of productivity in perpetuity without associated ecological or social harm. The Green Revolution is shifted to the concept of an Evergreen Revolution when it is routed in the principles of ecology, economics, and social equity.

METHODOLOGICAL FRAMEWORK FOR REVIEW

Systematic reviews and meta-analyses are a key element of evidence-based literature, yet they remain in some ways mysterious. A review earns the adjective systematic if it is based on a clearly formulated question, identifies relevant studies, appraises their quality and summarizes the evidence by use of explicit methodology. It is the explicit and systematic approach that distinguishes systematic reviews from traditional reviews and commentaries. Whenever we use the term *review* in this paper it will mean a *systematic review*. Reviews should never be done in any other way (Med, 2003). Keeping in view the major thematic area and objectives, the review of literature was done.

Methodological Framework for Review of Literature consists of the following steps

- Fix the major area of work
- Determination of problem
- Search of literature
- Review of Context, Concept, Methodology, Theory and Evidences
- Analysis and interpretation
- Documentation

RESULT OF SYNTHESIS

Definition of Family Farming: Flashlight on the earlier research

From the studies of eminent social workers and scholars like; Craswell (1998), Das (2013) it has been found that The concept of 'Family Farming' broadly refers to a special character of the farms which are sustained on the involvement of the family members with less dependence on high external inputs. Ever since the small farms depend on the family members and it created a tradition and culture of farming.

From the studies of Das (2013), a researcher can get a clear line map of the context. On the last of 60s' when world was suffering from prolong and frequent hunger and food crisis. As we could no longer expand our production areas, the challenge was to increase the productivity to feed the fast growing population. The traditional agricultural systems were failing us. We needed to modernize our agriculture and we needed new technologies – as we were told. Green Revolution ushered in with the promise of giving us more food with promises of hiking up the productivity. It did so. World's food stores swelled over the next few decades. Whether that food reached our starved and half-starved countrymen, is a different story. Now, the modern technologies too seem to be failing us. Our rich agricultural crop diversity is wiped off, thanks to the handful of high yielding and improved crop varieties that now sway in our farmlands. Those who are left are threatened by GM crops. Rampant use of chemical fertilizers has led to the death of soil.

Hence, it can be concluded that it was the cause for which a paradigm shift is advocated for food production in the concept of low cost organic farming which is embedded in the principles of productivity in perpetuity without associated ecological or social harm. Side by side, farming system approach is now becoming prior concern. Collinson (2000) in his study cites FAO (1997): ''Farming System (FS) tries to look deeper into this crisis, particularly of the small family farms falling in between the modern and primitive production systems. The Farming System approach that evolved was based on the notion that: one had to begin with understanding the problems of farmers from the perspectives of farmers; and that solutions had to be based on a proper understanding of their objectives and their environments, including both biophysical and socioeconomic components''.

Comprehensive review of the past research studies is an essential component of any research endeavour, the major function of the review of literature is to get acquainted with various aspects of the term- 'Family Farming'. Some of the relevant studies which have been reviewed and analysed in line with theme of definition are given in logical order.

From the various articles it is clear that the definition of 'Family Farming' considers- 1) Labour utilization pattern in farm, 2) Family ownership of land over generations and 3) Farm integration with local community.

Bélièreset. al (2015) elucidates family farm as the ''forms of organisation of agricultural production and includes holdings that are characterised by organic links between the family and the production unit and by the mobilisation of family labour, excluding permanent employees. These links are reflected in the inclusion of the productive capital in the family assets and in the combination of domestic and market and non-market operating logics in processes to assign family labour and for its remuneration, as well as in choices for the distribution of products between final consumption, intermediate consumption, investments and accumulation''.

Aspects of the evolution of Family Farms

Illustrating this in respect to the history of family farming, Kesavan and Swaminathan (2014) cited an article, written by Hladik (2012). In that article he fabricated the complex procedure of food production at family farm and the way to serve the farm produces in family dining. Kesavan and Swaminathan (2014) also cited some chronological data, representing the emergence of family farms.

Mazyer and Roudart (2012) explained the history: if humankind somehow managed to permit each developed biological system of the planet to lie neglected, each would rapidly come back to a condition of nature near that in which it existed 10,000 years ago. Wild vegetation far more grounded than those current today would overpower developed plants and tamed creatures. Nine-tenths of the human populace would die in light of the fact that, in this Garden of Eden, basic predation (chasing, angling, and social occasion) would surely not sustain more than 500 million individuals. In the event that such a "natural calamity" was to happen, industry would be of little help, since it is not yet in a position to integrate nourishment for mankind on a huge scale, and won't have the capacity to do as such rapidly. Alongside these literatures, however, interpretation was made to analyse the history of the family farms.

CONCLUSION

Sustainability is essentially a social construct which can be interpreted in different ways by various groups in society. Ultimately, the components of managed ecosystems like farms need to function in such a way that productivity is maintained or enhanced over the long-term without the depletion of the natural resources (Scot et al, 2000). Daly (1973) had listed few general principles of sustainable development. According to him the main principle was to limit the human scale to a level, which is within the carrying capacity of the environment. Secondly, technological progress should be throughout efficiency measuring rather than throughout quantity increasing. Renewable resources should be exploited at a profit maximizing sustainable yield basis and in general not be driven to extinction, was the third principle. Lastly, for non-renewable resources, rate of depletion should not exceed rate of creation of renewable substitutes. Besides these market failure related to resource pricing and property rights should be created. Peet (1992) suggested that economic imperialism, ecological reductionism, and the economy as a steady state subsystem are three reasonably well-known strategies for integrating economics and ecology in the context of policy making in field of sustainable development. It reflects the biophysical system view of ecosystem as self-contained dose system needing only energy from the sun to produce the material requirement of the economy. A policy of sustainable development should be like one that seeks to promote efficiency.

ABSTRACT

For centuries, tribes of Chotanagpur plateau region have stayed in geographical isolation, have maintained their distinctive culture of farming, have sustained on subsistence family farms, and struggled to overcome poor socio-economic condition.This study highlights the family farms of tribal farmers in East Singhbhum district of Jharkhand.The study also considered the gender based productive dimension in farms. Productive dimension involves major activities like; Land Preparation, Seed Cleaning, Sowing and Transplanting, Intercultural Operation, Harvesting, Post Harvesting, Cattle Management, Milking. Keeping aside the aspects of the research problem, the perspectives of the methodology were inferred and identified. The research was construct chiefly with respect to Ex-post facto explore outline. As needs be, after an exhaustive and important detailing of the issues, particular targets were chosen. In the light of these goals, an exertion was made to make a careful audit of the applicable writing identifying with the past inquiries about in this field. Targets were given in the presentation part. This study is an amalgamation of descriptive research, correlational study and exploratory research.Finally, the study suggests some measure related to the problems and constraints of family farms.

Key words: Family Farm, Participatory Research, Participatory Rural Appraisal, FGD, Case Study, Jharkhand, Gender Dynamics.

INTRODUCTION

Work division of women and men in a farm fundamentally rotate around land and related assets. Notwithstanding these exercises each family unit requires the execution of a base measure of housework for carrying on its day to day exercises. The family unit constitutes a fundamental unit of creation in all such social orders where agrarian generation depends completely on utilization of family work (Sethi, 1991). The engrossment of farm members in farm based actions which are often discussed under the light of gender dominated domain undoubtedly discusses the role of counter gender. In a family based farm, the role of farm dwellers varies with their gender. But usually women are considered as the passive resources for the farm. As a matter of fact, it is not true. Women are the integral part of a Family based Farm. Over the last two decades, research articles explored the role of gender in farm activities. Goswami and Borodoloi (2013) described the situation as indicated by the NSSO information, in 2004-05, in country regions around 83 percent farm women were occupied with horticulture, either as cultivators or as workers, when contrasted with 63 percent of male farmers. Despite the fact that a huge extent of the rustic labourers is occupied with horticulture, yet they can get work for just a couple of months of the year.

Beyond the household activities, gender role in agriculture sector was highlighted by Singh (1980). He conducted his study at Panjab, India. He illustrated the role of women in agriculture: female interest in monetary action in the rustic ranges in the Punjab is firmly associated with land possession. Landowning individuals in the Punjab despite the fact that they claim little parcels, consider it underneath their poise to enable their ladies to work outside the home. They wouldn't fret ladies taking a shot at their own homesteads however they don't endorse working in the ranches of others. Creator presumed that there is nearly more financial improvement in Punjab however this advancement appears to be somewhat cut sided. Inside farming there is more prominent weight on sustenance grains than on business crops, in light of this there are not really any agro-based ventures in country ranges where ladies can take an interest in more numbers.

Rueben (1977) in his article, explained the extent of gender role, faced problems faced by the women in agriculture etc. were highlighted. Along with this, he propounded a framework equipped for representing the female's wage rate, male's wage rate and the nearness of kids as factors that decide the designation of time as between relaxation, home generation and market work. Samrit et al (1991) conducted a study at Bhadra district of Maharashtra. This study investigates the gender dimension vis-à-vis role of women in farms. Some major farming practices, preparation of organic manures and treatment of sick cattle, maintaining nursery, transplanting, were examined. It was found that these types of farm activities were extensively done by the women farmers. The study was conducted at the villages of Assam. The main factor of this study was to examine the role of women in paddy cultivation. In general, it was found that age, land-holding, herd size and socioeconomic status were directly related to the gender role in farms, whereas family size or type had most significant relationship (Siddiqui and Pathak, 1991). Hajiloo et al. (2007) esteem the part of rural women facilitators in enhancing the cooperation of provincial women and attest that rural women facilitators are pioneers who have solid communication with other women in the town and connection indigenous information with present day learning. Provincial ladies facilitators' fundamental part is in limit working for enhancing rustic ladies cooperation and confidence. Rimavi (2011) revealed that support of rural women who are the head of family unit is not as much as female from male-headed families. In addition, there is a noteworthy connection between ranch estimate and rural women investment in extension services.

METHODOLOGY

This study is an amalgamation of descriptive research, correlational study and exploratory research.This study is a blending of structured and unstructured approach.

Sample size: 270 samples were drawn by using Multistage Purposive Sampling.

Sampling Design: From the district, 3 blocks having >60% tribal population had been selected. Thereafter, 3 villages were selected from each block. After that, 30 farmers were selected from each village.

Selection of the study area

4. **Selection of the district:** Jharkhand is comprised of 27 districts. Out of this one district namely East Singhbhum was conveniently selected for the present study.
5. **Selection of the block:** There are 11 blocks in Deoghar district. Out of these 11 blocks, three blocks namely Ghatshila, Patamda and Baharagora block were purposively selected for the study.
6. **Selection of village:** Darisai, Bodhpur and Bhamradih villages of Ghatshila block, Dongagarh, Dhatkidih and Loraidoongri villages of Patamda block, Jarabani, Pochakhuli and Satpati villages of Bharagora block were selected.

RESULTS AND DISCUSSION

The gender influence in determining farm sustainability has not only been integral part but in recent past, it is the prior concern of farming research. To synthesize the gender role in agriculture, present researcher adopted 'Harvard Analytical Framework' (1985).

The 'Harvard Analytical Framework' is a network (otherwise called a 'matrix') for gathering information at the smaller scale level (i.e., at the group and family unit level). It is a helpful method for sorting out data and can be adjusted to numerous situations. The Harvard Analytical Framework has four primary segments (March, Smyth and Mukhopadhyay, 2005). They also expressed the feature of the instrument: This instrument recognizes all pertinent profitable and conception undertakings and answers the question: who does what?

Table 1 summarizes gender role in Family Farm. By using 'Stone Weightage' method, sex wise farm job distribution had been tried to understand. In this method, each of the respondents was asked to provide points against each combination of activity (Age/ Sex vs. Activity). The points should be given out of hundred. To make the procedure easy, hundred stones were used. After that, points were converted into percentage and ratio.

Productive Dimension involves major activities like; Land Preparation, Seed Cleaning, Sowing and Transplanting, Intercultural Operation, Harvesting, Post Harvesting, Cattle Management, Milking. It is noted that women involvement was equal in Sowing and Transplanting, Harvesting and Post Harvesting activities. Therefore, it can be inferred that Agricultural activities are both male and female centric, while allied activities are female centric. Along with this, gender role in reproductive dimension is also represented here.

Gender based access and control profile of Family Farms

Collected data describes the connection to gender based access to various resources of the family farms. The researcher used 'Harvard Tool' to analyse the gender role in family farms which is presented through the table underneath.

It is important to inspect which men and which women had access and control, and to ask what was really implied by get to and control for each case. (March, Smyth and Mukhopadhyay, 2005). Such inquiries for this research work would uncover the accompanying subtle elements.

Comments on the findings

Women of the study area marked significant influences and contribution to produce various crops. In the study area, they were involved in crop production, up to 60% of main crops for both the family consumption and market sale. The female candidates of the farms had access to land and crops, but rather the consequence of no control over input and market information. However, women had minimal access to the crop production and yield, while the control over these resources was made certain by male counterparts. In kitchen gardens, farm women were involved in vegetable productions that were essential to ensure food security. Farm women used to take part in nursery

management and harvesting. Women and their access on seed, market and land advances were likewise influenced by the people/ gender that had control and eventually possessed the yield. It is clear from FGD that men had access and control over seed, market and land. Female candidates of the families used to look after the animals. As discussed earlier, most of the reproductive activities like- Cow shed cleaning, Preparation of feed, providing water, poultry shed cleaning, collection of eggs and sale of products to neighbours were done by female members of the farms. Even though all male members of the families were not too much involved in livestock management, gender discrimination was prevailing in the decision making process regarding selling of those animals. Hence; it was found from discussion that the control over livestock was also secured by the male dwellers of the farm families.

Female dwellers of family farms were restricted to take decisions regarding off farm and community participation related issues. Almost in all walks of life, all over the place, women had prior responsibilities regarding household maintenance. Gender dynamics were prominently observed in this issue. Though women had access on the house hold and off farm facets, they did not have any access on those resources. While extension service related facets were controlled and accessed by the male and female both. It was happening because of the impact of mass sensitization which was ensured by several institutions working in the study area.

Gender based power-resource inclusion in extension services

Zimmermann and Maennling (2007) propounded this method to analyze the gender based resource insclusion in extension services. There was a boundless view that in execution arranged associations, honest to goodness power was alloted exclusively on the premise of mastery or authority abilities; in any case, this conviction was incorrect. In all institutions and extension agencies, power and control were manipulated in ways which were particular to the institution; they might likewise be legitimized by social institutions. People's own particular declarations about the premise of their position of energy were regularly enlightening and might incorporate cause, gender role and dynamics, age, property, impact, experience, learning, social and commonsense abilities.

In a family farm, male and female were acted as the major actors to ensure the allocation of power resource allocation. Figure 2 reveals the power-resource allocation pattern in extension services in terms of gender dynamics.

Comments on the findings

IN- Information

As because- male counterpart of the family had more control over the sources of information, content and information flow, hence; they had more influence on information dissemination. According to Zimmermann and Maennling (2007), power often derives from the control of information. Thus; it was clear from the result that male members of the families had more power which ensured better inclusion of information (from their part) in extension service system.

CN- Communication and negotiating power

According to Zimmermann and Maennling (2007), the basic facet of CN is- the ability to get a handle on the core of the issue and to impart unmistakably and briefly, passing on an intelligent message, inducing others and accordingly declaring one's own advantages. The study revealed that male member of family based farmers were able to grasp an information better than their counter parts. As they had more power to control and access the information sources, hence; they could convey the message easily. While female members had less power to control the information resurces which hindered the process of communication and nigotiating power.

KE- Specialist knowledge and expertise

Male dwellers of the family farms had more exposure and mobility. They had a societal power to dominate. It resulted to create a situation where they could avail more specialized knowledge and expertise rather than the women members of the family. As a matter of fact, women were unable to possess more power on specialist knowledge and expertise.

PR- Practical relevence

According to Zimmermann and Maennling (2007), control that emerges from educated aptitudes and encounter and is communicated in the capacity to take care of handy issues and in this manner realize change.From the study it was found that female dwellers had better performance in regards to PR. Female dwellers of farms who got exposure/ skill development training from voluntary organizations, were able to solve the real life situation/ problem.

CR- Creativity

Practical relelevance created vibration in the mode of expression. Hence; female respondents performed better in regards to employ facts in such a way that they were able to fabricate new thoughts and solutions. Hence, they had a better performance in this regards. Zimmermann and Maennling (2007) defined the fact: Control and power emerging from the capacity and aptitudes to use information and involvement such that they produce new thoughts, ideas and arrangements and give an inventive perspective of existing frameworks.

SR- Social Relationship

Zimmermann and Maennling (2007) defined: SR is the power which got from involvement of a social group, class, peer group and so on and defended by relations with different partners. From the study it was found that male dwellers had better performance in regards to SR. Male dwellers of farms had more exposure and mobility. Control and access to social groups generated a power of social relationship which had a clear influence on their farm.

Gender role in decision making

Without dynamic support of women and consolidation of female points of view at all levels of basic leadership, the objectives of equal improvement and peace can't be accomplished (Karl, 1995). Several reviews revealed that so as to build the part of female dwellers of farms in decision making for agriculture and allied sectors, it is important to document the gender role in farm decision making.

Ranking method of PRA was adopted to realize the gender role in decision making. It compares various criterions, based on gender role. The participants of PRA provided their choice against each criterion based on the discussion with other community members.

Major steps in the course of making 'the multiple ranking methods' encompassed of:

- Segregation of participants according to their Family Farm type
- Identification of the major farm and non-farm activities
- FGD on gender role.
- Preparation of matrix table.
- Voting against each criterion (by the participants).
- Collection of data from each village.
- Preparation of 'Cumulative table' for each type of Family farm.
- Analysing the responsible factors.

Table 3 were the outputs of PRA exercise. These tables provide a visualization of gender role in farm related decision making. However, raw tables of village level PRA data are not presented here. These tables are the 'Cumulative Tables', prepared on the basis of raw data.

It was revealed that farm women had taken part in various sorts of farm related decisions; however in a few perspectives their rights to settle on farm related decision making were smothered by the predominance of men.

Women's involvement in decision making regarding farm related activities like - deciding area to be sown under different crops , selection of new crop variety, labour hiring, selling of agricultural products were quite low or nil. In case of Farming System II and V, there was weaker gender participation in regards to 'deciding area to be sown under different crops'. But in other cases, it was nil. Crop related decisions were strongly taken by the males. Women

adults were generally not involved in the decisions related to use of fertilizer, labour hiring, and borrowing money. They had strong opinion regarding selection of feeds of animal. But marketing of the animals/ animal products were not their responsibility. They did not get the power to express their opinions regarding this issue also.

Constraints experienced by the women in operationalizing the family farms

In spite of the fact that ladies are assuming an indispensable part in little scale horticulture, yet different elements are influencing country ladies contributions in family cultivating. The beneficial and conceptive parts of females in the public arena, named as "double day" parts, brings about a heavier workload for females than guys, in spite of the fact that this likewise relies on upon social class, age or ethnicity assemble (Peter, 2006). However, since inception women's role in agriculture and economy has often been underestimated, and their involvement in agriculture has been invisible. Women's wide range of domestic activities, vast extent of family care, and immense involvement in cultural activities often create a shadow over their involvement in agriculture. Hence, highlight on 'constraintsexperienced by the women in operationalizing the family farms'- is getting impetus in the context of farming, not only in family farming but also in common perspective of whole agriculture. Constraints faced by farm women in their involvement in family farming were identified and presented in Fig 3.

Problem Tree is a type of diagram, mostly deals with cause-effect relationship of a problem. Constraints faced by the women during farming, are represented visually by using an outline/sketch of a tree. Major constraints are depicted through the stems of the tree. While roots of the tree represent the causes/ factors responsible for the constraints.

Using brainstorm technique respondents/ participants addressed the major constraints (like; difficult to spend time for farm operation, less involvement in farm related decision making, poor skill and knowledge etc.). Thereafter, outline of a tree was drawn by the community members on the ground with a stick. After that, causes of the constraints were identified. Attached diagram is a replica of original one. From Figure 3 it is reflected that lack of training and less exposure were the factors responsible for the constraint, pointed as 'poor skill and knowledge'. While 'lack of self-reliance', 'male dominance', 'cultural norms' and 'illiteracy' were responsible for 'less involvement in farm related decision making'.

CONCLUSION

The study also considered the gender based productive dimension in farms. Productive dimension involves major activities like; Land Preparation, Seed Cleaning, Sowing and Transplanting, Intercultural Operation, Harvesting, Post Harvesting, Cattle Management, Milking. It is noted that women involvement was equal in Sowing and Transplanting, Harvesting and Post Harvesting activities. As because- male counterpart of the family had more control over the sources of information, content and information flow, hence; they had more influence on information dissemination and decision making.

To ensure women's role in decision making, access to the resources of family farms should be the basic concern. Along with this, their access to knowledge and farm related training programmes should be increased. The constrained introduction to data sources restricts the information of farm women about most recent improvements in farm enterprises. Farm women were not effectively included in the exercises of different associations which give data about the farm innovation and improvements, and the majority of the women didn't know of the formative plans implied for their improvement. Hence, their liaison with the institutions should be ensured. The extension professionals ought to tell the individuals from SHG the agriculture credit and crop insurance for the assurance of life, property and obligation. Government had begun different farmers' protection plans for the advantages of dwellers of farm families. These plans ought to be highlighted to them. It ought to appreciate change and strengthening of farm women through state of mind change, inclination advancement, social cognizance and asset era. The imperatives of strengthening ought to be maintained a strategic distance from viably by creating certainty, dispersal of information and choosing the need for empowering women. Just dissemination or dispensing of Government fund does not help poor. The officers ought to approach to guide them how to utilize the funds and

assets viably and ensure empowerment through SHG. Vocational training along with mass sensitization will go a long way in improving the status and participation of farm women in agriculture and allied sectors.

ABSTRACT

The plateau of Jharkhand is not only popular because of abundance of mineral resources but also popular as it is the dwelling place of various tribes. Mainly 'Protoaustraloid' tribes are sprung from the earth of Jharkhand. They have their own lifestyle and culture. Their lives and livelihoods are mostly dependent upon nature and natural resources. There is a reciprocal relationship between nature and the tribes. Indigenous people still practice some cultural and ethnical linkages between social and biophysical ecosystem. Sacred groves are that kind of inextricable linkages between man and nature. Basically these are the tracts of virgin forests or the patches conserved by the local people for centuries and these are not merely a tradition but it is the way of life which for centuries has been shaped the relationship between man and its instinct to conserve the nature. The paper is the modest endeavor to highlight that the tradition of sacred groves could be an important tool to ensure natural resource conservation through community participation. The study was conducted with one of 29 groves of Palamu district of Jharkhand. *'Jaherthan'*s of the 'Santals' are selected as the groves. Qualitative approach has been adopted for the study. 'Participatory Rural Appraisal' is the integral part of this research work. The study was analyzed the management process with focusing on the utilization of biomass, source of conflict and it's resolution process, penalty process etc.and the lessons can be learned from such traditional initiatives in the broader context of the present policies related to natural resource conservation.

Keywords: Community Participation,Conservation, Jharkhand, , Natural resources, Sacred groves, Santal, Tribes.

INTRODUCTION

Since time immoral indigenous people are the protectors of the nature and natural resources. They have an unmediated relationship with nature. The traditional worship, ritual and practices symbolize the symbiotic relationship between these indigenous communities and nature. Indigenous people all over the world reside in harmony with the nature and conserved its valuable biodiversity.Seeland (1997) opines that human, for various needs, ranging from economic to belief system has utilized natural resources, which have been gradually integrated and incorporated in the social system of human beings by means of various institutional procedures. The economically developed world as well as some of the underdeveloped economies still depend on their own and the world's forest for survival, yet in different ways and meanings. Kala (2010) stated that the harmony between nature and human resource still exists. The indigenous people are still practicing their traditional culture linking with their social and biophysical ecosystem. Based on their traditional knowledge they maintain the diversity and productivity among the surrounding environmental condition. However, Khan, Khumbongmayun and Tripathi (2009) mean to ventilate that in course of time, science and innovation created and ventures were built up and extended to satisfy the expanding needs of the individuals. Different anthropogenic exercises have adjusted the structure and capacity of various environments everywhere throughout the world. One of the most prominent impacts of biological system annoyance has been the exhaustion of biodiversity. Vanishing of species because of natural surroundings adjustment, over exploitation, contamination, worldwide environmental change and intrusion of fascinating species is quick to such an extent that numerous significant taxa may evaporate even before they are recognized and their scientific worth is found. Indeed, even Kala (2007) raised his voice: The need of natural resources for human endurance had made them to advance a framework having some standard laws and practices, which in since quite a while ago run may assist with rationing the encompassing natural resources. Religion, being a ground-breaking instrument for persuading individuals, has consistently been utilized for meeting the ideal destinations of the society. The different righteous philosophies have contributed fundamentally in the protection of woods, biodiversity and scenes by proclaiming customary rules, practices and convictions. Be that as it may, with the appearance of business interests in the woods and biodiversity, in many parts of the world, the indigenous way of thinking and works on including righteous methodology received by the neighborhood networks for preservation of biodiversity have commonly neglected.

Jojo (2003) opined that after independence, capital intensive establishments were considered as *modern temples* of India. Baxi (2008) has been shown that no development without displacement became the *mantra* of developers everywhere. The tribal communities generally dependent on Forest- Hunting, Hill Cultivation, Plain Agriculture, Simple artisan and Folk Art etc. Due to urbanization, many of the tribal are migrating to different industrial belts and towns. Nature and natural resources are now treated as the 'Passive Resources'. It is because of industrialization, urbanization and its natural consequences. Expansion of urban areas and deforestation is goingg on parallely. Conservation and sustainable management of natural resources has become cef/ntral theme for almost all societies in order to meet shortages in timber or non-timber forest produce and overcome the impact of environmental pollution. Financial development in the midst of expanding ecological dangers will in general make a difficulty in numerous social orders which will undoubtedly develop in spite of the regularly restricted confinements of declining asset base (Seeland and Schmithusen, 2000). Numerous territories have been proclaimed as ensured regions and different in-situ and ex-situ preservation practices have additionally been attempted in various parts of the world. Numerous laws administering the biodiversity protection have additionally been authorized every once in a while including "The Biological Diversity Act 2002" ordered by the Govt. of India. Other than these proper laws, there were numerous customary preservation practices of indigenous societies in numerous segment of the world, which added to the preservation and assurance of biodiversity. A genuine case of such customary practices is the preservation and assurance of small woodland fixes by committing them to the neighborhood gods by different indigenous societies of the world. Such woods patches are designated "sacred groves" (Khan, Khumbongmayun and Tripathi, 2009).

These indigenous people utilize the natural resources of a given region over generations and quite expect that these resources would secure their future generation. This probably paved way emergence of different cultural institutions and rituals to ensure the sustainability of the natural resources. This may be the basic truth lies behind the emergence of 'Sacred Groves'. Sacred groves are that kind of inextricable linkages between man and nature. Basically these are the tracts of virgin forests or the patches conserved by the local people for centuries and these are not merely a tradition but it is the way of life which for centuries has been shaped the relationship between man and its instinct to conserve the nature.

Gaikwad, Paralikar, Chavan and Krishnan (2004) portrays Sacred Groves as a deep rooted convention where a fix of backwoods or water body is devoted to nearby divinities and none is permitted to slice plants or to massacre creatures or any type of life.

While Buchman (1992) highlights that that the tradition of sacred groves could be an important tool to ensure natural resource conservation: sacred grove contains a large number of species and is considered to be a true ecological jewel. This territory harbors an immense wealth of biological and genetic diversity and provides safety to endangered animal and plant species and probably constitutes only representation of forest in its virgin condition'.
The plateau of Jharkhand is not only popular because of abundance of mineral resources but also popular as it is the dwelling place of various tribes. Mainly 'Protoaustraloid' tribes are sprung from the earth of Chotanagpur plateau. They have their own ligfestyle and culture. Their lives and livelihoods were mostly dependent upon nature and natural resources. There was a reciprocal relationship between nature and the tribes. The paper is the modest endeavor to highlight that the tradition of sacred groves in Jharkhand could be an important tool to ensure natural resource conservation through community participation.

Objectives of the study

Keeping the aforesaid objectives in view and looking atthe tradition of sacred groves at Palamu district of Jharkhand, the study was conducted with some specific objective:
To understand the community's perception about the tradition and natural resource conservation
The empirical study was conducted with a broader objective: *Acquired lessons can be learned from such traditional initiatives in the broader context of the present policies related to natural resource conservation.*

Research design

The present study is a descriptive one. The study is also based on participation based Ex- post facto research design. Based on the research problems, specific objectives were decided. Basically based on review of literature, the problem and related issues were understood. After that, the process of data collection was started.

Locale of the study area: The present study was conducted at the picturesque hamlet ofGhanseeTola of Palalmu district of Jharkhand, India.

Sample size (n) of the study was 60 from 20Santal families, nearer to the Sacred Grove locations i.e. 3 from each family. The respondents were divided according to their age and sex (Middle aged male and female, Youth and Aged persons).In order to select the sample, purposive sampling was done.

The methods of data collection were qualitative in nature and were aimed to seek answers to certain research questions which would be deducted from various studies, researches and also during the field study. Given below is a list of the major techniques of data collection utilized by theResearcher-author for the present study:*Interview, Observation (Participant Observation and Non-Participant Observation), Focused Group Discussion (FGD) and Participatory Rural Appraisal (PRA).*

The findings of this study had been discussed after analysis of the collected data and were subsequently summarized. The conclusion and the suggestions were aiming to bring desired positive contribution to the natural resource management.

RESULT AND DISCUSSION

As a rule,Santals go around their nearby indigenous divinities. Santals arrange their righteous function at the hallowed place 'Jaherthan'. It is situated in the center of the woodland. It might be the border of the village.

A number (30-35) of Sal trees (*Shoriarobusta)* are the integral part of '*Jaherthan*'. Three trees are essential and they must be in a row. At the base of each of these three trees sacred stone is placed which symbolizes the deities Jaher era, Marang BuruTrukoand Muruko. Near those three Sal trees and a stone is put on an Asan tree**'s** base representing the deity ParganaBonga. There is also a Mahua tree (*Madhucaindica*); on its base, a stone representing the deity Gosain (Lady of the grove) era is present there.

The village dwellers themselves maintained the sacred groves with a great passion and sanctity. The traditional institu mechanisms have been helping the local people in maintaining the sacred place '*Jaherthan/ SarhuliMandir'*. The 'Jaher' has given the duty to the KudumNaike (priest) to oversee and prayer the village divinity in holy forests. There were a few traditions and social practices related with assortment and for the most part there was no limitation on the assortment of the products, anyway the nearby individuals feared assortment from the sacred forests. There was a general conviction that since holy forests were holy, the finders may be rebuffed by spirits and gods for unapproved assortment of natural resources, however all gods were not viewed as perilous.A c onviction was additionally connected with the old tree species that old trees in hallowed woods for the most part the frequent of malevolence spirits, and as old as the tree, more noteworthy the odds of shrewdness spirits to possess. The nearby individuals dreaded to go to such places, even in the early afternoon and evening. Youngsters and pregnant ladies were not permitted to visit such places. This kind of conviction assists with shielding from the everlasting greediness of individuals.

Seasonal Festival Calendar: Seasonal Festival Calendar, obtained from PRA, is redrawn here from the original to make it visible, as the hazy photo copy of the main sheet may not be properly understandable.

The calendar clearly depicts the festival seasonality. '*KudumNaike'* is the priest of the community. Annual Important rituals and Festivals showing their relation with Agricultural

It is commended to feel the delight of reaping crops. Pigs, eggs, fowls and goats are offered by the village Naeke (priest) in the Jaherthan (holy woods).

Baha is celebrated in the month of Feb.-March *(Phagun).* The first fruits of *Matkom(bassialatifolia)* and other wild fruits and flowers, mainly the S*arjom (shorearobusta)* flower arebeing offered. The N*aeke*and the K*udamnaeke*offer sacrifices of fowls at sacred grove in honourof *Maran Buru, Jaher Era* and *Moreko-Turuiko*.***Erok Sim*** is celebrated in the month of *Ashar*(June-July). Sowing of rice seeds in the field.The *naeke*sacrifices the fowls to the J*aherbonga*sand the M*anjhibonga*, invoking each one ofthem to make the earth fertile.***Hariar Sim*** is celebrated in the month of *San* (July-August). It is the time when the Paddyseeds start Sprouting. The *naeke*sacrifices fowls to the village *bongas*, namely *Maran Buru,Jaher Era, Gosae Era, and Moreko-Turuiko, Parganabonga, Manjhibonga*and *Simabongas*for a luxuriant growth of paddy. *Iri-GundliNawai*is celebrated in the month of *Bhador*(Sept.-Oct.). The first fruits of the millet*iri*(*panicummillaceum*) and *gundli*(*panicumfrumentaceum*) are offered to the *bongas*.The*kudamnaeke*along with the fruits of the millet offers sacrifices of goat or ram to the *parganabonga*to protect their crops from rats or other pestilence. *Jantharis celebrated in the month of Aghar*(Nov.-Dec.), the first fruits of the winter rice crop offering. The *kudamnaeke*offers sacrifice of goat or ram to the *parganabonga*along with the first ears of paddy to protect from stomach disease, to multiply the paddy and also to protect their grains from harm. ***Magh Sim*** is celebrated in the month of *Magh*(Jan.-Feb.), when the *sauri*(thatching grass) is being cut.Fowls are sacrificed by the *naeke*to the village *bongas*, invoking them to multiply their *sauri*crop.

Conservation of Nature: Myth of the Goddess of the Sacred Grove: The *JaherEra*is the Lady of the Sacred Grove (*jaherthan*) over which she presides. There is no idol of *Jaher Era*. She is considered to be the benevolent spirit who tends the other spirits at the *Jaherthan*and look after the interest of the village and never does any harm but is

mainly concerned with their bodily needs. She is usually worshiped at all festivals for the general welfare of the village, especially for obtaining good crops and for the health of the villagers and their cattle.

Sacred Grove Resource Map: It shows 'spatial dimensions' of natural resources available in the Sacred Grove. It is important to allow enough room (on the ground) to show common sources and plant diversities and some distance away from it. People may forget to show certain resources on the map, in which case it will need to be revised: thus, a copy of it should not be made until the discussion has been completed. The whole map was drawn by the respondents. The Sacred Grove Resource Map obtained from PRA, is redrawn here from the original to make it visible, as the hazy photo copy of the main sheet may not be properly understandable. The Map reveals:A number (30-35) of Sal trees (*Shoriarobusta)* are the integral part of '*Jaherthan*'.

Three trees are essential and they must be in a row. At the base of each of these three trees sacred stone is placed which symbolizes the deities Jaher era, Marang Buru Truko and Muruko. Near those three Sal trees and a stone is put on an Asan tree's base representing the deity ParganaBonga. There is also a Mahua tree (*Madhucaindica*); on its base, a stone representing the deity Gosain (Lady of the grove) era is present there.

Along with this, the Sacred Grove is the rich source of Ethno-Medicinal Plants like; Latapalas (*Butea superba*), Kalmegh (*Andrographispaniculata*), Bandar Lathi (*Cassia fistula*) etc.

Impact Chain/ Pathway (Community Perception): The Impact Chain/Pathwayis a flow diagram, commonly used to identify and depict the impact of an activity, intervention or event. Impact Diagram not only captures the planned changes, but also takes into account other types of changes as perceived by the local people. The impact can be positive and negative and planned or unplanned. In fact, the Impact Diagram made by the local people generally portrays effects that outsiders would never have been able to think of. Impact Diagram has been used for various purposes including:

1. Identification of impact, intended and unintended as well as positive or negative.
2. Understandings inter linkages between various effects.
3. Discussion of impact, leading to an understanding of reasons for change.
4. Planning how to control and minimize the negative impact.
5. Assessing the impact of various interventions.

This impact pathway will depict the impact of Sacred Grove on the local community.

The whole map was drawn by the respondents. The impact pathway of Sacred Grove, is redrawn here from the original to make it visible, as the hazy photo copy of the main sheet may not be properly understandable.

From this impact chain it can be opined that traditional rules often prohibit the felling of trees and the killing of animals, except in special cases do allow collection medicinal plants by local people (only through the *Naike*s)

Challenges to maintain the Sacred Grove: To get their perception about the challenges, faced by them to protect or maintain the tradition of the sacred groves, adoption of another PRA tool i.e. 'Problem Ranking throughMatrix Scoring method' was done.

Here people firstly selected the challenges, there after the ranking procedure started. The table shows, people realizes that the forest/ sacred grove is in danger and basic reasons behind this are: 1. Degradation of forest and 2. Lacuna in maintenance of the sacred groves. They pointed out that it is because of human activities. They claimed that urbanization has a huge impact on it. There after they pointed out a basic human instinct i.e. greediness. Like this way they analyze their own situation.

ABSTRACT

'Women Empowerment' has been now an important phrase of discussion for the social scientists. The concept of 'Empowerment' was firstly highlighted by the Political Scientists. Undoubtedly, effective utilization of human potentials and realization of knowledge about him/herself are believed to be the most critical capabilities of individuals. Probably this is the root of 'Empowerment'. The term 'Women Empowerment' symbolizes women's realization about their potentials. On the other hand, SHG approach intends to highlight towards unfolding the potentials of women through group approach, enabling them to help themselves by their own capacity. In spite of this, the condition of women SHGs is in doldrums. This might be quite difficult to generalize the whole scenario. Not because the SHGs are not sustaining but because there are too many success stories, revealed according to various voluntary organizations. The study is a modest endeavor to revisit women SHGs (developed by NGOs) of Deoghar and East Singhbhum districts of Jharkhand. Of the various factors attributed to tribal socio-economic life, family based farming, important feature is gender role. Tribal women in almost all walks of life are sharing responsibilities in domestic as well as economic sector. The study is based on Ex- post facto research design. The methods of data collection were quantitative and qualitative in nature and were aimed to seek answers to certain research questions. Participatory Rural Appraisal and FGDare being the

dominant methods. Keeping a foreside to the main objectives, the study emphasizes on socio-economic, political, entrepreneurial aspects of empowerment. Finally, the study suggests some measure against the problems and constraints of the SHGs.

Key words: SHG, FGD, Women Empowerment, Participatory Rural Appraisal, Jharkhand, Gender Role.

INTRODUCTION

Women Empowerment: 'Women Empowerment' has been now an important phrase of discussion for the social scientists. The concept of 'Empowerment' was firstly highlighted by the Political Scientists. Undoubtedly, effective utilization of human potentials and realization of knowledge about him/herself are believed to be the most critical capabilities of individuals. Probably this is the root of 'Empowerment'. The term 'Women Empowerment' symbolizes women's realization about their potentials.

After independence all round efforts have been made to promote the welfare of the women. Article 15 of Constitution confers the equal rights of both sexes, though the state could make any special provisions for women (Kabeer, 1998). The introduction of English education and the contact with the western nations kindled the rationalistic spirit of the people (Mishra, 2006). Biju, (2006) opined that social differentiation & inequality are universal phenomenon.

According to World Bank, (2001)Since the 1990's women have been identified as key agents of sustainable development and women's equality and empowerment are seen as central to a more holistic approach.

'Feminism of Poverty': Not an illusion: In recent past there has been a trend to analyse poverty in the context of gender issues. The concept of 'Feminism of Poverty' critically linked poverty with women related issues. Now role of women varies from society to society. But 'Feminism of Poverty' often proves that women empowerment is one of the strong weapons to struggle against poverty. Let's check some statistics. A 1992 UN report disclosed that "the number of rural women living in poverty in the developing countries has increased by almost 50% over the past 20 years to an awesome 565 million -- 374 million of them in Asia, and 129 million in Sub-Saharan Africa. ... While poverty among rural men has increased over the last 20 years by 30%, among women it has increased by 48%".

Women in India contribute 89 per cent of the unrecognised sector and it is reality that their participation rate is higher in rural areas. Women responsible for one-third of the labour force of India and 90 per cent of the rural-urban women are unskilled workers. Hence, women empowerment could be a mechanism to pave the way for integrated development. Although, gender discrimination has been banned by the Constitution and women have been guaranteed political equality with men, yet there is a difference between the constitutional rights and the rights enjoyed in reality by women. Even after half a century of independence, barring a few exceptions, women have mostly remained outside the domain of power and political authority.

Bhuyan, (2006) highlighted the issue in different context. He opines that although they constitute about half of the citizen and over the years their participation by way of voting has increased, yet their participation and representation in law making and law implementing bodies are not very satisfactory. No doubt the 73rd and 74th constitutional amendment acts have provided access to women in the decision making process at the grass-root level but their representation in the Parliament and state legislatures is woefully poor. Insecurity does not allow the women leaders to identify leadership at the grass-root level. In politics when a man proposes, they themselves depose. In reality women representatives are ornamental in nature and political consciousness is found lacking among them. They are affected by the caste and class divisions, feudal attitudes, patriarchal nature of the family and village-social, environmental, ethnic, religious separatism and the like. They are members on record only. Allegedly, they are not consulted while taking decision. Thus, women representatives are not free from male dominance in the village administration and no significant change in the power equal is observed in the villages.

SHG: Concept and Context

Indhumati and Palanivelu (2013) stated that Self-Help Groups are increasingly accepted as agent by social changes, development and empowerment among the women. SHG's approach represents a paradigm shift from development toward empowerment. The SHG's are considered as the agents of transformation through the mobilization, organizations, banking in situation and voluntary organizations follow self-help approach to active rural development and empowerment of the women in India. The banking institutions channelize their credit to poor through the SHG's.

Self Help Groups are small homogeneous group of individual members who voluntarily come together and form an association for the purpose of solving their common problems through self-help and mutual help and for achieving a common objective. In most cases SHGs are constituted by persons known to one another and coming from the same village, community or neighbourhood, that is, SHGs are small in size with membership ranging from 10 to 20 are homogeneous (poor, financially weak, same socio-economic background etc.) and have certain pre groups binding factor. These groups start and promote with small saving in a common group-fund and kept in a bank. (Vadivoo and Sekar, 2004).

Research Objectives: With these rationales at the backdrop, the objectives for the study were –

- To analysewomen empowerment in the light of pre and post SHG situation
- To find out the role of institutions in women empowermentthrough SHG
- To trace out major constraints of the SHGs

METHODOLOGY

Research design: The study is based on Ex- post facto research design. The methods of data collection were both quantitative and qualitative in nature and were aimed to seek answers to certain research questions. Participatory Rural Appraisal and FGD are being the dominant methods. Keeping a foreside to the main objectives, the study emphasizes on socio-economic, political, entrepreneurial aspects of empowerment. Participatory approach is adopted to analyse the whole situation.

Locale of the study area: The study was conducted in the selected areas of Patamdablock of East Singhbhumdistrict andDevipur block of Deoghar, Jharkhand.

Sampling procedure: Multistage sampling technique was adopted for the selection of study area and sample respondents for collection of information required for the study.

RESULTS AND DISCUSSION

Women Empowerment: In the light of Pre and Post SHG situation

Social Empowerment: The present study intends to find out the social empowerment of the women, residing at Deoghar and East Singhbhum district on the basis of social empowerment indicators like employment selection freedom, decision making ability, social equity, employment skill, ability to defend themselves and ability to participate in social issues, autonomy in decision making.

Cobweb Diagram: It is a participation wheel, popularly known as evaluation wheel. The method deals with visual representation of perception of the masses to reveal the relative social status of SHG and Non-SHG members. Here 'Cob Web Diagram' has been utilized as an evaluation tool to measure the social empowerment of women in pre and post SHG situation. The empowerment issues were selected on the basis of pre-determined variables.

Firstly the purpose of the PRA exercise was explained. Then participants were requested to provide score against each of the five variables. They agreed to score each of the groups on the five indicators on a five point scale. Scores obtained from separate blocks of Jharkhand, had been transferred into a 'Cobweb Diagram'. Respondents of four blocks have been represented by the four quadrants. These four arms of the diagram are considered as four scales. Performance of each block has been marked using different symbols on the indicators.

The size of the trapezoid thus indicated the empowerment status of women of different blocks on the particular indicator. Thus, bigger the size of the symbolic line (indicator) symbolizes better social empowerment status of the women. Women performed well in skill of problem solving, social status, and selection of employment. Women of Patamda and Musabni (East Singhbhum) are more socially empowered in comparison to other blocks (Deoghar).

Economic Empowerment: Economic empowerment is the ability to access, own and control resources. It can be measured in a variety of ways, using outcome indicators such as income generation, ownership of assets and land, expenditure patterns, degree of participation in paid employment, division of domestic labour and control over financial decision-making.

In post SHG situation, the women respondents were able to meet up financial requirements of family like paying children's fee for school and private tutor, electric bill, medical expenses, household items etc. Some of them were even able to manage regular savings by deciding on priorities heads of expenses. Thus, at times of family need, they were able to contribute from the savings which improved their status and respect in families.

Impact on income: Income is one of the important indicators to investigate the level of living of the members of the society. The data regarding the average house-hold income of beneficiaries was estimated in two point time i.e. 'Pre' and 'Post' SHG situation. Table 2 shows the income of the SHG members before and after joining the SHGs.

Rank Test is applied to test the significance of difference between the annual incomes of SHG members before and after joining SHG in table above.

a. Based on negative ranks

b. Wilcoxon Signed Rank Test

Since the asymptotic significance value is less than 0.05, we reject the null hypothesis that the there is no difference in income before and after joining SHGs. The number negative ranks for Income after Joining SHG – Income before Joining SHG is given in the following table. It is trivial from the table that for all the respondents Income after Joining SHG is higher than Income before Joining SHG.

c. Annual Income Before = Annual Income After

Chi Square Test for Economic Empowerment

The respondents level of empowerment on the basis of their experience as members of the SHG analysed, among them 10 respondents had a low level of empowerment, 156 respondents had a medium level of empowerment and 14 respondents had a high level of empowerment. To evaluate the empowerment of women entrepreneur through Self Help Groups, chi-square test has been used.

The table value of χ^2 at 0.05 level of significance at 6 degrees of freedom was 13.67. As the observed χ^2 value i.e. 83. 67825 is greater than the table value i.e. 13.67, so it can be said that women were economically empowered through SHG. It revealed that the SHG had been successful in providing economic empowerment to their members.

Economic Empowerment in Post SHG situation: Cobweb Diagram: Here 'Cob Web Diagram' has been utilized as an evaluation tool to measure the social empowerment of women in pre and post SHG situation. The empowerment issues were selected on the basis of pre-determined variables.

Firstly the purpose of the PRA exercise was explained. Then participants were requested to provide score against each of the five variables. They agreed to score each of the groups on the five indicators on a five point scale. Scores obtained from separate blocks of Jharkhand, had been transferred into a 'Cobweb Diagram'. Respondents of four blocks have been represented by the four quadrants. These four arms of the diagram are considered as four scales. Performance of each block has been marked using different symbols on the indicators. The size of the trapezoid thus indicated the empowerment status of women of different blocks on the particular indicator. Thus, bigger the size of the symbolic line (indicator) symbolizes better economic empowerment status of the women. Women performed well in Self-financing and saving habit. Women of Patamda and Musabni (East Singhbhum) are more economically empowered in comparison to other blocks (Deoghar).

Psychological Empowerment : Psychological Empowerment involves a sense of autonomy, competence, efficacy, meaningfulness and trust.

Garret's Ranking : clearly depicts that self-employment is the main factor influencing the empowerment of women entrepreneurs through SHGs.

Major findings fromGarret's Ranking: The variable 'Self – Employment' obtained highest score .The least score is awarded to 'Serving the Society'. It is inferred that 'Social Status' and 'Group Domination' are the important factors for the SHG members.

Political Empowerment: Traditionally women were considered a passive worker in the society. Hence, political empowerment is needed to melt the ice. Political empowerment has direct relationship with social empowerment. This dimension considers the issues like- Political Awareness, Protest Power, and Participation in election and Panchayat meetings. Although many aspects have been considered, they do not cover all aspects of political empowerment. Moreover, due to variation in mental and socio-economic conditions, the aspects may vary from society to society. Leadership quality is now considered as the major aspect of political dimension.

After joining SHG, the members' level of awareness in political, educational and legal fields had increased. They were well informed about their local leaders and 25% of the respondents have some knowledge about the Nation's political affairs. Almost all the members even knew the legal age of marriage for boys and girls, dates of election as well as the nominated candidates. From the Figure 2, it is clear that the status of political empowerment became better in post SHG situation. 'Protest to Power' has increased significantly.

Role of institutions in women empowermentthrough SHG:

NGOs are sensitizingprimary stake holders (women) and they could play a significant role in initiating a SHG and also arranging technical skill development programmesfor the SHG members. Women are often able to impart technical knowledge and skill.Some NGOs are also trying to develop marketing chains in the process of establishing on an enterprise by them for more sustainability. If these inputs are not supported strongly then women are least likely to succeed in taking up any income generating activity on a sustainable basis even after having a desire and need for such activity. Based on Focused Group Discussion (FGD) role of NGOs in women empowerment has been highlighted here.

For centuries, women of the nation have stayed in the cave of societal taboos, have maintained their distinctive culture of living, have sustained on their family lives, and now they are struggling to overcome poor socio-economic condition. The women of this nation have stayed outside the realm of the self-motivation and self-reliance. Male dominated society for various needs, ranging from economic to social system has utilized women as the prime unit of child production. These concepts have been gradually integrated and incorporated in the social system of human beings. Domestic activities are often considered as the prime job of women. With innovative ideas and novel approaches, SHGscould be utilized as a change maker and could be a tool to provide better opportunities to the downtrodden. In this context SHGs have evolved some simple but innovative methodologies which could be a lesson to all.Failure stories could be helpful to revitalize the situation. By upholding the banner of Women

empowerment Vis-à-vis the success stories, the project reports of several NGOs, speaks of social, economic and political empowerment of womenthrough SHGs. Undoubtedly the civil society movement got huge success, followed by various entrepreneurial success and intends to highlight the success stories. Since the movement started, a bundle of failure stories are still sinking in the darkness.

ABSTRACT

Family based Farming System as a notion is fundamentally space related, time associated and relation oriented. But then, space related dimensions are intrinsic feature of Farming System Research. Actually, it deals with the consideration and analysis of spatial dimensions of farm and farm families. In its usual format, such an investigation gives elucidation how researcher synthesizes the characteristics of a farm in the light of peoples' veracities.Apart from such observations like; resource flow in a farm, the study intended to ventilate the diversity details of the farms. It can also be asserted that 'Space utilization pattern' of a farm deals with this aspect. In this way, the space utilization dynamics of the studied Family Farms can be synthesized.This study highlights the family farms of tribal farmers in East Singhbhum district of Jharkhand. Characterization of the farm resources and sustainability assessment of those farms are urgently needed, particularly in the context of natural resource management and socio-economic realities. Present study is descriptive in nature. The findings of this study have been discussed after analysis of the collected data through questionnaire and interview of the members of family farms and were subsequently summarized. PRA (Participatory Rural Appraisal) and FGD (Focused Group Discussion)are used here as a predominant methods of data collection. The findings had been summarized after throwing light on all the major aspects of the study. The conclusion and the suggestions were made to make the rural development possible through family farming.

Keywords: Family Farm, Space Utilization Pattern, PRA, FGD

INTRODUCTION

Everybody now consents to the way that expanding populace and land discontinuity will influence human oversaw agricultural frameworks also. Agricultural frameworks, specifically, is helpless against such changes. Since living has turned out to be more astonishing than some time recently, and also influences human need, particularly nourishment propensities, has likewise been moving quickly and among the general population agreement is progressing that by itself cultivating can't meet these developing requests of the general population by harvest development as it were. It needs enhancement with different endeavors in the basic agricultural frameworks to adapt up to this change.

Family farms allude to the homestead where in at least two differing financial actions are coordinated with farm/ agricultural assets for accomplishing their judicial use, acknowledge most extreme benefit and guarantee returns. Along these lines, the essential goal of the Farming System is to enhance quickly the financial states of individual homestead families by expanding change, heightening and expansion of various undertakings and generation wise sustainable methods; keeping in view the most recent advancements, requirements forced by assets, social taboos and the earth. Indian agriculture is not merely an occupation, but it is the way of life which for centuries has been shaped the life and out looks of the nation. It symbolizes peoples' struggle against economic deprivation. For centuries, tribes of this region have stayed in geographical isolation, have maintained their distinctive culture of farming, have sustained on subsistence family farms, and struggled to overcome poor socio-economic condition.Family Farming may be defined as the ''forms of organization of agricultural production and includes holdings that are characterized by organic links between the family and the production unit and by the mobilization of family labour, excluding permanent employees. These links are reflected in the inclusion of the productive capital in the family assets and in the combination of domestic and market and non-market operating logics in processes to assign family labour and for its remuneration, as well as in choices for the distribution of products between final consumption, intermediate consumption, investments and accumulation'' (Bélières et. al, 2015).It is understood that with rising population, declining land-man ratio and dwindling of land and labour productivity, agriculture alone would not able to provide adequate income and employment to households in India. Further, there is hardly any scope for horizontal expansion of land and only vertical expansion is possible by integrating various farm enterprises. Under such circumstances, to ensure a regular flow of income for decent living and to achieve food and nutritional security, farmers have to undertake some land based enterprises which will complement existing farming activity to get more income leading to social and economic upliftment (Behera et al., 2001).A predictable reaction of farming extension and strengthening has been the fracture and disconnection of normal natural surroundings inside an inexorably inadmissible lattice for some species (Donald et al., 2001). Natural surroundings discontinuity and its belongings prompt a scope of environmental and biological system changes. Among these, biodiversity characteristics, for example, species arrangement, group structure, populace elements, conduct, reproducing achievement, and individual wellness are adversely influenced (Silva and Pontes, 2008).Altieri (1987) reported that consequences of biodiversity are nowhere more evident than in the realm of agricultural pest management. Further, it was reported that the instability of agro ecosystems increases with the worsening of most insect pest problems, which is increasingly linked to the expansion of crop monoculture at the expense of the natural vegetation and thereby decreasing local habitat biodiversity. Desai et al. (1995) opined that occupational structure reflects economic sustainability of any region in terms of type of work, level and skill of workers, number of days that workers are employed in work per year, nature of work, full time versus marginal work etc. It is also important to know the level of occupational sustainability of a region, both at a macro and at a micro level, over a period of years in order to ascertain its economic development. Sivananthan and Subramaniam (1995) reported that, in India where small and marginal farmers are predominant were operating only at low level of output and productivity. This was due to rapid increase in input prices and relatively fluctuating prices of output.

Objectives of the study : The study intends to ventilate-

1. To characterize the family farms
2. To trace out space utilization pattern

METHODOLOGY

This study is an amalgamation of descriptive research, correlational study and exploratory research.This study is a blending of structured and unstructured approach.

Sample size: 270 samples were drawn by using Multistage Purposive Sampling.

Sampling Design: From the district, 3 blocks having >60% tribal population had been selected. Thereafter, 3 villages were selected from each block. After that, 30 farmers were selected from each village.

SELECTION OF THE STUDY AREA

1. **Selection of the district:** Jharkhand is comprised of 27 districts. Out of this one district namely East Singhbhum was conveniently selected for the present study.
2. **Selection of the block:** There are 11 blocks in Deoghar district. Out of these 11 blocks, three blocks namely Ghatshila, Patamda and Baharagora block were purposively selected for the study.
3. **Selection of village:**Darisai, Bodhpur and Bhamradih villages of Ghatshila block, Dongagarh, Dhatkidih and Loraidoongri villages of Patamda block, Jarabani, Pochakhuli and Satpati villages of Bharagora block were selected.

RESULTS AND DISCUSSION

Characterization of Family Farms

After a focused group discussion (FGD) conducted with the farm dwellers, five types of Family based Farming Systems were identified (Table No. 2). The classification was largely based on different components of the system. The classification is an output of thorough, on-the-spot personal interview vis-à-vis focused group discussion (FGD). Data collected through interview schedule was discussed with the key informants of the three blocks. At this stage, the credential of this classification was further consulted with the experts. The details of the types of Family Farms followed by the respondents were also investigated. Four types of Family Farms were identified in the study area.

It is noted from the table 2; that the Type I, which is comprised of crop, cattle, poultry, goatery vegetable and fruit crops, were 22.22% of all the farms. Type II farms (17.03%) comprised of crop, cattle, poultry, fishery, vegetable and fruit crops. Type III farms (18.52%) comprised of crop, cattle, and goattery which did not have conspicuous presence of horticulture components. But they have small homestead vegetable gardens. Type IV (22.22%) was devoid of poultry and goatery component while Type V (20%) had fishery component.

Diversity details (biodiversity and crop diversity) of different types of Family Farms:

Apart from such observations like; resource flow in a farm, the study intended to ventilate the diversity details of the farms. It can also be asserted that 'Space utilization pattern' of a farm deals with this aspect. In this way, the space utilization dynamics of the studied Family Farms can be synthesized.

Table 3 describes the diversity details of different types of Family Farms. Highest number of trees was recorded in Farm Type IV. However, number of trees/ acre was highest in Farm Type IV, Followed by Farm Type I. These two farms have vegetables and fruits as an integral part and hence the higher number of trees is expected. Farm type IV had forestry component with it.

Highest number of tree species was recorded in Farm Type IV followed by Farm Type I. Biodiversity measured by Simpson Index and Shanon Index was found highest in Farm Type IV followed by Farm Type II.

Energy consumption and energy input-output relationship in different farms:

Table 4.1.2.6 shows the details of input use and output gain from the family farms. The quantity of input and output multiplied by their energy equivalents generated the energy input-output scenario of the family farms. The major sources of energy input of these farms were nitrogenous fertilizers, followed by irrigation, power tiller and human labour. Energy input required per unit area was lowest for farm type V, followed by farm type IV and I. This was perhaps due to the presents of farm components that required lesser energy input like- nitrogenous fertilizer. Energy efficiency was also found to be highest for farm type V, followed by farm type I and II.

Mandal, Saha, Ghosh, Hati and Bandyopadhyay (2002) opined that energy input–output connections in trimming frameworks fluctuate with products being developed in arrangement, by sort of soils, nature of culturing operations for seedbed planning, nature and measure of natural compost, substance manure, plant insurance measures, reaping and sifting operations and, at last, yield levels.

Farming is both a maker and purchaser of vitality. It utilizes expansive amounts of locally accessible non-business vitality, for example, seed, excrement and enliven vitality, and in addition business energies, straightforwardly and in a roundabout way, as Diesel, power, manure, plant insurance, compound, water system water, hardware and so forth. Proficient utilization of these energies accomplishes expanded creation and efficiency and adds to the productivity and intensity of horticulture maintainability in provincial living (Singh, Mishra and Nahar, 2002).

Carbon stored (mt) in the woodlot in different family farms

Table 5 describes the carbon storing as a part of ecosystem is considered as an important strategy for reducing greenhouse gas emission to atmosphere. Tree biomass per unit area was found highest in farm type II, followed by farm type I and IV. The carbon storage of per unit area also followed the same pattern in farm type I, II and III. Horticulture, fruit trees and agroforestry are important components and hence, higher biomass and carbon storage also found in those farms.

CONCLUSION

The farm dwellers, particularly the small farmers of our nation, are defied with numerous financial, input oriented, institutional, regulatory and technical limitations obstructing the growth of farm income and in this way compelling them to live in distressful condition. The declining pattern in size of land holding represents a genuine test to the maintainability and benefit of farming. Along these lines, it is normal that no single endeavor can produce sufficient pay and work during the time to keep up a base way of life of ranchers, especially the small and marginal farmers of state.Data collected through household survey, FGD, PRA from three selected blocks of East Singhbhum namely, Ghatshila, Patamda and Bahragora revealed the followings: After focused group discussion (FGD) conducted with the farm dwellers, five types of Family based Farming Systems were identified. (Family farm type I= Crop + Cattle + Poultry + Goatery+ Vegetable + Fruits, Family farm type II= Crop + Cattle + Poultry + Fishery + Vegetable + Fruits, Family farm type III=Crop + Cattle + Goatery + Vegetable, Family farm type IV=Crop + Cattle + Vegetable + Fruits/ Forestry, Family farm type V=Crop + Cattle + Poultry + Fishery + Vegetable). Highest number of trees was recorded in Farm Type IV. However, number of trees/ acre was highest in Farm Type IV, Followed by Farm Type I. These two farms have vegetables and fruits as an integral part and hence the higher number of trees is expected. Farm type IV had forestry component with it. Highest number of tree species was recorded in Farm Type IV followed by Farm Type I. Biodiversity measured by Simpson Index and Shanon Index was found highest in Farm Type IV followed by Farm Type II. A blend of enterprises like fishery, poultry, forestry alongside yield development and so forth is important to beat the issues confronted by the asset poor agriculturists, i.e. farming system approach in dealing with the accessible assets is accepted to have the probability to haul out the farmers from the endless loop of neediness. The family based farming system reasonably is an arrangement of components or enterprises, which are interrelated and connect among themselves in getting assets and conveying yields to the common condition. At the focal point of collaboration are simply the farmers in practicing control and access on decision of the sort and aftereffects of such different institutions.

ABSTRACT

For centuries, tribes of the 'Chotanagpur Plateau' region have stayed in geographical isolation, have maintained their distinctive culture of farming, have sustained on family farms, and struggled to overcome poor socio-economic condition. The tribal groups of this region have stayed outside the realm of the developmental outputs because they reside in forests and hilly tracts. On the other hand, the plateau of Jharkhand is popular for its mineral resources. Industries often consider these people as the passive resources. They have been used as cheap labour forces. As a result their condition was in doldrums. On the other hand, tribal communities are maintaining their indigenous farming. Tribal farming is not merely an occupation but it is the way of life, which for centuries has been shaped their lives and livelihood. They are dependent on small farms, which were maintained by the family members. The study is the modest endeavour to highlight the temporal dimensions of the family farms. The data was collected through questionnaire and interview with the participants and the collected data was analysed to discuss and summarised it's outcomes. PRA (Participatory Rural Appraisal) and FGD (Focused Group Discussion) are used here as a predominant methods of data collection. The findings had been summarized after throwing light on all the major aspects of the study. The conclusion and the suggestions were made to make the rural development possible through family farming.

Keywords: Family Farming, Temporal Dimension, PRA, Jharkhand, Tribal Agriculture

INTRODUCTION

Temporal dimensions of family farms deal with the time related facets of family farms in farm realities. It consents the farmers to express their perceptions about various cumulative incidents and impacts on farms over a period of time. The temporal dimensions of farms inside the natural examination remained generally inside the breaking points of the progressing time frame. The assessment is more about the recognition of negligence in natural generation than discovering deficiencies in the expert abilities of the farmers.

Critical advance likewise was made in growing more proper strategies to break down the aftereffects of farming system research and make suggestions in view of them. Two methodologies that merit extraordinary say are: flexibility (in the past, altered dependability) investigation which has turned out to be an especially profitable measurable device for examining consequences of on-farm trials, especially those that include farm usage or both agriculturist administration and execution (Hildebrand and Russell, 1996).

At the mid to late 1980s, some huge methodological and institutional advancement were presented in the execution of the farming system approach with an entire highlighted aspects.

One has included advancement and usage of philosophies to work with agriculturists to evaluate bio-resource (supplement) patterns and streams at the ranch family unit level. The thought is to decide biomass slants after some time and to help recognize, with the agriculturist, powerless parts of the cultivating framework for which changed techniques are expected to advance biological maintainability. Huge numbers of these methods have their root in RRA/PRA (Lightfoot, Bottrall et al., 1991).

For centuries, tribes of the 'Chotanagpur Plateau' region have stayed in geographical isolation, have maintained their distinctive culture of farming, have sustained on family farms, and struggled to overcome poor socio-economic condition. The tribal groups of this region have stayed outside the realm of the developmental outputs because they reside in forests and hilly tracts. On the other hand, the plateau of Jharkhand is popular for its mineral resources. Industries often consider these people as the passive resources. They have been used as cheap labour forces. As a result their condition was in doldrums. On the other hand, tribal communities are maintaining their indigenous farming. Tribal farming is not merely an occupation but it is the way of life, which for centuries has been shaped their lives and livelihood. They are dependent on small farms, which were maintained by the family members.

METHODOLOGY

This study is an amalgamation of descriptive research, correlational study and exploratory research.This study is a blending of structured and unstructured approach.

Sample size: 270 samples were drawn by using Multistage Purposive Sampling.

Sampling Design: From the district, 3 blocks having >60% tribal population had been selected. Thereafter, 3 villages were selected from each block. After that, 30 farmers were selected from each village.

SELECTION OF THE STUDY AREA

1. **Selection of the district:** Jharkhand is comprised of 27 districts. Out of this one district namely East Singhbhum was conveniently selected for the present study.
2. **Selection of the block:** There are 11 blocks in Deoghar district. Out of these 11 blocks, three blocks namely Ghatshila, Patamda and Baharagora block were purposively selected for the study.
3. **Selection of village:** Darisai, Bodhpur and Bhamradih villages of Ghatshila block, Dongagarh, Dhatkidih and Loraidoongri villages of Patamda block, Jarabani, Pochakhuli and Satpati villages of Bharagora block were selected.

RESULTS AND DISCUSSION

Historical Transect of the family farms

Historical Transect is a PRA method which was used to reconnoitre the temporal aspects of the family farms. It revealed the changes in farm resources over a period of time. During PRA, discussion with the key- informants explored the causes behind the changes in farm over time. Figure 1 was an output of the cumulating result (of three blocks) of discussion. Thereafter, overall changes were represented through spider diagram.

Figure 1 covers various aspects of family based farms like- crop diversity, livestock, water resources and yield. The time line transect of the figure segregates the history in six fold of times- before 1950, 1950, 1970, 1990, 2000 and after 2000. A glance on the figure would create a clear idea about the major changes in family farms over time. It is clear from the figure – During 1950, crop diversity was reduced in farms. Discussion with the key-informants also revealed that because of scarcity of rain fall yield was also reduced during this period of time. This area faced severe drought condition during this period of time. After that, aspects like-crop diversity, livestock and yield were increased but water level was decreasing day by day. During 1990s, tube/ bore well and other water structures were installed in the study area.

The crop diversities were come down during 1950s. It happened because of mono-cropping of paddy. From 1970s, crop diversity was increased. To some extent some vegetables were grown along with paddy. The positive side, revealed from the discussion was that villagers were quite optimistic about the future of their family farms. The study revealed that condition of ground water was quite alarming. Gambling of monsoon and decline in ground water level might create hindrance in their farm sustainability.

The transcription of FGD was thoroughly analysed. Figure 2 was an output of the analysis. From this figure, historical events could be clearly understood. The aspects which had major impact on family based farms were discussed and expressed in the light of timeline. The outcomes of the discussion were compressed in Figure 2.

Seasonal analysis: Food Availability in Family Farms

Seasonal diagram is an output of seasonal analysis, done by the dwellers of the farm families. The special focus of this analysis was to ventilate the relationship between food availability and season. From the diagram it was found that during three month's lean (March-June) period, farm dwellers used to face food scarcity.

Food security has remained one of the most important concerns of the study area because of its scattered rainfall. Figure 3 gives an overall idea about the extent of food security across the season. Table 1 provides an idea of food consumption by the household under different types of family farms. Rice is the most important source of carbohydrates. For most of the households in all types farming system, food was available throughout the year. Farm type I, II and V were most assured of food items on their own farms than the other farm types.

CONCLUSION

The farm dwellers, particularly the small farmers of our nation, are defied with numerous financial, input oriented, institutional, regulatory and technical limitations obstructing the growth of farm income and in this way compelling them to live in distressful condition. The declining pattern in size of land holding represents a genuine test to the maintainability and benefit of farming. Along these lines, it is normal that no single endeavour can produce sufficient pay and work during the time to keep up a base way of life of ranchers, especially the small and marginal farmers of state. Everyone now agrees to the fact that increasing population and land fragmentation is going to affect human managed systems as well. Farming systems, in particular, is vulnerable to such changes. Since living has become more complex than before, human need, specifically food habits, has also been shifting rapidly and among the people consensus is on the move that alone farming cannot meet these growing demands of the people by crop cultivation only. It needs diversification with other enterprises in the farming systems to cope up with this change. Chotanagpur Plateau region, study area, is feared to be worst affected by such changes as along with anthropogenic

changes societal variations are very prominent in the area and hence need alternative livelihood strategies to reduce the odd impacts on the farming systems of this region.

ABSTRACT

The paper entitled "Urbanization: Changes in the Socio-Economic condition of the tribes (Bhumij)" is a modest endeavor to highlight the Impact of urbanization on the tribes (Bhumij) of Lowakui, Purulia. Scheduled Tribes (STs) are indigenous, have their own distinctive culture, geographically isolated and are low in socio-economic conditions. For centuries, the tribal groups have remained outside the realm of the general development process due to their habitation in forests and hilly tracts.Ever-since India embarked on the path of developmental planning there started a series of infrastructure projects, be it Basic and Heavy industries. Industrialization and urbanization stimulate migration. Apart from migrating 'Bhumijs' from their ancestral 'Tanda' (Colony) and 'severing their cultural ties and bonds established over generations', migration also devastates the social life of them. 'Quantitative as well as Qualitative approach has been adopted for the study. 'Participatory Rural Appraisal' and 'Case Study' are the integral part of the research work. The study also thoroughly analyses the constraints face by the migrated Bhumijs. Case study method plays a vital role to realize their situation. Some case studies reflect the physical and sexual exploitation of the migrated tribal women. The study provides a snapshot of the critical issues affecting the traditional tribal culture and society. Finally, the study has tried to provide concrete and useful suggestions for the tribal development.

Keywords: Urbanization,Industrialization, Socio economic lives, Physical and sexual exploitation, Migration, Quanti-Quali approach, 'Participatory Rural Appraisal' and 'Case Study'

INTRODUCTION

Jojo (2003) opined that after independence, capital intensive establishments were considered as *modern temples* of India. Baxi (2008) has been shown that no development without displacement became the *mantra* of developers everywhere. The tribal communities generally dependent on Forest- Hunting, Hill Cultivation, Plain Agriculture, Simple artisan and Folk Art etc. Due to urbanization, many of the tribal are migrating to different industrial belts and towns. Nature and natural resources are now treated as the 'Passive Resources'. It is because of industrialization, urbanization and its natural consequences. Expansion of urban areas and deforestation is going on parallely. These types of incidence have changed the definition of the tribal life. Tribal society is largely egalitarian and tribal women have been equal partners withtribal families and have the contribution to household economy. Quite often their women do more physical labour in their agricultural fields and forest than that of the tribal men. Society for Regional Research and Analysis (2010) opines that it has been observed that large number of educated, uneducated and illiterate tribal women from Jharkhand, Chhattisgarh, Orissa and West Bengal migrate to different parts of country and metropolitan city like Delhi, Mumbai, Kolkata are their major destinations for searching some gainful employment/casual labour in the unorganized sector and as household maids for their livelihood. They are often exploited physically and sexually. These types of incidence have changed the definition of the tribal life. Oomen (2004) opined that thus, the rural was to be displaced by the urban; agriculture by industry; low, simple, or traditional technology by high, complex, or modern technology. But the obsession with a particular pattern of development and the displacement it entails whereby the green fields (belonging to people) are being turned into Greenfield (or such corporate hubs with ironically misleading names) – is playing havoc with the lives of large number of people and, hence the need to turn the spotlight on it.

The plateau of Chotanagpur is not only popular because of abundance of mineral resources but also popular as it is the dwelling place of various tribes. Mainly 'Protoaustraloid' tribes are sprung from the earth of Chotanagpur plateau. They have their own lifestyle and culture. Their lives and livelihoods were mostly dependent upon nature and natural resources. There was a reciprocal relationship between nature and the tribes.

Brief note about the Bhumijs

Bhumijdepicts one who is born from the soil. They form one of the Hinduised Adivasi groups inChotanagpurplateau. They are Austric-speaking people who have adopted Bengali as their second language due to their contact with the Bengali-speaking people of Purulia district of West Bengal. Generally, Bhumij family is patrilineal type. Monogamy marriage is their tradition. But Bigamy/ Plygamyis not prohibited. Levirate and Sororal marriages are not also restricted. However premarital relations within the lineage group are prohibited. Marriage may take place between boys and girls of two different lineage groups but it is avoided.

Forest product and agriculture produce are main source of livelihood of them. They have a strong believe in animism and they also practice ancestral worship. They believe in naturalism and worship objects like animal, birds, sun, river, mountain, tree, plants and bushes. The Bhumij landholders rose to the status of feudal chiefs and then to the status of kings claimed themselves as Kshatriyas of Solar or Lunar dynasties.

Objectives of the study

Keeping the aforesaid objectives in view and looking at impact of urbanization on the socio economic lives of the Bhumijfrom Lowakui, a study was conducted to find out:

1. To understand the impact of urbanization on the socio-economic lives of the Bhumijs
2. To find out the sufferings of the migratedBhumij women.
3. To perceive the perception of the Bhumijs about the impact of urbanization.

The empirical study was conducted with a broader objective *to bring desired positive changes among the tribes.*

Research design

The present study is a comparative and descriptive one. The study is also based on Ex- post facto research design. Based on the research problems, specific objectives were decided. Basically based on review of literature, the problem and related issues were understood. After that, the process of data collection was started.

Locale of the study area: The present study was conducted at the picturesque hamlet of Lowakui (Block: Baghmundi, Dist: Purulia, State: West Bengal). It is about 40 kms from Purulia town via Balarampur. It is 10 kms away from Baghmundi. The village is nearer to famous 'Ayodhya' hill. It is 2133 ft above sea level. It is located close to Charida village also. The village situates under the jurisdiction of 'Matha Forest Range.

S**ample size :(n)** of the study was **75 from 25 families.** In order to select the sample**, purposive sampling was done.**

Study period: The study period was from 11th September, 2012 to 11th August,2013.

The methods of data collection were both quantitative and qualitative in nature and were aimed to seek answers to certain research questions which would be deducted from various studies, researches and also during the field study. Given below is a list of the major techniques of data collection utilized by the

Researcher-author for the present study

1. Interview
2. Observation (Participant Observation and Non-Participant Observation)
3. Case Study
4. Focused Group Discussion (FGD)
5. Participatory Rural Appraisal (PRA)

The findings of this study had been discussed after analysis of the collected data and were subsequently summarized. The conclusion and the suggestions were aiming to bring desired positive changes among the tribal community.

Key findings: Impact of urbanization on the socio economic lives of the Bhumijs

Findings: In the light of Objective 1: To understand the impact of urbanization on the socio-economic lives of the Bhumijs.

The economic life of the tribes is specific in nature. Their social life also varies from one to another. The independent variables which were taken for measuring the findings of the research were age, family size, family education index, family occupation, individual income. Rather than these Socioeconomic Status Scale of Kupuswamy, (1976) is used to measure the socio economic condition of the study area.

Figure 1 reveals that large land owners have a trend not to work at Mines of Asansole. They generally migrated to Asansole ,Bokaro and Tatanagar. Those who have large land holdings; they are generally involved in Agriculture. Landless respondents have a trend to work as Mine labours and labours.

As they have large land holdings, they are generally involved in Agriculture. Landless respondents have a trend to work as Mine labours and labours. This reveals that those have small land holdings; they are prone to work in the mines.

Decline in Joint Family: Bhumijsettlements are known as Tandas. Their society is largely egalitarian. The female candidates migrated with their husbands. They used to live at the urban slams of Assansol, Bokaro and Tatanagar for that particular season, nearer to the Industrial belt. The result of PRA was also showing the same trend of breaking down of joint family to nuclear families.

Acculturation and detribalization: Tribal cultures have evolved over millennia in their particular habitats and environment. Most of them have evolved in isolation as the interaction between tribals and non-tribals have been minimal. These customs and beliefs are different from the mainstream cultures.

Most of the migrated respondents are working in the industries as casual labours. They are devoid of any type of care and protection. They are influenced by the urban culture. Finally it affects the root of the tribal culture. Along with these, industrialization has changed their socio-economic condition. As a result of industrialization and migration, the tribal communities are adopting the modern culture and life style. Their source of income is changing. They become more vulnerable and dependent on industry. Trend analysis shows that Women become more vulnerable. They are treated as easily available commodities. Women are now trying to be a part of the 'Babu' culture. They are adopting Hindu rituals and customs. Those who are residing nearer to the industry, they often influenced by the urban/industrial culture. Electronic media (like; TV) also plays a vital role in 'Detribalization' process

Table 2 shows that there is a statistically significant relationship between then involvement in traditional programme and distance from the urban area. The Bhumij communities generally dependent on Forest- Hunting, rope making etc. However, due to industrialization/ urbanization, many of them are migrating to industrial belt of Assansol, Bokaro, Tatanagar. Some of them are living in the close proximity of the industries. They are working in the industries as casual labours. They are devoid of any type of care and protection. They are influenced by the urban culture. Finally it affects the root of the tribalculture. Along with these, urbanization has changed their socio-economiccondition. As a result of urbanization and industrialization, the tribal communities are adopting themodern culture and life style. Their source of income is changing. They become more vulnerable and dependent on industry. Women become more vulnerable. They are treated as easily available commodities. Hence, the Bhumijs, who migrated from Lowakui, avoid their cultural norms. It is because of acculturation and Sanskritization. But the Bhumijs of Lowakui lived in a isolated forest fringe area. Hence, the impact of industrialization and urbanization is less on their socio-cultural lives and it helps them to sustain 'Bhumij-hood'.

Improvement of economic condition

t-Test: Paired Two Sample for Means

From the output of the above table, it is observed that the p-value for two-tail test

(1.1714E-06) is less than the specified level of significance (0.05). So we **fail to accept**

Null Hypothesis (H0) and accept the Alternative Hypothesis (H1)

Hence, from the above decision, we can conclude that the difference between income (in Rs.) before and after getting migrated at Towns/ urban areas is statistically significant. Hence, we can interpret that after industrialization there has been a significant increase in the average income of a migrantBhumijs.

From the output of the table, it is observed that the p-value for two-tail test (0.072245914) is greater than the specified level of significance (0.05). So we accept Null Hypothesis (H0).

Hence, from the above decision, it can be concluded that the difference of income (in Rs.) before and after 10 years (people living at Lowakui) is not statistically significant. Hence, it can be interpreted that after urbanization there has not been a significant increase in the average income of Bhumijs of Lowakui.

When all of them used to live atLowakui, they had their primitive economy. They were though broadly branded as hunter-gatherers. The Bhumijs collect jungle products and exchange them with the neighbouring settled Hindu peasants for their day-to-day livelihood. Massive investment in urbanization and industrialization create wealth to the nation and employment opportunities to various people. It also happened at Assansol, Bokaro, Tatanagar and other industrial belts, nearer to Purulia. Those who migrated to the urban areas, their economy has been changed. They are often willing to take on jobs that others cannot or do not want to do (those that are dangerous; like mine

labours, brick industry labours, construction labours etc.). Although the work is insecure and nominal paid but it is very essential for them who are from marginal areas where wages are too low to make a living. Income is one driver, with people migrating in search of paid employment. Because of this paid employment, they are getting regular income. But the Bhumijs of the Lowakui is dependent upon their traditional economy. Along with this their traditional economy is also hampered because of implementation of new forest laws.

Findings: In the light of Objective 2: To find out the sufferings of the migrated Bhumijwomen

Exploitation of the women:

'A new feature of tribal migration from Lowakuiin recent yearshas been the large - scale migration of single women to cities in search of livelihood, which is a subtle change from the earlier migration patterns when only the men migrated to urban centres/ industries. Bhumijfamilies nowadays are driven by poverty to send unmarried daughters/ married wife to cities in search of work. Single women and tribal girls are however, prone to exploitation not only by employers but also by anti-social elements.' Tribal migrant women exploitation is mostly done by the middlemen who offer them good emoluments, good placement and work conditions and after they are taken to the work place they are cheated.

The specific case of PhoolmaniSing Mura could enlighten the issue. Present author talked with her. The summery of the conservation could be included.

Specific case

Name: PhulmoniSing Mura / Name of the husband: BudhiaSing Mura / Children: Four Sons / Age: 55 years

Phulmoni of Phuldungri is illiterate. Her parents did not send her to school. It is not a matter of regret to her. She says that today's girls of Lowakuiare also going to school. As a result their household activity is being reduced. Electricity facility is available now. Hence, girls watch TV throughout the day. They are influenced by the TV heroines.

Their social lives have been changed. This is because of urbanization. She believes that people has lost their 'Bhumij-hood'. There is no real Bhumij atPurulia city!!!

Phulmoni opined that electricity facility was not available in that time atLowakui. Hence TV was not also available. She added, 'they were the real Birhors'! The word 'they' denotes the earlier inhabitants ofLowakui. Those who live in city, consider themselves as the 'Hindu'. Phulmoni knows that caste cannot be changed. Caste membership cannot be achieved as it is the ascribed status. They are not the Hindu also. It is an imitation.

The girls were not sent to cities as because they were often being exploited. But now a day they are going to work in the cities. Their parents send them to work in brick-factories.

The daughter of Phulmoni also went to Tatanagar. She was a construction labour. The agent of the labours was a lascivious person. The women labours were often exploited because of his debauchery. Phulmoni's daughter was not an exception. Her husband knew everything. But he was an avaricious person.

Avarice leads to vice, and vice leads to death. At last she committed suicide. Local newspaper covered the news. Phulmani's eyes bathed in tears……

Economic exploitation: They often exploited by the labour agents. They are economically exploited. The payment is also irregular. They were economically deprived against their toils. The recruitment of migrant construction workers from this area was largely done by agents/contractors. They provide the labourers a cash advance to help the family left behind in the absence of the migrant. The advance is also used by the migrant to purchase essentials for the journey. The advances are repaid through migrant wages and the length of time that this takes depends on the payment that the migrant receives at the destination. The contractors recruit migrants in groups who stay together at the destination. Living conditions at construction sites and working place of the migrant s are appalling

and contractors provide only the most basic shelter. Harassment by the police, urban authorities and contractors is common to the Migrant Bhumijwomen.

Findings: In the light of Objective 3: To perceive the perception of the Bhumijs about the impact of urbanization. (Use of PRA tools)

Health hygiene and immunization: Those who left Lowakui10 (ten) years ago, they did not have any idea about health and hygiene. They were illiterate. Hence, they were not concern about the issue. On the other hand, the dwellers of the village were habituated in open air defecation. Government built some sanitary latrine. But it seemed to cast pearls before swine. Actually they were not sensitized. They did not feel the necessity of sanitary latrine. Education has knocked on the door of the casual labours of the cities. It is because of urbanization. As they live at the industrial belt, they have enough opportunity to be sensitized regarding the issue. The NGOs often organize motivation camp on the necessity of sanitary habits (in city slums).

Declining food insecurity: 78% respondents of the migrant and only 8% respondents of non migrant are food secure. 16% respondents of migrant and 40% of non migrant are food insecure without hunger'. 6% respondents of migrant and 40% of non migrant are Food insecure with moderate hunger'. But there is no respondent who is food insecure with severe hunger 'atmigrant. 12% respondents of non migrant are food insecure with severe hunger'. (United States Department of Agriculture's food security scale, 2000 is used).Migrant is nearer toPurulia, Assansol, Bokaro and Tatanagar. Most of them have paid income source. Hence, they have access to secure foods. But the dwellers of the non migrant survived as best they could on a bit of rice each day plus somechakora, a spinach-like vegetable, and the roots of a plant known as *gethi*.(The problem is that *gethi*is poisonous. It needs to be soaked in water for 24 to 48 hours to leach out the toxins and become safe to eat).They also survive on food gathering and hunting. But they have not any safe subsistence economy. So to say these inverse conditions stimulate their food insecurity.

Educational aspiration for the children: 2% parents (among the migrants)have desired to provide secondary education to their children. 8% mothers would like to provide higher secondary education to their children.30% mothers would like to see their children as graduate. 36% mothers have aspiration to send their children in university. 24% mothers would try to provide technical education to their children. They claimed that they were exploited in the city as they were not educated. Some of them were unable to calculate also. They did not want that their children would exploit like them. Social security here played a vital role. Hence, they decided to make their children educate so that they could enjoy a better future.

CONCLUSION

The findings prove that the urbanization has dual impact on the lives ofBhumijs.Those who live nearer to the industry/ urban belts they have the problem of detribalization. On theother hand, the non migrantdwellers ofLowakuihave separate problems. They are economicallybackward. **12% of them are „Food insecure with severe** hunger.Migration becomes a common issue in post urbanization period. While thetribes are migrating in the industrial belt i.e.Assansol, Bokaro, Tatanagar, in that time their family facedtremendous blow of poverty. Finally it can be concluded that those who are living nearerto the city, became economically sound than those of who reside away from the city. But detribalization grasped their culture. They lost their self identities. Hence, itcould be concluded that the development should be for the tribes, of the tribes and bythe tribes.Swain (2009) commented on this issue: These people are asking verypertinent questions; why should they be obliged to endure disproportionate costs ofdevelopment and why in the process of development should they be treated as lessercitizens? These questions are all the more relevant when viewed from theConstitutional vantage point. The preamble of the Constitution of India, speaks ofjustice, social, economic and political, and the Constitutional spirit, is arguablyespoused by Article 14 which guarantees *equality before law* and *equal protection oflaws*.

ABSTRACT

Present paper describes various facts and facets of digital financial inclusion. In order to increase customers and also to approach more people in digital financial services and DFI has been developed for making it more economically stable for the customers belonging to different economical background. Along with several benefit that has been possible after digital financial services came into existence, there are some challenges arose too. In 12th Mint Annual Banking Conclave the Deputy Governor of Reserve Bank of India, N.S. Viswanathan said that, "Digital Platform of financial services improved the financial inclusion; it has not only benefits the customers but also improved the credit assessment for the lenders. Present paper could be considered as a tool to analyse DFI. The paper is concluded with a remark: It can also be said that, Digital Platforms are majorly facilitates urban people rather than rural people. Although urban people are also facing several challenges to be a part of digital financial services, like generation gap is a major issue for understanding digitisation of financial services.

Keywords: DFI, Digital Platform, e-commerce, financial inclusion, RBI

INTRODUCTION

Digital Financial Inclusion is an initiative to reaching out more customers and people who are already using bank and such formal financial services, and make formal finances more accessible and affordable to them. The innovation of digital financial services make millions of people moved to cash based transaction to formal financial services. In order to increase customers and approach more people digital financial services has been developed for making it more economically stable for the customers belonging to different economical background. Along with several

benefit that has been possible after digital financial services came into existence, there are some challenges arose too. In 12th Mint Annual Banking Conclave the Deputy Governor of Reserve Bank of India, N.S. Viswanathan said that, "Digital Platform of financial services improved the financial inclusion; it has not only benefits the customers but also improved the credit assessment for the lenders. Among the lenders the segment of digital financial services benefits self-employed, small and micro enterprises and small borrowers as well who are considered to be inefficient for the formal financial services."

Digital Financial Inclusion can be defined as increasing and improving financial accessibility and increasing usage of formal financial services for the *financially excluded and the undeserved people,* in terms of making it possible the digital platform had been developed to be user's friendly and improved financial accessibility and economic stability which suits both the consumer and provider. In simpler words, Digital Financial Inclusion can be defined as a digital platform where people can make payments, do transactions. It also facilitate the *financially excluded and financially undeserved people* by saving, lending, insurance and providing economic security as well.

Inside into the DFI: In the 12th Mint Annual Banking Conclave the Deputy Governor of Reserve Bank of India, N.S. Viswanathan also said that, "it has been predicted to reach about 284 billion USD in 2016 from 11 billion USD in 2013." He added to his point that, "a analysis has been directed by the Boston Consulting Group who had assessed the growth of digital financial services and observed an exponential progress in next few years.

A study has conducted on UPI money transactions, which shows that, there is a jump of transaction of almost 18% against February, 2019, whereas there is a jump of 25% amount transferred through digital platform which is the highest jump in last few months.

According to National Payment Corporation of India, they revealed a data of Immediate Payment System (IMPS) that, in March 2019, 190 million transactions has been completed in whereas 166 million transaction has been done through Immediate Payment System (IMPS) which is 14% jump of number of transactions in one month. They have also been added that, the total transaction amount is nearly 1.7 lakh crore, comparing to this; the total transaction amount is almost 1.5 lakh crore.

National Payment Corporation of India has also revealed that, there are also many digital platforms where online transactions has been done, such as National Electronic Toll Collection, which is a digital transaction platform where the payment is being done without stopping at any toll. In National Electronic Toll Collection there is a shift of online transaction of nearly 2.2 million in March as compare to February, 2019.

Data trends: A discussion: The above data and trends are showing the enormous use of digital transaction over the period of time. The number of transaction and amount of transaction is increasing day by day, so it can be assumed that people are getting more involved in digitisation of transactions and people are becoming more aware about digital transactions. The facilities the customers are getting and the benefits digital finances are providing is the consequence of rapid growth of digital financial services. In Mint Annual Banking Conclave DilipAsbe, Managing Director and Chief Executive Officer of the National Payments Corporation of India (NPCI) talking about future of Digital Financial Services in India that, "in a country like India where cash-based transaction is popular than other transactions, in that time digitisation of financial services are in a critical period which will remain few more years, people need to be digitally educated, which requires few time."

The trends and the upliftment of Digital Financial Services are clearly showing that there are numerous advantages for using digital financial services. There are several thing which are being upgraded by Center for Digital Financial Inclusion in digital Financial Services. Some of the notable advantages which help customers and motivate to use Digital Financial Services are as follows,

Digital empowerment of citizen is one of the main center of attraction among the several other advantages. Along with the traditional financial knowledge, there need to be awareness of digital platforms of financial services. So the rapid digitisation of financial services is providing empowerment to the people.

There is no such long queue in digital transaction, and one tap transaction, money transfer is possible now. Which saves time of the people rather than waiting in a long queue in bank and other financial institutions? Other than that, people needs travelling cost in traditional financial services whereas digitisation of financial services saves money for that. Along with that digital transactions have easier transaction process and payment methods.

Digitisation of financial services does not need enough documents which is very helpful to the rural poor having less formal document, for which a major proportion of rural poor is being excluded from formal financial services, but digital financial services they are not excluded from banking and financial services.

Digital Financial services are available 24X7 which helps people in any time transaction at any place around the globe. Some digital platforms like NEFT (National Electronic Fund Transfer) and RTGS (Real Time Gross Settlement) are so popular now day, due to low cost transactions and money transfers and it is also one of the fastest modes of money transfer.

Traditional method of financial services requires much paperwork which is not eco-friendly, in case of digital banking there is no such paperwork required so the digitisation of financial services is environment friendly.

Disadvantages

Like numerous benefits and advantages, there are also some disadvantages too which does not let the Digitisation of financial services meet the main objective to meet the *financially excluded and undeserved people.* Although it has a great achievement in online transactions, Digital Financial Services failed to reach the poorest of the poor.

The main disadvantage that begins with digitisation of financial services is literacy and digital literacy among the users of digital platforms. In case of interior parts of rural India, there are numerous uneducated people who don't even able to read alphabets, rather than that, digital financial services required the knowledge of using devices used in digital finances. So, it is quite getting failed to achieve reaching the people of interior parts of rural India.

Awareness of Digital financial services is one of the essential things to use digital finances; there are plentiful people who are still unaware about digital finance which makes them excluded from digital finances.

As mentioned above interior parts of rural India is still lacking in electricity and network availability, so there is no chance to build up a system of digital financial services.

There are people in India who can hardly afford two times food for their family, for them affordability of digital devices is quite impossible; hence financial using digital financial services by them is always will be question.

There is a requirement of hard cash in everyday life especially for the traders, so all time digital finance using is impossible for everyone.

In 21st digital security is a big question mark. There is no security for online transaction and online payments though the digital finance providers are trusted. There are several cybercrimes are happening all around the globe. So there always will be a security issue for the digital financial services.

CONCLUSION

In case of if rural India is ready or not for Digital Financial Services, there are several advantages and demerits for using digital platforms. Electricity and network coverage will always be an issue for mobile banking but many network providers are trying to increase their coverage area which may help the rural part of the country. *Textual and technical literacy* will always be a problem but awareness campaigns are a probable solution to overcome this. But Digital Financial Services are also helpful where using alternative financial services and accessing formal financial services is a great challenge.

In a concluding part, it can be said that, digital financial services are more successful among urban poor rather than the rural poor and the poorest of the poor in India. It can also be said that, Digital Platforms are majorly facilitates

urban people rather than rural people. Although urban people are also facing several challenges to be a part of digital financial services, like generation gap is a major issue for understanding digitisation of financial services.

ABSTRACT

The minimum support price which is fixed by the CACP, actually considers the factors regarding the production function. It includes the cost of production at different levels which consists of costs of inputs such as seed, fertilizer, manual labour as well as machineries and also entails the implied cost of family labour and in the final stage includes the implied rent on land and interest on capital assets. The procurement price is the price which is usually higher than the minimum support price but not have any connection with open market price. The MSP is the very important for the product which are covered under it. But it has also some demerits. The small and marginal farmer can't get the full benefit from the MSP. The big farmer only gets the benefits. MSP and Procurement price both are fixed by Government and maintain by Government only. The open market doesn't have any relation with it. Government has its some procedure to collect the procedure and the payment also not done immediately. The small and marginal farmer who needs the immediate cash can't wait for government procedure. Present article focuses on various facts and facets of MSP.

Keywords: MSP, CACP, Cabinet Committee of Economic Affairs, National Agriculture Cooperative Marketing Federation of India Ltd.

INTRODUCTION

Minimum Support Price (MSP) is a form of market arbitration by the Government of India for Agriculture Produce. The minimum support prices are declared by the Government at the beginning of the every sowing season of Particular crop for specific yields based on the suggestions of the Commission for Agricultural Costs and Prices

(CACP). MSP is the price which is an assumption done at the beginning of Crop Season. MSP is the backbone of our countries Agriculture. Farmers get their faith to have some profit by cultivating the crop. MSP helps them to quantify the area of cultivating and the amount they should put for Farming this year. MSP price is determined by Government and maintain by Government only. The market price may be differing from the Minimum Support Price. MSP is not applied for all the crops. It is only applied for 25 crops from largely cereals, pulses and oil crops. The crops which are perishable don't come under Minimum Support Price. The crops which can store easily and have a huge use are come under MSP.

The MSP is fixed with the idea is that the crops price can't go down to this level in any condition like huge Production. Government also issued Procurement price for the crop which comes under MSP. The Procurement price is determined after the harvesting of the Crop. Procurement is declared with the idea to give the Farmer more and more benefit from their produce. Different public agencies like Food Corporation of India procured the food grains of Kharif and Rabi season at the procurement price for the distribution through Public Distribution System. The procurement price is the price which is usually higher than the minimum support price but not have any connection with open market price.

Historical Perspective

The minimum support price fixed by the CACP by considering the factors regarding the production function. It includes the cost of production at different levels which consists of costs of inputs such as seed, fertilizer, manual labour as well as machineries and also entails the implied cost of family labour and in the final stage includes the implied rent on land and interest on capital assets.

In 1965, first MSP was declared by Government of India. From then till now it plays a significant role. The Cabinet Committee of Economic Affairs (CCEA), Government of India, fix the Minimum Support Price. It is fixed as a National Level with the help of Commission for Agricultural Cost and Prices. But to fix the National level MSP it has to play a very significant role of every State Government to find out the input cost of every crop. To find out the Input cost the state has some tier wise structure as village household level to district level. Sometimes any Non-Governmental Agencies may also involve in this process.

Inside into MSP

In this country due to diversified agro-climatic condition the crop varies from state to state. Generally the crops sown in Kharif and Rabi season come under minimum support price policy. The Government of India and CACP selected 25 general crops including Paddy, Jowar, Ragi, Bajra, Maize, Arhar, Moong etc as Kharif Crop; Wheat, Barley, Gram, Masur etc as Rabi Crop; Cocunut, Jute, Sugarcane etc.

Specific case

The state like West Bengal we can only found Jute and Rice are the Major crop which is covered under MSP. Despite of huge no of crop which has a very good production in West Bengal but only this two crops are procured. The State Government's Food and Supplies Department is responsible for the Procurement process of crops. In every district there are Directors to manage the whole process. The procured food grains are used for Buffer Stock and Supply through the Public Distribution System. For Rice we can found a state level structure but for Jute we can't find a state level structure in West Bengal according to Niti Ayog Report (2016). For Rice in West Bengal the MSP is operates through three agencies i.e. National Agriculture Cooperative Marketing Federation of India Ltd. (NAFED), National Cooperative consumers Federation of India Ltd. (NCCF), West Bengal Essential Commodities Supply Corporation Ltd. (WBECSC).

The MSP is the very important for the product which are covered under it. But it has also some demerits. The small and marginal farmer can't get the full benefit from the MSP. The big farmers only get the benefits. MSP and Procurement price both are fixed by Government and maintain by Government only. The open market doesn't have

any relation with it. Government has its some procedure to collect the procedure and the payment also not done immediately. The small and marginal farmers who need the immediate cash can't wait for government procedure. Some issues related to MSP are like, Farmer focused on those crop which has high MSP and Covered under MSP; all farmer want to sell their product to Government, it may leads to shortage of product in open market; the MSP is fixed by an assumption and seeing the previous year's trend, the survey for MSP sometimes goes wrong which may lead to an bad assumption of MSP; the produce which is not cover under MSP but has some good value at regional basis sometime face huge loss; the access of MSP is not equal, sometime MSP stays below open market rate, then it becomes problem to Government to gather product; the payment procedure of MSP to the farmer is very lengthy etc. These are some issues and challenges related to MSP have to face by the people.

The increasing in MSP of agricultural production hastens the process of accumulation. However, the small and marginal farmers are generation small amount of surplus and that surplus they are selling in the local market. The small and marginal farmers are producing less amount of surplus product and this surplus product need to be market with MSP. The rural rich who are also produce surplus producer and they have good transport facility and they will get benefit from the MSP but most of the small and marginal farmers are not able to sell there product in the government market. They totally depend on the local market and which is not covered by MSP. The farmer will get MSP price for their product only in the government market. The sometimes the farmers are selling their product in the local market through the local agencies with the prices and that price more than minimum support price. Most of the small and marginal farmer in rural areas they sell their surplus product due to the needfor immediate cash. Therefore, the increasing MSP of the agricultural commodities will leads to increase of final products of the industry as they used formal row material. As a result, the poor small and marginal farmer will get more affect due to increasing expenditure on food and another living cost. Therefore, increasing MSP will not help small and marginal farmers.

CONCLUSION

In our society has lots of diversity and inequality in terms of cast, gender, class, and religion. Therefore, it is necessary to look at another factor with increasing MSP for small and marginal farmers. It will be a better option if the government of India looks at other factors that are most important for the small and marginal farmers in India. If the government provide subsidies inputs such as fertilizer, new technology, and other input then they will increase profitability from the crop production. There is no good road, and transport facility in rural areas. The largely small and marginal farmers do not have good irrigation facility and other infrastructure that is most important for the farmers. Therefore, the government should more investment in this infrastructure. These are the fact that more important than MSP. The government agency should have reached the village level and increasing market linkage in the rural areas so that farmers can sell their product direct to the government. One of the most important things is that most of the rural farmers are not aware of the MSP for their product and they are totally depending on an intermediarytoselling their product. Therefore, the government should element this intermediary and government agency should reach the village level and purchase their product. The information should be provide at the village level. The government market should link with the village market then the small and marginal farmer will get benefit from the MSP.

The current government of West Bengal is doing a campaign at the village level for the purchase of agricultural commodities direct from the farmers. Due to this intervention, the farmers can sell their product direct to the government at the procurement price. The farmers are not depending on an intermediaryto sell their product. This intervention happened at the three levels such as Block, Panchayat, and village level. The farmers get money by checks from the government office like farm or Panchayat office. This intervention reduces farmers transport cost and the role of intermediary. The choice of crop for MSP should be based on regional each season. Therefore, the region farmers will get MSP on their regional crop. These interventions start this year and they collect rice at the procurement price. The whole campaigns managed by the local agricultural produce market committee.

ABSTRACT

For centuries, tribes of the 'Chotanagpur Plateau' region have stayed in geographical isolation, have maintained their distinctive culture of farming, have sustained on family farms, and struggled to overcome poor socio-economic condition. The tribal groups of this region have stayed outside the realm of the developmental outputs because they reside in forests and hilly tracts. On the other hand, the plateau of Jharkhand is popular for its mineral resources. Industries often consider these people as the passive resources. They have been used as cheap labour forces. As a result, several NGOs with their novel approaches, use to help people. Present study is an output of ex-post facto research design. Network Analysis is an integral part of it. The study concentrated on a specific case which revealed the family cases of East Singhbhum, Jharkhand. Finally, it concluded with a remark: Farm size had positive significant correlation with food security because bigger the farm size more would be the resources of the family with more viability which will naturally lead to increase in food security. Contact with NGOs too had positive significant correlation with food security which indicated that the relation with NGOs would help them to raise their capacity through training, information and sensitization. It may be because the village dwellers, associated with NGOs had good access to information or may be because they were aware of the new technical and farm related information which was given by these sources.

Keywords: Family Farming, NGO, Network, Case Study, East Singhbhum

INTRODUCTION

Chitambar (2015) defined 'Social Organization' as the classes of human relationship structures wherein individuals intentionally related in methodically orchestrated units to advance and accomplish some normal purposes or interests that are not particularly communicated in the establishment. In association every part has a formal status and part. It might be characterized as a gathering with unique concern and interests that have built up a structure including particular parts for different individuals, and that have a pretty much formal arrangement of guidelines and directions for operation. An association varies from an establishment by its attention on a barely restricted reason. It is gathering of individuals sorted out to seek after particular goals. Association may work inside organization. But the concept of 'institution' is quite different. Horton (1964) opined that institution is an organized arrangement of social connections which epitomizes certain regular qualities and strategies and meets certain fundamental needs of society.For centuries, tribes of the 'Chotanagpur Plateau' region have stayed in geographical isolation, have maintained their distinctive culture of farming, have sustained on family farms, and struggled to overcome poor socio-economic condition. The tribal groups of this region have stayed outside the realm of the developmental outputs because they reside in forests and hilly tracts. On the other hand, the plateau of Jharkhand is popular for its mineral resources. Industries often consider these people as the passive resources. They have been used as cheap labour forces. As a result, several NGOs with their novel approaches, use to help people. Present study concentrates on a specific case of a family farmer.

Objective

To trace out the networking of a family farmer

MATERIALS AND METHODS

The study was conducted taking samples from the East Singhbhum district of Jharkhand State. Multistage sampling technique was adopted for the selection of study area and sample respondents for collection of information required for the study.

Findings: A case study

'Since 12 years I have been thinning out innovative 'low cost technologies strategy' subsequent to creating links with various Government as well as Non-Government Organization (not only the organizations, working at my native place, but also with the organizations of other states). I attended several training programmes…..There was no government support for spread of new farming techniques aside from a couple of NGOs had some supporting initiative.

Simanta Mishra

Simanta Mishra, of Dhatkididh village, Patamda He was a progressive farmer. Age is about 35 years, B.Sc. passed. Their family was migrated from Odisha and started agriculture in that area in about 1940. They were the land lords or *Zamindar*of that area. He was very much fond of diversified production. He ranked first in respect of resource integration in his farm. Wellbeing ranking revealed that he was the most 'Resource Rich' farmer of the area. His farm was very much productive and the other neighbour farmers were following him, adopt modern technologies. It was revealed from the FGD that he was the key person with whom NGOs used to contact to disseminate a new technology.

Agri-entrepreneur Simanta opined '*I have reduced the costs of agricultural production by limiting the use of chemical inputs. IFS and IPM helped me a lot. I'm in this field since last 15 years. I attended more than 18 out of state training programmes*'.

Exhibit - 1 from Specific Case

Respondents in the course of their understandings, discussed and explained the strengths of Simanta's Farm-

- Resource rich farmer
- Highly educated
- Cosmopolitan sources of information
- Risk taking ability
- Skilled and well trained farmer
- Good marketing linkage
- Knowledge about farmer centric government schemes and policies
- Good connection with NGOs, KVK, ATMA, RRS and SAU.

The information accumulated through the FGD and Sociometry gave data on the 'data rivulets' inside the group and their explanations on various sources of information and social interaction pattern of Srimanta was analysed and represented through socio-gram.

Exhibit - 2 from specific case

The institutional networks and liaison at the grassroots, if utilized properly, can act as a change maker and able to strengthen the family based farms. Capacity building of the farmers having small farms may reinforce the food security at family level and empowerment at community level.

Impact on Family Level

If properly adopted with investment in maintaining improved yields without depleting natural agriculture, IFS improves the personal savings and health resources or destabilizing the environment. Integrated farming is a commonly and broadly used word to increased food production; social function in terms of explain a more integrated approach to farming as provision of employment opportunities for excess labour compared to existing monoculture approaches.

* Significant at 5 % level of significance
** Significant at 1 % level of significance

Table 2 depicts the correlation between food security and other independent variables. It has been found that the variables Size of the farm (X_5) and Contact with NGOs (X_{12}) had recorded significant correlation with the dependent variable food security while the variables Social Interaction (X_{14}) and Good liaison with Government Organizations (X_{15}) had significant and correlation with food security.

CONCLUSION

Farm size had positive significant correlation with food security because bigger the farm size more would be the resources of the family with more viability which will naturally lead to increase in food security. Contact with NGOs too had positive significant correlation with food security which indicated that the relation with NGOs would help them to raise their capacity through training, information and sensitization. It may be because the village dwellers, associated with NGOs had good access to information or may be because they were aware of the new technical and farm related information which was given by these sources. Food security is both biological and perceptual display of calorie intake balances, interaction pattern and liaison with Government Institutions. When one was crippled with food insecurity he was supposed to run with low social interaction and connection with institutions.

ABSTRACT

Enhanced data alone however is not adequate for enhanced basic leadership. Basic leadership is a political procedure and partner interest in basic leadership procedures is critically imperative. The SL approach is on a very basic level individuals focused and requests a point by point participatory evaluation of the qualities and data needs of target recipients and partners as an early action in program plan. This needs to connect with partners at all levels, advance two-path streams of data amongst them, and focus on the part of data in connection to various business resources. At long last, it finished up with a comment: Farm size had positive huge relationship with food security in light of the fact that greater the homestead size more would be the assets of the family with greater reasonability which will normally prompt increment in food security. The study was carried out in East Singhbhum, Jharkhand. Purposive Sampling is used here to draw the subset of population. PRA and FGD are the basic methods of data collection. Finally, the study divulges: Contact with NGOs too had positive huge connection with food security which demonstrated that the connection with NGOs would assist them with raising their ability through preparing, data and refinement. It might be on the grounds that the town tenants, related with NGOs had great access to data or might be on the grounds that they knew about the new specialized and ranch related data which was given by these sources

INTRODUCTION

To comprehend correspondence inside a Sustainable Livelihood (SL) system eludes to, as a rule, smaller scale large scale linkage accentuation. For further elaboration, bolster from the idea of AKIS (Roling, 1988; Engel, 1995 as specified by Skerratt, 1998) can be looked for. Roling (1988) characterized a horticultural data framework (AIS) as -a framework in which rural data is created, changed, gotten and nourished back in such a way, to the point that these procedures work synergically to support information use by agrarian producersand a rural learning framework (AKS) as -a arrangement of conviction, insight, models, hypotheses, ideas and different results of the brain in which the… experience of a man or gathering regarding farming generation is accumulated. Nonetheless, notwithstanding these, one can locate a more important and official/crossing over point from one of Roling's (1985) prior distribution, where he watched that a horticultural information framework cooperates with non-agrarian learning frameworks, money related and showcasing frameworks, with approach detailing and usage frameworks, with natural frameworks et cetera. This serves two of the present interests – to begin with, demonstrates a large scale small scale linkage understanding and second, approaches towards an idea much closer to work (learning) data framework. The study intends to track down the following objectives.

a. To find out the community network of Family Farming
b. To describe the role of social interaction in Family Farms

MATERIALS AND METHODS

Locale of the study area

Present study was carried out in Paamda of East Singhbhum, Jharkhand. Expanding on the portrayals of the institutional impact which farmers perceived and explained to the present researcher during data collection, this segment examined and figured out how institutional extension activities created positive changes by helping them to move towards the sustainability of their family based farms.

Initially, the aftereffects of a three round 'FGD based power mapping' practices, entitled as 'Shared Influence Analysis', directed in farmers and institution were exhibited, demonstrating farmers' view on the said topic.

FGD based power mapping

FGD held with selected farmers from the study area in each gave important bits of knowledge into the ways farmers were impacted by their association with various institutions. FGD discourses meant to examine the degree to which farmers feel engaged to comprehend the issues they confront and the components that empower and oblige farm dwellers from reaping better result from newly emerged technologies.

FGD exercise and data analysis

- Farmers were asked to find out the positive and negative impact of institutional attachment
- Preparation of the 'influence list'
- Identification of specific cases
- Transcription of FGD data
- Analysis from transcription -> segregation of thematic elements -> words, theme, character, repetition, quotes

RESULTS

One of the main focuses of the present investigation was to trace out the relationship between the group cohesiveness of the Self Help Group. Because, result of FGDs were suggesting that NGOs had been an impact on social inclusion at community level. To find out the group cohesiveness of the Self Help Group, the present

researcher applied the technique of 'Sociometry' and for applied the mentioned technique the investigator considered the frequency as score and the relationship between the group cohesiveness of the 'Self Help Group' and the empowerment of the SHG members was find out with the help of Pearson's Product-Moment Correlation.

As the value of *r* is - 0.656787465then it can be said that there is no such relationship between the group cohesiveness of the Self Help Group and the empowerment of the SHG members.

Significance of *r* is determined directly by consulting the table values of Pearson's Product-Moment Correlation. The table value of r at 0.05 level of significance and at 8 degrees of freedom is 0.643. As the computed value of r i.e. 0.656787465is greater than the table value, then the null hypothesis was rejected and we can conclude that the group cohesiveness of the Self Help Group and the empowerment of the SHG members were significantly correlated.

Community Case

Reviving the traditional farms at Patamda: A case of community movement

The community members of Patamda were not acquainted with alley cropping. Tagore Society and TSCSR introduced here alley cropping. In this area, mostly arable crops were suitable to grow. Alley cropping exploited the viability of arable cropping system. Arable crops were introduced in various alleys formed by perennial trees, set up on contours. Trees were acted as live bunds to control run off. Locally available stones were also used for bunding and to check run off.

According to the community members of Patamda, it was a relevant step which had a great impact on their farm sustainability. Advantages in terms of linking the community members with various institutions appear apparent.

Role of institutions apparently was acknowledged by the community members especially for technology refinement and promotion. It was revealed from the FGD that since 1980, Tagore Society was working there with multi-facet approaches, which arose from an in-depth understanding about the felt needs of the community.

Exhibit - 1 from Community Case: Drawing inference

Since, present researcher intended to ventilate the impact of the institutional initiatives in the case area; present researcher collected information from 24 farm families on the difference that has occurred in the yield before and after the institutional linkage.

In order to judge whether the change in the yield was statistically significant, we have undergone a statistical test. As the two variables under study (Yield in kg/acre) were scale variables and since the study intended to depict the difference in the yields before and after the introduction of the SRI programme, researcher had undergone "t-test: Paired sample for means" in SPSS.

Since, the farmers expressed their yield in different units, so ,in order to facilitate easy calculation all these units have been converted to kg/acre.

Statistical Hypothesis

Ho : The difference in the yields(kg/acre) before and after institutional linkage is not statistically significant
H1 : The difference in the yields (kg/acre) before and after institutional linkage is statistically significant
where, H0 = Null Hypothesis
H1 = Alternative Hypothesis

Critical Value

At 0.05 level of significance and degree of freedom 23, the critical value of 't' is 2.069.

CONCLUSION

The participants themselves identified and explained the different aspects of community level empowerment. These aspects were represented through five specific arms which were observed on a five point scale, where zero represented lowest level of empowerment whereas five was depicting the highest level of empowerment. From the study it was clear that institutional linkage stimulated empowerment at community level. The visual depicted clearly that community members had a lesser empowerment level (in all aspect), before they had linkage with various institutions. Role of institutions apparently was acknowledged by the community members especially for technology refinement and promotion. It was revealed from the FGD that since 1980, Tagore Society was working there with multi-facet approaches, which arose from an in-depth understanding about the felt needs of the community.

ABSTRACT

This work is intending to arouse an extent of controversy regarding challenges of Community organizations. Community organization or association is a valuable concern with endeavours to coordinate social assets successfully towards the particular or aggregate welfare needs any geographical zone. Its execution may include such activities as, real findings, coordination, enhancing benchmarks, understanding improvement, welfare programs, changing pattern of formative action or developmental activity and promoting social legislation. However, communities have various diversification of social ills, social issues or social problem. Through the community organization method, communities act like totality and working for irradiate the problems and bring the benefits of social welfare. Finally, the study tried to ventilate a concluding remark. It clarifies peoples' association and its impact. Consequently, people group association brings about strengthening of individuals. The strengthening encourages the group to remain against abuse, pick up the capacity to take care of issues and to accomplish the coveted objectives. A significant number of the monetary issues can be effortlessly tackled by community organization and strengthening of the community. Many times due to misbehaving of the institution the community cannot reach their goal. However, it is a participation process so the community involvement and their engagement can irradiate their problems.

Keywords: Community organization, SHG, MYRADA, FPO, Social organization

INTRODUCTION

The word 'Livelihood' can be utilized as a part of a wide range of ways. The accompanying definition catches the expansive idea of occupations comprehended here: A Livelihood contains the abilities, assets (along with both material and social assets) and action required for a means of living. A livelihood is reasonable when it can adapt to and recoup from stresses and stuns and keep up or upgrade its abilities and resources both now and later on, while not undermining the natural resource base. Livelihood is the most important part of any family as well as a community. However, the livelihood depends on five capitals i.e. physical, ecological, human, social and natural among the community. Each of the capital interlink with each other. These are the five wings of livelihood process.
Community organization or association is a valuable concern with endeavours to coordinate social assets successfully towards the particular or aggregate welfare needs any geographical zone. Its execution may include such activities as, real findings, coordination, enhancing benchmarks, understanding improvement, welfare programs, changing pattern of formative action or developmental activity and promoting social legislation. However, communities have various diversification of social ills, social issues or social problem. Through the community organization method, communities act like totality and working for irradiate the problems and bring the benefits of social welfare.

The people of community organizers built up an association with the individuals from the group which lead a review to determine the necessities and it includes the general population for the definition of plans and raising assets and executing them for the community social welfare and different administration services. The main priority of the community organization is for social welfare, whereas some scholar articulated that it should help to overcome the problem of poverty.

Through MYRADA and Market visit present researchers try to find out how a community is engaged in their own livelihood practices, on the other hand through the simulation exercise helped me to hand on experiences to the community association. Through that exercise help me to make a layout of livelihood status, participation in community organization, diversification, and different choices, risk and vulnerability etc. It also helps me to find out the role of the institution to the community organization and their livelihood interventions.

Livelihood Status

Through the real situation (MYRADA and Market Visit) we found that the poor peoples are circulated in between the trap of poverty. It also feels in simulation activity how a poor household copes up with the poverty trap. The poverty trap is act like low income gets low savings among the household and the investment amount also be decreased. As a result of their production rate also become decreased. The same picture is also visible in MYRADA field trip. The villagers have low assets or capital, so the chain of poverty trap exists. Though there is agriculture dominated livelihood lots of diversification in livelihood exist surrounding the villages. However, in the market visit, we found that those who have a small business, the earning capacity also very low but on another hand, big wholesaler or retailer have enough physical support to sustain their livelihood. Not only that they also have the strong social capital or social network, which helps them to gain maximum information as well as social benefit.

On other hand, gender role is also very important to livelihood. Ross & Sawhill (1977) said that in fact, a family is an economic unit and the family is a combination of male and female. They have equal chance to take a decision. They also said that to empower women or higher education of women in the family gives the result as economic improvement, it helps to improve the family status. If a family both husband and wife act as earning member then the family can be more sustain rather than one hand family member. Cheryl (2013) argued that there is a lot of evidence which addresses that women's bargaining power affect the developmental outcomes. There are many central advancement results which really depend on women's capacity or bargaining power to arrange ideal intra-household allotments of assets. So, women participation in livelihood is activity the most important factor. Similarly practically it also overlaps in the simulation exercise. Once the families have low capital (mainly physical) and they

do not invest more in the production model. As a result, the output came very low and for surveillance, they sold their land which means or it indicates that they fall into the poverty trap. Similarly, in the marketing chain, the middlemen create price differences among various commodities and its result directly affected to the producer and consumer. Beyond the field visit and market visit, it was found that those who have strong capital are more sustainable than the poor, who have less capital. So, each of the capital is important to create sustainable livelihood for community. So we can say that the rural livelihood is not just only poor income but also different diversification approaches. So we can say that the risk and vulnerability of any community same and it can be solved through the community organization.

Risk & Vulnerability

Risk and vulnerability or hazards have been restored as key highlights of rural economy or livelihood and poverty, and areas of now a concentration on policy or intervention (Stephen 2001). The poor themselves attempt to oversee vulnerability utilizing an assortment of ex-ante and ex-post hazard administration techniques, and through community supportive networks, yet these are both delicate and financially harming. Practically I also have seen the risk and vulnerability among the poor one. It could be ecological, geographical and also human creation risk. According to Kepe et al. (2004) and Wang et al. (2011), the connection between ecological conservation and poverty reduction has been the subject of intense debate among academics and practitioners for decades, to overcome these two inconsistent goals, both far and far away from reach. Water scarcity is the main problem of the village situation. In term of community organization risk and vulnerability is an important element for community development. However in community organization community as a client and they have the power to take the decision. So to cope up with the risk, communityitselfplays as a core element of the function. If we look up the MYRADA's intervention about water scarcity, water reservation facility can help to better irrigation facility and complement the drinking water purpose. Here the problem is about the whole village and it solved through community organization method. Similarly, the actual price of the commodity, market facility intervention can be done by the FPO; as a community organization.

Community organization as a participation action

Participation is defined as a collective action through certain process or decision making journey and it brings change or progress in developmental activity. On another hand, it community organization introduces itself as a collective action of the certain people. It helps to address the issues and realize and keep up alteration amongst requirements and assets in a community. So it is true that helping individuals viable to work with their issues and plan to understand their targets by helping them to create, reinforce, and keep up characteristics of the investment, self-course, and participation among each other and that is very difficult to manage each individual choice. Through that process, it brings a change among the community and individual relationship. As a result, it can distribute the decision making the power of the community members. Through the participation of SHG members can change their rational thinking. Now the members of the SHG members are financially viable and they can take decision among the individual and family level. Similarly, through the participation model community can make a political platform and enrich their decision making power as well as solve their common problem. So we can also say that community organization is a kind of problem-solving method, where the community people participate such kind of community development activities and reached at last their own goal. As an example we found in Russell market each of the specific commodities like tomato, fish, mutton market have their own committee, who have the responsibility to look up their market system and they have own problem, own issues, so the intervention should be perfect if their participation as well. So community organization is a collective process where the problem was solved by themselves participation and their activity.

Role of the institution in community organization

To organize any community, institution play very important role. The institution could be the government organization, non-governmental organization or other institution like SHG, JLG, and FPO etc. Generally, that kind of

organization makes a platform where a certain group of people can interact with each other and organized themselves. It could also very helpful in term of consumer awareness. As an example in Russell market we found that the association or body of the fish, mutton market helps to spread awareness (in term of market information i.e. price, quality, space, quantity) among the consumers and the seller. Similarly, MYRADA also working to the organized community and with no involvement of commercial activity, they try to intervene among their livelihood. They also make SHG for the women and organized themselves. Again come back to the water scarcity problem; the organization tries to gather the community people and intervene among them. Here MYRADA as a supportive agency who try to build up community organization and spread awareness among them. Thus we can say that institution is a very important factor for community organization.

Barriers of community organization

Generally, the poor and vulnerable people fell that they have no power. So they do not present them as a leader. But through the community organization, they feel they have the power to take decision among themselves. It develops their capacity and confidence, so they can solve their own problems. Though the community organization helps to empower them there is a lack of term of illiteracy, superstitions, caste division etc. It will take time to achieve the goal but the community people may have not sufficient time to engage with that. As a result, it becomes failure. Many times empowerment also act like a barrier, if some of the members are getting more benefit then they think they arepowerful; as a result, they exploit others and create violence. On the hand when individuals have organized themselves, they get the power. There are pioneers in the group and in the event that they are joined together, they can cooperate, and they can arrange with each other. This influences them to feel intense. Consequently, people group association brings about strengthening of individuals. The strengthening encourages the group to remain against abuse, pick up the capacity to take care of issues and to accomplish the coveted objectives. A significant number of the monetary issues can be effortlessly tackled by community organization and strengthening of the community. Many times due to misbehaving of the institution the community cannot reach their goal. However, it is a participation process so the community involvement and their engagement can irradiate their problems.

CONCLUSION

Community organization is a kind of space where the where the people come and organized themselves to fulfill their own goal. Simulation exercise helps to understand how and when the community organized. On another hand the MYRADA visit helps to visualize it. The local people organized and work with that, women's SHG made before 30; 20; 15 years etc. ago to solve their own problem. However, the market visit helps to understand through the community organization they can make a sustainable market where a people can access the resources. Families and groups join together and form communities. While working with communities we have to work with individuals, families, and groups.

ABSTRACT

Fishing, crab collection, honey collection and other NTFP collection is the main livelihood of Sundarban region. Lots of spices among the plants and animals disappear due to climate change. Previously there was only fear of animal but now local people have less access to natural resources. Presently, without consulting with local people the industrial community started accessing the forest with support of Govt. Therefore it shapes like violence among the Govt. and the local community people. Thus the political issue display in forest and the local community. Through Joint Forest Management (JFM) Govt. of India try to conserve the ecological system of the forest without hampering livelihood of the local people. The most challenging thing is that though JFM is a bottom-up approach, in practices it does not co-exist. Therefore we need to develop a well-designed management process to make extension services accessible to the local people.

Keywords: NTFP, JFM, Forest Resources, Sundarban, Fishermen.

INTRODUCTION

The Sundarban forest, world largest mangrove forest is about 10000 sq. km. spread over India and Bangladesh country. Over the total area of Sundarban forest, approx. 40% have in India. History says that due the small river and

the floating clay made this forest around six decade. Almost 334 species of flora and 450 species of fauna are stay this huge mangrove forest. People have made relationships with this forest for life and livelihood. Fishing, crab collection, honey collection and other NTFP collection is the main livelihood of that region. As a supplementary they also do agriculture in only one season of the total calendar year. However many environmentalist and scholar articulated that with climate change, mangrove forest bears degradation process of her bio-diversity due to human disturbance, industrial pollution etc. Lots of spices among the plants and animals disappear due to climate change. The main reason behind the climate change is decreased inflow of fresh water. As a result the salinity of that region increased and affects the agricultural land as well as forest plantation and the water bodies. Therefore the livelihood of local people affected and they become fall into the poverty trap. Continuation of this procedure in light of environmental change and sea level ascent represents a terrible truth to the carbon sequestration potential and other biological community system of this mangrove forest system in future. So the environmentalist or the researcher identified that due to climate change across the Sundarban forest the degradation process started as a result the productivity and the capacity of the forest and the land capacity also decreased. It also observed that the salinity proportion of the land and the water increased. However if we look up their livelihood pattern, discussed that the main livelihood of that region is fishing. They have the absence of ecological mindfulness and furthermore the word related dangers identified with their profession. It has been identified that fish production due to ecological performance and the occupation process highly risky. They should be ever aware of the earning risks and follow regulations and legislation adopted regionally or nationally. The occupational dangers, wellbeing nerves, and dangers to the strength of the fishermen are built of the sorts of operation, the size of generation and the particular types of intrigue. A major challenge is that unsustainable harvesting may increase to the riverine like fishes, crab, and prawn gathering. The accumulation of wellbeing of the community affected so far. As an excuse the Govt. also introduce that due to human intervention the tiger population affected. But the idea was constructed by the state and the battle is constructed by artificially to reduction access of the forest, create more right over forest and exploit them. However in term of right the local community have equal right over the forest but without compromising or without consulting with local people the industrial community access the forest with support of Govt. So that it create compensatory afforestation bill among them. Therefore it shapes like violence among the Govt. and the local community people. Thus the political issue display in forest and the local community.

Chowdhury et.al.(2008) find out that every fish or crab collection trip on the deep forest water ways have very risky and dangerous due to the tiger and crocodile offensive. As a result until the fisherman came back from the forest region their spouse praying to their Good, believes over their customs and worship lake fasting, putting the vermilion tidy on their appealing God. Therefore their livelihood and their lifestyle belong to high insecurity both social and ecological pathway. However, it was told that they were not only depending on fisheries but also they collect the NTFPs from the mangrove forest for their livelihood sustainability.

Singh et.al. (2010) pointed out that although they are engaging with fish collection but they also depend over the NTFPs (especially honey). Now the remarkable thing is that total livelihood system is based on the commonplace but due to presser of climate adaptability, the total community's livelihood faced same and terrible threats. Before that only wild animal fear was the main problem among them but now they also faced lot of threats in term of natural resource accessibility.

Findings

- Increasing salinity of water body leads affect to the water body's fauna (mainly fish and crab). So the production of fish or crab also decreased.
- It effects the honey production, medicinal plant and other non-timber product also.
- State becomes more challenging factor to accessing the NTFP.
- Either they have to use the forest as unsustainable way or they leave their traditional livelihood.
- Migration of villagers to city area and worked as informal labour.

Government Initiative

After introducing Joint Forest Management (JFM) Govt. try to intervene among that kind of political situation with the local people. Through JFM Govt. of India try to conserve the ecological system of the forest without hampering livelihood of the local people. However, the most challenging thing is that though JFM is a bottom-up approach, in practices it does not co-exist. There is an unstructured top-down system present in this scenario.

CONCLUSION

There is a least evidences that can be prove that the local people get their right over the forest. To provide various kind of information, extension services now need to take into account differing data and administration needs of the vulnerable group and extension institutions need to spread service more efficiently. This frequently needs institutional rebuilding at various levels of the extension services. Some precaution about conservation of forest leading with local people, environment degradationcan be reduced. Beside that we must look up over the external stockholders intervention. To conclude if we look up the overall summary it shows that the climate change leads environment degradation and therefore it create political issue among the local community and state. There has been broad affirmation of the way that conventional state laws on conservation zone protection can represent a danger to the standard aggregate privileges of neighborhood groups possessing these zones, instigating livelihood vulnerabilities. Therefore we need to make a good shape or well-designed management process.

ABSTRACT

Gender equality and women empowerment is an important part of development. Women are the backbone of Indian Agriculture and their work has been still unrecognized worldwide. Women are one of the most important resources in agriculture. This paper is drawing an evidence of women's work participation in cultivation of Paddy and Mustard in a year. The analyze data shows that in the cultivation of paddy the women participate 54.4 percent of the workforce whereas the men comprise 45.5 percent of the workforce and their (women) total workforce is 1.2 times more than the men and in Mustard cultivation women participate 50.83 percent of the workforce whereas men engage 49.16 percent of the workforce. Calculating the total workforce in cultivation of Mustard it is seen that women's participation is 1.1 times more than the men. Apart from that ploughing step is predominantly men's activity which is more than women but in transplanting and weeding steps women are engaging much more than men which is quite a lot remarkable. Over all labor participation of rural women in agriculture and food production is exceeding the men's burden and is significantly increasing day to day. Women are making more contribution to agriculture and their diversity of work is observable but the work is still generalized and unrecognized. Hence, their (women) burden of work, time use in the committed work and the diversity of the work, keeping these in mind it is necessary to give them value for their labor/workforce.

Keywords: Women, Men, Paddy, Mustard, Agriculture workforce, Time use, Gendered nature.

INTRODUCTION

One of the most important principal of rural livelihood is agriculture and its allied activities. The word 'farmer' and the image which is coming to our mind immediately is that a man is working on farm land but the scenario is different now a day. Two villages (Tilabani, Taldi) of Purulia district are surrounded by tribal population. These tribal peoples' livelihood depends on mainly agriculture. Every household of those villages has their own land and they cultivate it by themselves, sometimes by hired labour. Both male and female share their labour in agricultural production. According to (2001) Census the total population of India is 102.87 crore, wherein, the male population is 53.22 crore and female population is 49.65 crore. Most of the women contribute their labour in household income through farm (landless agriculture labourers) as well as non-farm activities. Despite involvement in domestic work, the women contribute their labour force in farming related activities. Spending time in household work is not considered as valuable work and no credit is gone to the women household worker for those works. Traditionally, women do the exclusively tedious, time and labour intensive works like sowing, transplanting, weeding and intercultural operations, harvesting, threshing, transportation and post-harvest operations like shelling, cleaning, grading and processing etc. All these jobs involves considerable amount of drudgery, because it is mainly done manually (Shilparani, 2007). In most Indian families daughters are viewed as liabilities and on the other hand sons are considered as idolize and celebrity. In addition to the patriarchal culture, common in different degrees throughout the world, is the equally common problem that while women typically carry out most of the work inside as well as outside involved in caring for the home such work is given little or no social or economic importance, and as a result, women are perceived with little importance. While the work done by men is widely acknowledged and most men are considered as economically productive, women who are engaged in household work and farming work are classified as economically unproductive. Agriculture is the dominant occupation in rural areas and its activities are seasonal, many women join the labour force during the sowing and harvesting seasons and withdraw on the face of non-worth work (Acharya; Mathrani, 1992).

Damisa et.al (2007) highlighted in their study that despite of various social, economic and various other constraints women have high level participation in agriculture and they are very committed in their agricultural activity. Overall the level of involvement of women in farm decision making was found very medium. About 60 per cent of agricultural operations like sowing of seeds, transportation of sapling, winnowing, storage of grain etc. are handled exclusively by women, while in other jobs they share the work with men. Apart from participation in actual cultivation, women participate in various forms of processing and marketing of agricultural produce (Aggarwal, 2003). Within agriculture labour force, the proportion of women is more compared to men and their contribution in agriculture and farm activities is also greater (Arunkumar et al., 1994). Roy (1992) found that the incidence of women agricultural labourers is not only very high in Bihar, but there are wide variations among the different districts in this regard.

Although there is large divergence in the incidence of women labour even within the plains of Bihar, it is generally higher there than in the plateau region, which has substantial proportion of scheduled tribes. Hence, the present investigation aims at time utilization by women as well as by men in crop production during two certain seasons of a year. Singh and Vinay (2012) briefed in their working paper about the significance of female labour in agriculture and allied activities. They further stated that the role of women in agriculture as female labour is not highlighted in India. In spite of their presence in activities sowing, transplanting and post-harvest operations they are considered as an invisible workers. Women have played and continue to play a key role in the conservation of basic life supporting systems such as land, water, flora and fauna. They have protected the health of the soil through organic recycling and promoted crop security through the maintenance of varietal diversity and genetic resistance. Therefore, without the total intellectual and physical participation of women, it is not be possible to popularize alternative systems of land management to shifting cultivation, arrest gene and soil erosion, and promote the care of the soil and the health of economic plants and farm animals (Prasad & Singh, 1992). MunMun and Arindam highlighted the facts that women participation in agriculture is increasing with time and women are now acknowledged with the status of "agricultural worker". Though discrimination of wages and in working status still prevails for women labour but

due to implementation of various policies and initiatives taken by government the invisibility of women as an agricultural worker is plummeting and will further diminish in future (MunMun and Arindam, 2014). Hence, the present investigation aims at time utilization by women as well as by men in crop production during two certain seasons of a year.

Objectives

1. To identify the gendered nature in cultivation of Paddy and Mustard during Kharif and Rabi season.
2. To compute the time use with respect to the above male and female farm labour.

METHODOLOGY

The present research work has been carried out at two villages of Purulia district of West Bengal during 2017-2018. During this work 25 farmers (male & female) were interviewed to collect the primary data. The method which is used is the qualitative and quantitative method of data collection. For the sampling, purposive sampling was carried out, to reach the respondent to collect the data snow ball sampling was used for getting the more data. In quantitative method the selected population information is analysed through statistical method. The analysed information has been arranged in tabulated form and interprets qualitatively to get clear information about that study.

RESULT AND DISCUSSION

Research has been done with the engagement of male & female farmers with different steps of cultivation of two different crops in a year. Hence, the salient findings of the study have been presented and discussed hereunder through different tables and figures.

Table-1and Figure-1illustrated that in terms of transplanting; weeding women contribute more than men. It astonishes that in transplanting step women participation is 2 times more and in weeding step women participate approximately 11 times more than the men. Apart from that in ploughing step only men participating 3.5 times more than women. Focusing on overall step it is found that women contribution in paddy cultivation is more than men.

Table-2 elaborated that in ploughing step men are contributing 4 times more than women and in Fertilizer/pesticide application women contribution is approximately 2 times more than men but in terms of overall participation it is found that women participation is more than men. During analysis the data it is seen that a man worked for 1595 hours in a year in one hectare of land whereas a woman worked for 1789 hours in a year in one hectare of land for the cultivation for Paddy and Mustard. Apart from that, Men were found to be doing 47.14% of the work whereas Women were found to be doing 52.87% of the work in cultivation of Paddy and Mustard in that area. It is also found that in overall participation a woman works 1.13 times more than a man.

CONCLUSION

Rural women are the major contributors in agriculture. Her range of work varies from crop production to livestock rearing and home maker. In spite of doing hard work or spending more time in agriculture it is still considered that women are not economically productive. After analyzing the data it is found that overall participation and time spend in cultivation of Paddy and Mustard during agricultural season women's work participation is more than men and their work should be recognized and considered as economically productive work. Women do the time & labour intensive works like sowing, transplanting, weeding and intercultural operations, harvesting, threshing, transportation etc. All these jobs involves considerable amount of drudgery, because it is mainly done manually. Finally I would like to conclude that women are equal to men, even this study shows that women are not only the

same as men but also they (women) are more hard worker, more committed than men in terms of work, in terms of time spend in different types of work.

ABSTRACT

The new way to deal with community development gives a change in perspective in the conventional methodology where the job of the administration is transformed from that of administration to assistance. It visualizes a base up approach whereby the dwellers' involvement themselves chooses their plan of action. Village improvement is a constant, pluralistic and broadly participatory procedure and fundamentally implies, progression of a territory, uncovering, unfurling or opening up something which is dormant and a change that is alluring. In spite of this, often people are not participating in developmental activities. Present article highlights the fact that Often to develop a good Development Plan one needs to do some activity which doesn't have any direct benefit to them, but have a great indirect benefit like the PRA activities. The challenges to collectivizing them are come from different angel like Women's participation, class, caste, religion, occupation of people, gender, political influence, literacy rate. These are all the problem came from the community itself. Some problem may also come from the team who is working there for development activities. Not only problems, but also the authors intend to ventilate some solutions. The faith on the team from the community side is very much important. If the team failed to build the relation or faith with the community then the Participation of the people will be nothing.

Keywords: Community Development, PRA, Village Development Plan, Participatory Planning

INTRODUCTION

Collectivizing community is the most difficult task to do any community program. The community participation depends on the work done with the community. The community based on different kind of people different mind-set of people. As per definition community is small or large Social Unit in a particular place which has something common like values, norms, religion, identity etc. But when we face the community in a village or any other place it seems to very diverse and mixed up different kinds of people are came together to form a community. The development action is the activities which people usually do with the people to develop them. Often the participation in development action is voluntary and need their important time.Thill (2011) led an investigation on model village and its supportable characteristic asset the executives, town self-administration, present day arrangements, participatory turn of events, movement, social value, bounty and genuine majority rule government of Ralegan Siddhi, situated in the drylands of Maharashtra. Anna Hazare, the famous social dissident has been the principle head behind the village development.Majumdar (2016) depicted in his study: It was discovered hard to credit to a specific plan/program the reasons of progress or disappointment in the formative procedure. Henceforth, in a workshop sorted out under the aegis of the Planning Commission in which the main NGOs and other rumoured establishments had additionally in a view was taken to embrace a territory based methodology for the assessment of the effect of the different plans of the Government of India. It is therefore the current examination has been done to record Angara square, Ranchi area, Jharkhand so as to consider Socio-monetary condition, populace and asset situation and to get ready collective intends to make a supportable model town. During the participatory exercise, the scientists understand the status of the locals during the whole course of movement on the grounds that the 'stick of control' was given over to them.

Problems to start a Community Action Plan

Often to develop a good Development Plan we need to do some activity which doesn't have any direct benefit to them, but have a great indirect benefit like the PRA activities. The challenges to collectivizing them are come from different angel like Women's participation, class, caste, religion, occupation of people, gender, political influence, literacy rate. These are all the problem came from the community itself. Some problem may also come from the team who is working there for development activities. The faith on the team from the community side is very much important. If the team failed to build the relation or faith with the community then the Participation of the people will be nothing.

Citing Example: Experience of a student of Azim Premji University

From our field experience the challenges we faced like, in our market visit we visited the place in the pick hour of their business, so the people were not willing to talk with us by keeping beside their business. So here time also play a big role to collectivizing people. In the whole market there were no women present. But we have women in our group, some of them was surprising to see the women there, some of them also didn't talk at all with the women. But when the women approaches to the people they didn't ignore they replied. But whenever they voluntary ask anything they ask them male person of the group. Many of them don't know about Azim Premji University and the course like Development. So the hesitate to answer, but in the same market we also find some people who know something about this type of project and field they helped us a lot. So here we can see the problem of reputation and knowledge works. When we visit the villages through FES, we saw a more people's participation there. It is just for only the reputation FES has there and the workers of FES earn the faith of the community of that area. In the beginning there was lot person they may thought that some new people came so we can get some new thing from them, but when we start doing our PRA the people start leaving the place. At last only few was left in that place to complete our work. That the case of productivity, whenever we have some productive for them they will be there for you, but this kind of thing which don't have any direct profit they doesn't show such interest to the activity. If we do any activity during their earning season we get least participation from the community.

The rural Poor people need money; they want those type of activity which will give the monetary benefit. So whenever we plan something we have to plan such a way that will help the people to income more directly or indirectly. In FES visit we see one point about language that language of the development action provider also has a great impact on the collectivizing process.

Everyone now agrees to the fact that increasing population and land fragmentation is going to affect human managed systems as well. Farming systems, in particular, is vulnerable to such changes. Since living has become more complex than before, human need, specifically food habits, has also been shifting rapidly and among the people consensus is on the move that alone farming cannot meet these growing demands of the people.

Proper communication, better grass root level penetration, cosmopolite source of information, regular involvement in different group and community activities had an important impact in enhancing livelihood, economic security and agricultural development. Without a good income it is difficult to sustain a livelihood, economic security could also not be maintained without proper income. If an individual is exposed to different activities and information sources in the society, he will be aware of certain things which will ultimately help in sustaining livelihood, maintaining economic security and agricultural development. Contact within the periphery is also an important factor.

Community Participation

Better mass media exposure, better interpersonal source and better interactive information are also an important factor in enhancing livelihood, economic security and agricultural development. Sufficiency in livelihood and economic security as well as agricultural development could be depicted through body language. Contingency communication, with its peripheral and cultural attributes also plays an important role in livelihood generation, economic security and agricultural development.

CONCLUSION

It is clear that institutions should vibrate the present condition of farm dwellers. It would create an impact on individual, family and community level. At individual level, institutions should help to raise yield, income and reliance of the family farms. At family level, institutions should ensure food security, sustainability and the role of women. According to peoples' perception, social inclusion and empowerment should be the ensured by the institutions.The problems here mentioned are the broad problem which a development practitioner has to face during his work. The problems have to know before hand before going into field to avoid problem faced during the activity. Need to know about the area and the people also reduce the challenges faced during collectivizing the community.

ABSTRACT

Present study expects examine sub-sector analysis of 'Potato' in the Burwan Community Development Block in Murshidabad District. Production and Marketing are two Different things but are connected with a strong bond. Both are Complementary to each other. West Bengal is Second Highest Producer in the country but in every year lots of farmer getting fewer prices for their production, the issues like storage problem and export to other state are normal in every year. In West Bengal the marketing problem is more prevalent than the Production Problem. The main Market Problem is due to the middleman present in the chain. The farmers get very less amount due to this long chain of Middle Man known as *Forias*. The study is based on Quantitative and Qualitative both. Data Collection Methods was be based on Semi-Structure Interview and Focus Group Discussion. The Respondents were mainly Local Farmers, Traders and Market Operators. Snow-balling (will start the process from potato wholesaler) sampling method was applied for the Current Study. The Project was focusing to find the marketing channel of Potato in Burwan Block. This project may help the future work which will be done on marketing process or to find the problem in marketing. The work will give the proper idea of factors involving in marketing process and to find out the problem within the process. The project also help to focus on the role of Middle man in the marketing channel and help to eradicate the mal practice by the middle mans and wholesaler. The monopoly or duopoly can be successfully addressed through this study.

Keywords: Potato, Sub sector analysis, West Bengal, Middle man, Markeing linkage

INTRODUCTION

Potato belongs to the Solanaceae family, scientific name *Solanum tuberosum.* Among all the vegetables Potato is the most famous vegetable. Potato is the highest growing vegetable in India. The crop is used as a food crop as well with using as vegetable. The origin of Potato was in Andes in South America. According to FAOSTAT Data, 2018 India is the Second largest Potato producing Country in World. The Potato is very much reach with starch. The Nutrient content of Potato per 100 gms is,

1. Water	74.70
2. Carbohydrates (Starch and Sugar)	22.60
3. Proteins	1.60
4. Fiber	0.40
5. Fat	0.10
6. Minerals	0.60

Source

Potato in India, Central Potato Research Institute (CPRI), Shimla. In India Uttar Pradesh, West Bengal and West Bengal are the leading states on Potato growing. In India we use Potato with almost all type of Vegetables. Samosha, Masala Dosha, Alu Pratha are the most famous recipe of Potato. Potato is a mainly Rabi Crop, but now this days Kharif Potato also start cultivating. Potato sowing use to start in November-December and harvesting done in February-March. This is a subsidiary Crop. Except the northern districts of West Bengal in all districts Potato is cultivated. Hoogly, West Midnapore, Murshidabad are the leading districts in Potato production.

The Farmer sells the potato to the local middleman known as *Phorias* in West Bengal. Sometime the local cold storage owner also buys the whole potato from any farmer and act as a middle man. The Marketing process id followed by the chain of certain middleman to reach the ultimate consumer and most amount stored in the cold storage for future selling. The Storage was also done by the middle man. The middle man buy the product from the just after harvest.
There are a lot of problem is present in our current marketing System. This current study will focus on prevail Sub Sector in the study are and try to find out the problem within the Sub Sector. The price of the Market is very much fluctuating according to the marketing channel and the season. But the main profit use to go to the middle man, the producer didn.t gets any profit due to high price in retail market.

Main Objectives

To understand and conduct sub-sector analysis of 'Potato' in the Burwan Community Development Block in Murshidabad District.

LITERATURE REVIEW

There are different constrains of Potato Marketing in West Bengal. High marketing cost and margins, wide price fluctuations, existence of large number of middlemen, storage and transportation bottlenecks and lack of other marketing infrastructures are some constrains listed. They noted Potato Market as an oligopolistic in nature where commission agents dominate (Pandit et. al, 2003).
Price fluctuation is a common phenomenon in case of seasonal and perishable commodities like potato (Sharma and Sharma, 1996; Malik et al., 1995).

The price fluctuations are very important component for both for producers as well as for consumers. The growers have to sell off their produce as quickly as possible after harvesting because of perishable product and the oncoming hot summers. It is not possible for them to take the advantage of high prices during the off-season. Traders and big

farmers earned more profits by storing the potatoes and sell them in off-season moths. On the other hand price fluctuations in retail level effect the ultimate consumer (Arya, 1995).

Some of the conditions for effective potato export are economic feasibility, comparative economic advantage, quality standards, availability of export surplus, development of infrastructure relating to transport, storage and processing, organizational arrangement for export and export-import policy. For tapping the foreign markets we have to be more quality conscious, should have a state-of-the-art market infrastructure and long term export strategy (Dahiya and Bhati, 1992)

Potato has to go through a number of intermediate markets to travel from the producer to the consumer. But apart from the wholesale markets at various stages and the final retail market, there is an active bond market for potato (Mitra and Sarkar, 2003). Indian farmers typically depend heavily on middlemen particularly in fruits and vegetable marketing. The producers and the consumers often get a poor deal and the middlemen control the market, but do not add much value. There is also massive wastage, deterioration in quality as well as frequent mismatch between demand and supply both spatially and over time (Subbanarasiah 1991, Singh M et.al. 1985).

The Producer --Wholesaler – cum – Commission agent - Retailer - Consumer is the major marketing channel for Potato. More than 60% of total production marketed through this channel. The major constraints for Potato growers are higher production expenditure, higher price fluctuation, lack of marketing information and lack of transportation facilities. To overcome these problems, the provision of cold storage facilities to the farmers at village level, adequate transport facilities for the export of Potatoes, availability of market information to the farmers, establishment of vegetable co-operative marketing societies and fixation of minimum/maximum prices of potato as well as other vegetables are some of the means suggested to improve the efficiency of marketing of potato in the state (Jadav et. al., 2011).

Study Design

The study is based on Quantitative and Qualitative both. Data Collection Methods was be based on Semi-Structure Interview and Focus Group Discussion. The Respondents were mainly Local Farmers, Traders and Market Operators. Snow-balling (will start the process from potato wholesaler) sampling method was applied for the Current Study.

Selection of Study Area

West Bengal is selected purposively as West Bengal is the second Highest Potato Producer in Our Country according to Monthly Report, May 2018 by Horticulture Statistic Division. Among all the districts in West Bengal, Murshidabad is a leading Vegetable grower in West Bengal. The Block Burwan is selected as it is the Second Highest Potato Producer in Murshidabad District according to District Statistical Handbook 2014, Murshidabad. Also, the study area is selected to avoid Language barrier.

RESULT AND DISCUSSION

The project work was done in the Burwan Block of Murshidabad District in the time period from November to December 2018. The project was targeted to find the Sub Sector of Potato within the Burwan Community Development Block. The study was done through Snowball sampling method in three layer i.e. Wholesaler, Farmer and Retailer. Total No of Respondent was Wholesaler 11, Retailer 17 and 23 farmers. The above mention chart is an overview of the Sub Sector in this Block. The Burwan Block Potato market is Potato market in the Murshidabad District. The Burwan block is west most part of Murshidabad District. The area is very well known for its farming activities, especially for Potato. This area falls under the Mayurakshi river basin, which is known for good quality alluvial soil and the floods happen almost every year, helps the field to enrich themselves. The Burwan block has its four main village, those are Burwan itself, Dakbangla, Panchthupi and Kuli. Dakbangla is no itself a village, the

village name is Gram Salika. The Burwan block has very good road connectivity with other part of West Bengal. Badsahi Road connecting Durgapur express way and NH34 went through the middle of this block. Nearest railway stations are Rampurhat, Sainthia and Salar. The whole trade is done through the Dakbangla Market. Sunil Ghosh and Sushil Jain are the two main Potato seed traders in this market.

The Seed Potato Sub Sector is a part of the Main Sub Sector. I represent it separately to get a better understanding. The region is mainly cultivated the Hybrid variety of Potato i.e. 'Pokhraj'. The other varieties; like Jyoti, Chandramukhi also cultivated but in a very less area. The Hybrid Seed mainly imported from Punjab. There is a monopoly of seed farm, who supply seed potato to the wholesaler in Dakbangla. There are only two wholesalers in Dakbangla who import the seed directly from Punjab. But there are at least 10 to 15 wholesalers who use to sale Potato Seed in Dakbangla and Burwan. The farmers have a good social relationship with any or some of the Wholesaler and they used to buy seed from that wholesaler only. The price of the seed potato is decided on the basis of the current rate of Potato. The price of seed potato used to stay low than the current price of market. If the price of seed potato goes high then the old potato which was stored came into the market as seed potato. The yield rate of this two has some variation, so they choose the new F1 hybrid Variety generally yet there is no such price deference. As an adjacent block to the other district the wholesaler also sell the seed Potato to the nearby districts. The sold the Seed Potato to the local farmers in a slight higher rate. The price of seed potato varies from 200 to 350 rs/50kg Bag depend upon the weather condition and market condition. Transportation authority helps a lot to bring the Seed Potato from Punjab to Burwan. That is an integral part of this Sub Sector chain also.

The potato market is fully depending on the weather and market of adjacent state. The market is totally controlled by Public no government authority either APMC or Food Commission doesn't play any role. The storage activity has a great role in this marketing process also. Government has a role to fix the opening and closing date of cold storages and the rate of Cold storages. There is no auction process happen for Potato. Farmers sellthe product to any wholesaler where he can find better price and can store the potato by their own. If we divide the farmers into two part i.e. small and big then we can again find two different technique of selling Potato. Big farmer sale their product directly to the wholesaler or store it into the cold storage by their own by making a 'Bond'. Function of the Bond I will discuss later. The big farmer sometime has a good social relation with the wholesaler so they usually sell the product to them only. In every village there are a group of people who are the farmers or sometime not the farmers; they play the role of middle man in the villages. There are some fixed people who known in the villages as a middle man and that is their occupation. But there is no fixed middle man there; any people can emerge as a middle man at this time. Who collect some Potato from the local small farmers and take them all to the wholesaler in Dakbangla and Burwan town.

The local middle men are known as 'Forias'. The selling of Potato is not there main occupation, some of them have shops, some of them are farmer who do this activity in every season. The Forias all time not sell the full product to wholesaler, some time they also store the product in cold storage for better price. Mainly the small farmers sell their product to the Forias for immediate cash and not taking the responsibility of transporting the product to the wholesaler. The numbers of Forias aredepending on how much the production happens and other factor. There is fixed no of Forias like the wholesaler. From wholesaler side they give two option to the farmers, one the farmer should come with their potato to their shop and sell it to them and sometime the wholesaler come to the field and check the quality of potato and buy it from the field and take it to his shop by his own transportation. In this two case there are some slight price differences happen. The price obviously depends on the quality of potato, size of potato not on the amount produce. The Sub Sector has different stage to reach the consumer and in every stage the price of Potato get revised. The Price has increased in a large extend when the potato stored in to the cold storage and then marketed. The pricing of the potato is fully depending upon the market outside. Like Uttar Pradesh market. Uttar Pradesh is the highest Potato producing state in the country and West Bengal is Second. So the pricing in west Bengalis very much depend on the UP Potato market. The big wholesaler also export the potato to the neighbouring state depend on the price. The local market price is depending on the Bankura Potato market price.

When someone stores the potato in the cold storage they make a Bond of that potato. In the Bond it is written like the amount of Potato stored and the price of potato when it is stored. The owner can sell the bond to any one and then the other person will be owner of this potato. The big farmer sometime does this technique to get more prices. In Cold storage we need a huge amount of labour. Storing of Potato and when it comes out it needs a dry period by spreading in a place and again to pack it. This whole process need some labour, all the cold storage provide the labour by charging the money from the Potato owner. In Burwan Block there are two cold Storages. They follow the government prescribed charge for storing Potato. It varies from 70 to 80 rupees per bag. The rate is same if anyone store it for 3months or 9months. The transporter also have a huge role in this whole process like take the potato from field, taking it to store, from store to market. In every stage it needs the transporter. The some wholesaler has their own transport and some have to rent the transport.

The selling price of Potato starts from 100-200 rs/50 kg Bag from the field and reach up to 250-1000 rs/50 kg Bag in Local market. The whole price increasing is due to different stage of Sub Sector and the storing cost.

CONCLUSION

The Project was focusing to find the marketing channel of Potato in Burwan Block. This project may help the future work which will be done on marketing process or to find the problem in marketing. The work will give the proper idea of factors involving in marketing process and to find out the problem within the process. The project also help to focus on the role of Middle man in the marketing channel and help to eradicate the mal practice by the middle mans and wholesaler. The monopoly or duopoly can be successfully addressed through this study.

ABSTRACT

Artisans who indulge themselves in this source of livelihood cast clay dough into making varied types of products. Potter communities transform clay dough into vessels and utensils, while there is another group of artisans who make mythological idols. There is another group of artisans who are observed to make small dolls, toys, sculptures, miniatures of mythological idols etc.However, not much focus has been given by researchers in this field as this a slowly dying field. This study was carried out in purposively selected hamlets of clay doll makers in Krishnanagar, Nadia district of West Bengal. Both primary and secondary sources of data were used for completing this study. Finally, the study reveals some technological aspects of doll making industry. There have been some technological innovations in the process of clay doll making over the years. A soil mixing machine is used to bring in the right consistency of clay. However, the artisans do not make much use of this machine since they prefer hand mixing of clay. Casting machines are used by artisans to cast bronze dolls and figurines. Gas burners are used to dry the clay figurines when there is deficit of sunlight during the monsoons. It is also used be artisans to speed up the process of doll making.

Keywords: Clay dolls, Krishnanagar, Mythological idols, Soil mixing machine, Potter communities.

INTRODUCTION

The initiation of clay doll making emerged in West Bengal during the era of British Rule when Raja Krishna Chandra Roy of Krishnanagar, Nadia District developed an interest in art and music. He brought in communities of various artisans and craftsmen from Dhaka and surrounding areas which included potters, clay doll makers, idol makers, musicians, etc. have resided in various hamlets of the district for generations now. Earlier, they used to reside in

different hamlets according to the castes that they belonged to but presently, however, intermingling of the caste groups have taken place thus bridging the gap between the groups.

Clay doll making has been a prominent source of livelihood for several communities from different districts of West Bengal such as Purulia, West Midnapore, Burdwan, Birbhum, Murshidabad, Nadia and Kolkata. Kumortoli in Kolkata and Krishnanagar of Nadia have gained popularity for mastering proficiency in idol making and clay doll making respectively. Exhibitions of clay dolls of Krishnanagar are hosted in several countries.Paul (2017) in his article discusses about the fact that with the emergence of an alternative market dolls i.e., dolls made of plastic and fibre dolls, have decreased the demand for clay dolls. The cost of production and the time taken in producing each units of dolls in this new sector is much lesser than the traditional dolls thereby widening the gap between the market value of both types. He further argues that the work done behind making clay doll is extremely laborious and exhausting. Also, the occupation is seasonal in nature as the clay gets dried up very easily in the summers causing it to break; thus there is a tendency among the artisans to switch to an alternative source of livelihoods like construction work. In some parts of West Bengal, it has been observed that some communities of artisan migrate in search for better standards of living or they migrate to places where there is a higher demand for the skill.

The artisans also work in very compromising conditions with poor infrastructure with middlemen often exploiting the artisans by not paying their dues. Clay doll making reflects the thought process and perception of the artisans and often represents the stories of certain caste, class or community of the society or reflects the myths and beliefs of a region. Majumdar (2016) talks about the livelihood of wooden doll makers and how their monopoly in the market is lessened by the day because of the emerging love for Chinese products among the public. The government and the handloom industries helped in shaping the journey of doll making was established but owing to factors like rapid urbanisation, advancement of technology and the interference of the Chinese market has led to the artisan's product and this heritage art of Bengal towards destruction. Through a gendered perspective, men are observed to dominate the carving of the the teak wood and make a shape of the doll while the female population engages themselves with the painting of the products. He mentions that as an alternative livelihood, doll makers often involve themselves in their ancestral lands but however, some families solely depend on doll making. They reach out to the market either individually or they form a cluster of artisans and the mass produce from the cluster is sold to the consumer. Jana (2015) in his study on the community of the clay-doll makers of Nadia, West Bengal talks about the factors leading to product development which financial assistance to improve the quality of the product, marketing and the communication with the consumers, proper infrastructural facilities such as packaging and storage, weather conditions suitable for doll making, etc. In his study with the respondents he understood the need of the artisans to be up-to-date with technological innovations, consumer demands, etc. so that can manufacture products without incurring major losses.

Hazra (1991) discusses how the needs and demands of the higher classes do not match with the traditional heritage and culture of art in West Bengal. He also mentions Similar to the other authors, it has been also mentions about the commercialisation of plastic puppets, soft toys and modern dolls through Chinese dumping has led the potter and artisan communities of Bengal in a vulnerable condition. Apart from this, factors like the government's efforts in safeguarding the art has lessened considerably, rapid urbanisation and modernisation in individual consumer's choices has led to the drastic decrease in the demand for clay dolls. Hazra (2017) in his article explores the fact that the unavailability of a proper market with enthusiastic consumers who feel passionate about the craft has influenced the decline of this art and cultural heritage of Bengal.

Objectives of the study

- To study the challenges faced by clay doll makers.
- To understand the livelihood diversification adopted by the artisans.
- To study how gender plays a role in the clay-doll making process.
- To understand how technological innovations in the doll-making process have impacted the lives of the artisans

METHODOLOGY

The research was a qualitative study which was conducted through in-depth semi-structured interviews with the respondents. I have had interactions with 15 independent artisans and 5 contractual labourers in a hamlet named Ghurni in Krishnanagar. However, since the population of the hamlet have been associated with same source of livelihood for decades now, the responses of the respondents have been similar. The residents of the hamlet face similar issues with their livelihood that is connected to clay doll making.

FINDINGS

Age

Most commonly it was observed that the artisans who associated themselves with the craft were essentially mid aged. The younger generation rarely associated themselves with the craft since they engaged themselves with salaried jobs. The scope for career growth has become very limited over the years owing to the decline of the culture of clay doll making. Of all the artisans I have interacted with, 9 artisans were from the age group of 31-50. There were 8 artisans who were aged more than 50. There were only 3 artisans who were aged less than 30. Supriyo Pal, 28 after completing his graduation had got into the business of clay doll making. He said, "I had to take up the family business after my father's sudden death so that I can support my family financially".

Education

Owing to critical financial situations in households and travelling long distances to access education it was observed that two out of the nine artisans from the older generation were illiterate and have had no formal education. However, three artisans have been able to complete their graduation from the same age group. Others have had to leave their education in between in order to financially support their families. A common pattern observed among the mid-aged artisans was that they have just been able to complete their education up to standard ten. This generation although envisaged themselves to be further educated and pursue different careers but were unable to do so due to familial responsibilities. Among the 3 young generation artisans, only one was able to finish his graduation while the other two had just been able to complete their primary education. The younger generations of artisan families in Ghurni hamlet have access to good schooling with advanced infrastructure and comparatively lower fees which are why they are mostly graduates. However, none except one artisan had any formal education on the craft of clay doll making. All artisans have mastered the skill from their early childhood through the help of their forefathers. The exceptional case of Gautam Paul is noteworthy since he coalesced the traditional craft of clay doll making with contemporary art forms through his formal education in Accademia di Belle Ardi di Brera, Milano in Italy.

Caste

Earlier when clay doll making was in its emerging stage, only the Pal community (who belonged to a higher caste) were the ones who associated themselves with the craft. However, with generations of artisans making use of this craft as a source of livelihood, a lot of intermingling have taken place. People belonging to other communities such as Mullick, Bagdi communities, etc. who are from lower castes now connect with the craft. People who are indirectly involved in clay doll making process: Other than the stakeholders which include the artisans and the entrepreneurs who run their own studios, and consumers, there are other people who are connected with the process of doll making. Rickshaw pullers are responsible for transporting soil from the fields to the studio of each artisans for which he receives Rs. 200-300 for each trip that he covers. Soil mixing labourers are accountable to remove unwanted objects from the soils and making clay doughs of the right consistency. They get a remuneration based on the amount of soil that needs to be segregated and mixed which ranges from Rs. 100-300. Painters give the finishing touch to the clay moulded dolls and other products. They are also compensated on a contractual basis where they have to paint an average of 450-500 dolls for which they receive Rs. 800-1000. Middlemen also play a role in the

process of clay doll making where they connect the artisans to the wholesalers and consumers. They make individual profits in the business.

Changes in the process of clay doll making

Technological innovations: There has been some technological innovations in the process of clay doll making over the years. A soil mixing machine is used to bring in the right consistency of clay. However, the artisans do not make much use of this machine since they prefer hand mixing of clay. Casting machines are used by artisans to cast bronze dolls and figurines. Gas burners are used to dry the clay figurines when there is deficit of sunlight during the monsoons. It is also used be artisans to speed up the process of doll making.

Quality of paints

Earlier, natural colours were used to paint the dolls but they did not have a long lasting effect and the colour would very easily faded. Also, there weren't a lot of options to choose among the natural colours. With the evolution of acrylic and synthetic paints and primers, there has been significant improvement in the quality of the clay dolls that were produced. The dolls were obviously more attractive because of a glossy texture and a varied number of options to choose from. Primers help in making the colouring more durable.

Use of mould

The artisans make their own moulds out of Plaster of Paris in cases of bulk orders. This helps the artisans in making the exact same product and also speeds up the process of doll making.

Social media and digital marketing

Social media has helped the artisans to advertise their products much more efficiently which eventually helps in better sale of their products. They also have easy access to contemporary and new designs through the internet.

Use of alternative raw materials

Sometimes when the correct consistency of clay is not achieved, it becomes very difficult to mould the dolls and they often develop cracks. So to overcome this challenge, the artisans have succumbed to other alternative raw materials like fibre, marble, stone dust and bronze. The cost of production in case of fibre and stone dust is much lower than that of clay while in case of marble and bronze the durability id much higher.

ABSTRACT

As local wellsprings of medications, remedial plants are used from the out of date events. Long pepper is one of the significantly used potential restorative plants on the planet. This plant is usually used for the treatment of standard chilly, free insides, fever as a result of a couple of infective explanation, jaundice, as a prosperity tonic for the liver and cardiovascular prosperity, and as a malignancy anticipation operator. It is furthermore used to improve sexual dysfunctions and fill in as a prophylactic. All bits of this plant are used to isolate the dynamic phytochemicals, yet the structures of phyto constituents by and large fluctuate beginning with one area then onto the following and with spot, season, and time of gather. We are using this property of Long pepper to get some new meds for Yellow Leaf Curl. The jobs of various pesticides, added substances, etc change the sustenances into poison. Other than the responses of these pesticides and added substances, etc are hazardous as considering the way that it prompts initiation of different dangerous development. In this whole world, the amount of patients passing on from threatening development is extending in a bargaining way. In-silico examination has done using programming and we further centered around a part of the characteristics at risk for Yellow Leaf Curl and pharmacophores from Long pepper and decimated some silico assessment. In this we have found that these two pharmacophores are having better Mol Doc score from any others. From this we can find that these two pharmacophores can be a response for pesticides in not all that removed future.

Keywords: Yellow Leaf Curl, Docking, *In Silico* Analysis, Pharmacophore, Long pepper.

INTRODUCTION

Long pepper was furthermore a generally adored in spiced wines and digestives. Half-fix, half-inebriant, spiced alcoholic cordials have been around since the Romans, the most renowned and enduring of which seems to have been the medieval 'hippocras', a red or white wine, instilled with mix of flavors and improved with sugar or nectar. In any case, in spite of the way that the Greek pro Hippocrates was various things, he was not the fashioner of vinum hippocraticum. Or on the other hand possibly, the authentic foundation of this particular beverage was gotten from the condition of the tightened channel through which the spiced wine was focused on, alluded to vintners as a manicum Hippocraticum – Hippocrates' sleeve. In spite of the way that creation procedures changed all through the many years, the name, and man's fulfillment in it, stuck, and references to hippocras can be found well into the eighteenth century.

Piperine has been seemed to overhaul the bio-availability of fundamentally and remedially contrasting medications, maybe by adjusting film components, as a result of its straightforward distributing extending vulnerability. The effect of Trikatu', a compound Ayurvedic availability containing Piper longum as one of the huge fixings, was attempted in mix with various meds. The examination uncovered that Trikatu' extended their profile availability either by propelling speedy digestion from the gastrointestinal tract or by protecting the medicine from being used during its first section through the liver in the wake of being expended, or by mix of the two instruments.

Studies have been done to affirm the ordinary instances of Ayurveda for antiasthmatic development of Piper longum. A concentrate of the natural items in milk decreased idle cutaneous excessive touchiness in rodents and made sure about guinea pigs against antigen-started bronchospasm. Piperine was evaluated and found to apply significant protection from tertiary butyl hydroperoxide and carbon tetrachlorideinduced hepatotoxicity, by diminishing both in vitro and in vivo lipid peroxidation. A characteristic item remove was reviewed in rodents for its hepatoprotective action against CCL,induced exceptional, incessant and reversible mischief and steady irreversible damage, using morphological, biochemical and histopathological assessment parameters. The concentrate improves the recuperation technique by keeping fibrosis, yet offered no protection from exceptional mischief or against cirrhotic changes.

Bound piperine exhibited a central energizer action in frogs, mice, rodents and dogs and extended the rest actuating response in mice. It irritated respiratory trouble impelled by morphine or pentobarbitone in anesthetized dogs and an oil ether concentrate of the normal items distanced morphine-instigated respiratory sorrow in mice, A comparative report coordinated with piperine and nalorphine, for impacts against morphine-provoked respiratory demoralization and absense of agony, found that both exchanged respiratory hopelessness regardless, rather than nalorphine, piperine didn't compromise morphine-activated absense of torment in rodents.

MATERIAL AND METHODS

Phytochemicals of Long pepper have been listed with their structure data files which are taken from pubchem ChEBI. Genes has been taken randomly for Yellow Leaf Curl using NCBI database. Table 1 has been showing the enlisted pharmacophores and the targeted genes. The PDB numbers of gene are taken from RCSB. The In-silico analysis has been done using BIOVIA –Discovery studio. We have performed various docking and used the Ramachandran plot and others.

Protein identification and preparation

The announced atomic targets liable for Yellow Leaf Curl are taken (Table 1) and the X-beam crystallographic structures of these objective proteins were recovered from protein information bank (PDB). The recovered PDB structures contain water particles, substantial iotas, cofactors, metal particles and so forth and these structures don't have data about topologies, bond requests and formal nuclear charges. Thus the downloaded PDB structures were readied utilizing 'plan protein' convention of Discovery Studio 4.0. The objective proteins were set up by evacuating

all water particles, ligands and other hetero molecules from the structures. Hydrogen iotas were added to the particles to fulfill their valencies. The structures were then vitality limited by applying CHARM power field to evacuate the steric conflicts between the molecules so as to get steady adaptation.

Active site identification

The binding sites of the receptor proteins were predicted based on 'receptor cavity method' using Accelry's Discovery Studio 4.0. Using this protocol, active sites of the target receptor were identified based upon the inhibitory property of the amino acid residues present in the binding sites.

Ligand preparation and filtration

An arrangement of 4 phyto mixes from Long pepper was taken as ligands for docking assessment. The 3D structures of these mixes were downloaded from PubChem database. These ligands were then tidied up, chose 3D supports and made ligand modifications by applying 'plan ligand appear' of Discovery Studio 4.0. After readiness, the mixes were disconnected dependent on the atomic properties for anticipating their dissolvability and helplessness in quiet exposure. The most standard of the physical property channels is Lipinski's "rule-offive", which spins around bioavailability. The standard conveys that the mixes have atomic mass under 500 daltons, not in excess of 5 hydrogen security advocates, not in excess of 10 hydrogen security acceptors and an octanol-water area coefficient log P not more obvious than 5 (Lipinski et al.,2001). The separated mixes were then utilized for docking evaluation.

Docking

The antimicrobial activity of all the 4 phytochemicals definite from Long pepper was assessed by docking these blends against the specific powerful districts of the goal proteins. Divulgence studio 4.0 was used in this assessment to find the teaming up blends of Long pepper with the picked focal points of Yellow Leaf Curl . Strategies of Discovery Studio 4.0 are to completely dock or score potential spots of each ligand in the coupling site of the proteins. Docking examination of the target proteins was done with regular blends got from Long pepper to find the supported course and limiting attachment to the blends in with each target protein using scoring limits. A sub-nuclear components (MD) imitated toughening based computation, explicitly, CDOCKER was used to score the partner blends. This methodology uses a gridbased depiction of the protein-ligand potential associations with figure the coupling affection (Wu et al., 2003). CDOCKER uses sensitive focus prospects, which are viewed as fruitful in the age of a couple of unpredictable adjustments of little organics and macromolecules inside the dynamic site of the goal protein. Ligands were docked to the proteins followed by scoring them for their general nature of collaboration to recognize opportunities for sedate progression. The last positions were then scored subject to the supreme docking imperativeness, which is made out of intramolecular essentialness of ligand and the ligand-protein affiliation. The most negligible essentialness structure was taken as the best fit. Comprehension of the characteristics was done using measures gave by Discovery Studio, for instance, CDOCKER imperativeness, CDOCKER joint effort essentialness, hydrogen bonds, confining imperativeness, etc.

Drug likeliness

Medication resemblance is a subjective idea utilized in sedate structure to assess how the substance demonstrations like medication regarding factors like bioavailability. The atomic properties which impact assimilation, conveyance, digestion, discharge and harmfulness are perceived as a long side remedial intensity as key determinants of whether a particle can be effectively evolved as a medication (Zhang et al., 2012). These parameters are answerable for around 60 percent disappointments of all medications in the clinical stages thus the expectation of ADMET properties assumes a noteworthy job in new medication disclosure process (Hire et al., 2012). In this manner, it has gotten basic to configuration lead mixes which would be effectively Breast ly ingested, handily moved to their focused on hand of activity, not effortlessly changed over into poisonous metabolic items and effortlessly dispensed with from the body before amassing in adequate sums. The ADMET properties of the mixes were investigated for medicate like up-and-comers.

RESULT AND DISCUSSION

Protein preparation and active site identification

The three dimensional structures of the identified target proteins were retrieved from the protein data bank. PDB ID of the targeted protein structure are mentioned in Table 1.

Ramachandran Plot of the targeted gene

The Ramachandran plot is among the most focal ideas in auxiliary science, found in distributions and course readings the same. Be that as it may, with the expanding quantities of known proteinstructures and more noteworthy precision of ultra-high goals protein structures, we are as yet getting familiar with the essential standards of protein structure. The utilization of torsion edges to portray polypeptide and protein adaptation was created by Sasisekharan as a major aspect of his investigations of the structure of collagen chains during his work as an alumni understudy in the exploration gathering of G.N. Ramachandran. The intensity of this methodology was promptly clear and its utilization immediately got broad. Utilizing updated definitions, this alleged Ramachandran plot or φ, ψ-plot has remained almost unaltered in the resulting fifty years and keeps on being a necessary instrument for protein structure research and instruction.

Hydrophobicity Plot of the Genes

Protein–protein interactions (protein functionalities) are mediated by water, which compacts individual proteins and promotes close and temporarily stable large-area protein–protein interfaces. In their classic article, Kyte and Doolittle (KD) concluded that the "simplicity and graphic nature of hydrophobicity scales make them very useful tools for the evaluation of protein structures." In practice, however, attempts to develop hydrophobicity scales (for example, compatible with classical force fields (CFF) in calculating the energetics of protein folding) have encountered many difficulties.

Ligand preparation

4 of the pharmacophores are fulfilled Lipinski rule and are relied upon to be dynamic mixes after Breast organization. The ligand particles with least restricting vitality are considered as mixes with most noteworthy restricting liking. This coupling proclivity showed an engaged collaboration between the above mixes with the objectives contrasted with others. The parameters for finding the best inhibitors, for example, CDOCKER vitality, CDOCKER cooperation vitality and number of hydrogen bonds were additionally assessed. CDOCKER vitality is the joined vitality delivered by the entirety of inward ligand strain vitality and receptor-ligand collaboration vitality where, CDOCKER cooperation vitality is the association vitality between the protein and ligand and the estimations of these two parameters show the quality of communication between the proteins and the ligands. Other than least restricting vitality, mixes with least nuclear vitality distinction between CDOCKER vitality and CDOCKER collaboration vitality were dissected. In view of CDOCKER vitality and CDOCKER collaboration vitality, Fig 4 is indicating the outcome ADMET Analysis:

Considering the comparable CDOCKER energy, interaction energy and binding energy, three compounds were forwarded for ADMET analysis. These studies are based on the ADMET(Absorption, Distribution, Metabolism, Excretion and Toxicity) properties of the compounds. These properties provide insights in to the pharmacokinetic properties of the compounds and were checked using Discovery Studio's built in ADMET protocol. The various parameters tested in this study were aqueous solubility, Blood Brain Barrier (BBB) level, Hepatotoxicity, Absorption level, AlogP and CYPD26. Pharmacokinetic properties of the best fit phytochemicals showed that two of the compounds had passed all the pharamacokinetic parameters. The compounds that passed the parameters were N-methyltyramine and dalbergioidin. These compounds were thus selected as the best compounds in this study as they had good interaction scores along with ADMET properties.

CONCLUSION

The apparent pharmacophores can be bound from the Long pepper and can be progressed as the ordinary solution for the Yellow Leaf Curl which is having lesser awful sign from the chemotherapeutic medication open in the market. This medication will in like way be incredibly progressively reasonable from the accessible drugs and these prescriptions are additionally not ruinous for the average cells as they are gotten from the common things.

The stand-apart fragment of the assessment is to focused quality treatment for biopesticides. This will assist our future medication with being totally identified with the Pharmachophores and the organizations of created and threatening development causing medication will reduce.

ABSTRACT

As native wellsprings of meds, therapeutic plants are utilized from the antiquated occasions. Long pepper is one of the profoundly utilized potential therapeutic plants on the planet. This plant is customarily utilized for the treatment of regular cold, loose bowels, fever because of a few infective reason, jaundice, as a wellbeing tonic for the liver and cardiovascular wellbeing, and as a cancer prevention agent. It is additionally used to improve sexual dysfunctions and fill in as a prophylactic. All pieces of this plant are utilized to separate the dynamic phytochemicals, yet the structures of phyto constituents generally vary starting with one section then onto the next and with spot, season, and time of collect. We are utilizing this property of Long pepper to get some new medications for Black gram and green gram. The employments of different pesticides, additives, and so forth transform the nourishments into poison. Besides the reactions of these pesticides and additives, and so forth are perilous as in light of the fact that it prompts commencement of various malignant growth. In this entire world, the quantity of patients passing on from malignant growth is expanding in a compromising manner. In-silico investigation has done utilizing programming and we further focused on a portion of the qualities liable for Choleraand pharmacophores from Long pepper and destroyed some silico examination. In this we have discovered that these two pharmacophores are having better Mol Doc score from any others. From this we can find that these two pharmacophores can be an answer for pesticides in not so distant future

Keywords: Cholera, Docking, *In Silico* Analysis, Pharmacophore, Long pepper

INTRODUCTION

Long pepper was additionally a most loved in spiced wines and digestives. Half-cure, half-inebriant, spiced alcoholic cordials have been around since the Romans, the most famous and suffering of which appears to have been the medieval 'hippocras', a red or white wine, imbued with blend of flavors and improved with sugar or nectar. However, despite the fact that the Greek specialist Hippocrates was numerous things, he was not the designer of vinum hippocraticum. Or maybe, the historical background of this specific drink was gotten from the state of the tapered channel through which the spiced wine was stressed, referred to vintners as a manicum Hippocraticum – Hippocrates' sleeve. Despite the fact that creation techniques changed throughout the hundreds of years, the name, and man's satisfaction in it, stuck, and references to hippocras can be discovered well into the eighteenth century.

Piperine has been appeared to upgrade the bio-accessibility of basically and restoratively differing drugs, perhaps by balancing film elements, because of its simple parceling and expanding penetrability. The impact of Trikatu', a compound Ayurvedic readiness containing Piper longum as one of the significant fixings, was tried in blend with different medications. The investigation revealed that Trikatu' expanded their profile accessibility either by advancing quick assimilation from the gastrointestinal tract or by shielding the medication from being utilized during its first entry through the liver in the wake of being consumed, or by blend of the two instruments.

Studies have been done to approve the conventional cases of Ayurveda for antiasthmatic movement of Piper longum. A concentrate of the organic products in milk diminished latent cutaneous hypersensitivity in rodents and secured guinea pigs against antigen-initiated bronchospasm. Piperine was assessed and found to apply noteworthy security against tertiary butyl hydroperoxide and carbon tetrachlorideinduced hepatotoxicity, by decreasing both in vitro and in vivo lipid peroxidation. A natural product extricate was surveyed in rodents for its hepatoprotective activity against CCL,induced intense, ceaseless and reversible harm and constant irreversible harm, utilizing morphological, biochemical and histopathological evaluation parameters. The concentrate improves the recovery procedure by confining fibrosis, yet offered no security against intense harm or against cirrhotic changes.

Confined piperine demonstrated a focal energizer activity in frogs, mice, rodents and hounds and expanded the sleep inducing reaction in mice. It offended respiratory sadness instigated by morphine or pentobarbitone in anesthetized hounds and an oil ether concentrate of the natural products alienated morphine-incited respiratory despondency in mice, A similar report directed with piperine and nalorphine, for impacts against morphine-prompted respiratory discouragement and absense of pain, found that both switched respiratory misery in any case, in contrast to nalorphine, piperine didn't threaten morphine-actuated absense of pain in rodents.

MATERIAL AND METHODS

Phytochemicals of Long pepper have been listed with their structure data files which are taken from pubchem ChEBI. Genes has been taken randomly for Cholerausing NCBI database. Table 1 has been showing the enlisted pharmacophores and the targeted genes. The PDB numbers of gene are taken from RCSB. The In-silico analysis has been done using BIOVIA –Discovery studio. We have performed various docking and used the Ramachandran plot and others

Protein identification and preparation

The announced atomic targets liable for Choleraare taken (Table 1) and the X-beam crystallographic structures of these objective proteins were recovered from protein information bank (PDB). The recovered PDB structures contain water particles, substantial iotas, cofactors, metal particles and so forth and these structures don't have data about topologies, bond requests and formal nuclear charges. Thus the downloaded PDB structures were readied utilizing 'plan protein' convention of Discovery Studio 4.0. The objective proteins were set up by evacuating all water particles, ligands and other hetero molecules from the structures. Hydrogen iotas were added to the particles to

fulfill their valencies. The structures were then vitality limited by applying CHARM power field to evacuate the steric conflicts between the molecules so as to get steady adaptation.

Active site identification

The binding sites of the receptor proteins were predicted based on 'receptor cavity method' using Accelry's Discovery Studio 4.0. Using this protocol, active sites of the target receptor were identified based upon the inhibitory property of the amino acid residues present in the binding sites.

Ligand preparation and filtration

An arrangement of 4 phyto mixes from Long pepper was taken as ligands for docking assessment. The 3D structures of these mixes were downloaded from PubChem database. These ligands were then tidied up, chose 3D supports and made ligand modifications by applying 'plan ligand appear' of Discovery Studio 4.0. After readiness, the mixes were disconnected dependent on the atomic properties for anticipating their dissolvability and helplessness in quiet exposure. The most standard of the physical property channels is Lipinski's "rule-offive", which spins around bioavailability. The standard conveys that the mixes have atomic mass under 500 daltons, not in excess of 5 hydrogen security advocates, not in excess of 10 hydrogen security acceptors and an octanol-water area coefficient log P not more obvious than 5 (Lipinski et al.,2001). The separated mixes were then utilized for docking evaluation.

Docking

The antimicrobial activity of all the 4 phytochemicals definite from Long pepper was assessed by docking these blends against the specific powerful districts of the goal proteins. Divulgence studio 4.0 was used in this assessment to find the teaming up blends of Long pepper with the picked focal points of cholera. Strategies of Discovery Studio 4.0 are to completely dock or score potential spots of each ligand in the coupling site of the proteins. Docking examination of the target proteins was done with regular blends got from Long pepper to find the supported course and limiting attachment to the blends in with each target protein using scoring limits. A sub-nuclear components (MD) imitated toughening based computation, explicitly, CDOCKER was used to score the partner blends. This methodology uses a gridbased depiction of the protein-ligand potential associations with figure the coupling affection (Wu et al., 2003). CDOCKER uses sensitive focus prospects, which are viewed as fruitful in the age of a couple of unpredictable adjustments of little organics and macromolecules inside the dynamic site of the goal protein. Ligands were docked to the proteins followed by scoring them for their general nature of collaboration to recognize opportunities for sedate progression. The last positions were then scored subject to the supreme docking imperativeness, which is made out of intramolecular essentialness of ligand and the ligand-protein affiliation. The most negligible essentialness structure was taken as the best fit. Comprehension of the characteristics was done using measures gave by Discovery Studio, for instance, CDOCKER imperativeness, CDOCKER joint effort essentialness, hydrogen bonds, confining imperativeness, etc.

Drug likeliness

Medication resemblance is a subjective idea utilized in sedate structure to assess how the substance demonstrations like medication regarding factors like bioavailability. The atomic properties which impact assimilation, conveyance, digestion, discharge and harmfulness are perceived as a long side remedial intensity as key determinants of whether a particle can be effectively evolved as a medication (Zhang et al., 2012). These parameters are answerable for around 60 percent disappointments of all medications in the clinical stages thus the expectation of ADMET properties assumes a noteworthy job in new medication disclosure process (Hire et al., 2012). In this manner, it has gotten basic to configuration lead mixes which would be effectively Breast ly ingested, handily moved to their focused on hand of activity, not effortlessly changed over into poisonous metabolic items and effortlessly dispensed with from the body before amassing in adequate sums. The ADMET properties of the mixes were investigated for medicate like up-and-comers.

RESULT AND DISCUSSION

Protein preparation and active site identification

The three dimensional structures of the identified target proteins were retrieved from the protein data bank. PDB ID of the targeted protein structure are mentioned in Table 1.

Ramachandran Plot of the targeted gene

The Ramachandran plot is among the most focal ideas in auxiliary science, found in distributions and course readings the same. Be that as it may, with the expanding quantities of known proteinstructures and more noteworthy precision of ultra-high goals protein structures, we are as yet getting familiar with the essential standards of protein structure. The utilization of torsion edges to portray polypeptide and protein adaptation was created by Sasisekharan as a major aspect of his investigations of the structure of collagen chains during his work as an alumni understudy in the exploration gathering of G.N. Ramachandran. The intensity of this methodology was promptly clear and its utilization immediately got broad. Utilizing updated definitions, this alleged Ramachandran plot or φ, ψ-plot has remained almost unaltered in the resulting fifty years and keeps on being a necessary instrument for protein structure research and instruction **Hydrophobicity Plot of the Genes:**

Protein–protein interactions (protein functionalities) are mediated by water, which compacts individual proteins and promotes close and temporarily stable large-area protein–protein interfaces. In their classic article, Kyte and Doolittle (KD) concluded that the "simplicity and graphic nature of hydrophobicity scales make them very useful tools for the evaluation of protein structures." In practice, however, attempts to develop hydrophobicity scales (for example, compatible with classical force fields (CFF) in calculating the energetics of protein folding) have encountered many difficulties.

Ligand preparation

4 of the pharmacophores are fulfilled Lipinski rule and are relied upon to be dynamic mixes after Breast organization. The ligand particles with least restricting vitality are considered as mixes with most noteworthy restricting liking. This coupling proclivity showed an engaged collaboration between the above mixes with the objectives contrasted with others. The parameters for finding the best inhibitors, for example, CDOCKER vitality, CDOCKER cooperation vitality and number of hydrogen bonds were additionally assessed. CDOCKER vitality is the joined vitality delivered by the entirety of inward ligand strain vitality and receptor-ligand collaboration vitality where, CDOCKER cooperation vitality is the association vitality between the protein and ligand and the estimations of these two parameters show the quality of communication between the proteins and the ligands. Other than least restricting vitality, mixes with least nuclear vitality distinction between CDOCKER vitality and CDOCKER collaboration vitality were dissected. In view of CDOCKER vitality and CDOCKER collaboration vitality, Fig 4 is indicating the outcome.

ADMET Analysis

Considering the comparable CDOCKER energy, interaction energy and binding energy, three compounds were forwarded for ADMET analysis. These studies are based on the ADMET(Absorption, Distribution, Metabolism, Excretion and Toxicity) properties of the compounds. These properties provide insights in to the pharmacokinetic properties of the compounds and were checked using Discovery Studio's built in ADMET protocol. The various parameters tested in this study were aqueous solubility, Blood Brain Barrier (BBB) level, Hepatotoxicity, Absorption level, AlogP and CYPD26. Pharmacokinetic properties of the best fit phytochemicals showed that two of the compounds had passed all the pharamacokinetic parameters. The compounds that passed the parameters were N-methyltyramine and dalbergioidin. These compounds were thus selected as the best compounds in this study as they had good interaction scores along with ADMET properties.

CONCLUSION

The perceived pharmacophores can be bound from the Long pepper and can be advanced as the normal prescription for the Cholera which is having lesser terrible manifestation from the chemotherapeutic drug open in the market. This medicine will in like manner be amazingly more affordable from the available meds and these meds are also not destructive for the run of the mill cells as they are gotten from the ordinary things.

The stand-out segment of the examination is to centered quality treatment for biopesticides. This will help our future medicine with being completely related to the Pharmachophores and the businesses of produced and malignant growth causing drug will diminish.

INTRODUCTION

Rosemary (*Rosmarinus officinalis*) is a woody enduring flavor plant and restorative plant local to the Mediterranean bowl and developed in pasty soil. We get sweet-smelling oil from stems, leaves and blossoms of rosemary. it's generally utilized as a food additive and sauce. R. officinalis L. is comprised of bioactive particles, the phytocompounds, liable for actualize a few pharmacological exercises, as antitumor, cancer prevention agent, mitigating, antimicrobial, antiproliferative, and defensive, constricting and inhibitory exercises. The utilization of rosemary separate as a characteristic cancer prevention agent was first revealed in 1955.

Rosemary includes a rich history, holding a unique situation among herbs for the imagery associated with it. In Europe rosemary includes an extremely old notoriety for improving memory, and has been utilized as a logo of fellowship, reliability and for recognition during weddings, war celebrations and memorial services (Moss, 2003). In old Greece, understudies would put rosemary branches in their hair to upgrade memory and fixation when reading for assessment (Calucci et al., 2003). Rosemary leaves are singed as an incense, fumigant and disinfectant, in times past, the herb was scorched in wiped out chambers to cleanse the air and was put in law courts as an insurance from prison fever (typhus), and through the Plague of 1665, and rosemary was conveyed and sniffed in dubious territories to ensure against plague. Strengthening those germ-free uses, a blend of rosemary and juniper was singed during war II in French medical clinics to eliminate germs (Usher, 1974; Phillips and Foy, 1990). In old China, rosemary was utilized for cerebral pains, a sleeping disorder, and mental exhaustion and topically for hairlessness (Leung and Foster, 1996). In India, rosemary appreciates a past filled with use as an energizer and as a carminative to remove gas from the stomach and digestive organs and as antimigraine (Nadkarni, 1994). The Egyptians utilized the plant for incense in custom purifying and mending. Anthropologists and archeologists have discovered proof that rosemary herbs were utilized as restorative, culinary and beautifying agents temperances inside the old Egypt, Mesopotamia, China and India (Stefanovits-Banyai et al., 2003) eliminate germs (Usher, 1974; Phillips and Foy, 1990). This medicinalR. officinalis plant is comparing to certain phytochemicals, for example, caffeic corrosive, carnosic corrosive, chlorogenic corrosive, monomeric corrosive, oleanolic corrosive, rosmarinic corrosive, rosmaquinones An and B , alpha-pinene , rosmanol , carnosol, ursolic corrosive, secohinokio, camphor, eucalyptol, rosmadial, and subsidiaries of eugenol and luteolin. The impacts showed by this plant incorporate (1) avoidance of issues related with atherosclerosis; (2) anticancer and antiproliferative impacts; (3) antiulcer activity ; (4) myocardial indispensable sign decrease with rosmarinic corrosive ; (5) cell reinforcement and calming activities of rosmarinic corrosive; (6) lipid peroxidation decrease in heart and cerebrum; (7) antiangiogenic and neuroprotective impacts of carnosic corrosive and carnosol; (8)ability to constrict asthma, atherosclerosis, waterfall, torment , hepatotoxicity, peptic ulceration , incendiary ailments, ischemic coronary illness; (9) control of hypercholesterolemia and oxidative pressure and help of physical and mental weakness; (10) antiviral; and antimicrobial activities ; (11) glycemia decrease , nephroprotective and radioprotective-antimutagenic limits; (12) hepatoprotective; (13) capacity to treat burdensome conduct; (14) relaxant and treatment for cutaneous sensitivity.

MATERIAL AND METHODS

Phytochemicals of Rosemary have been listed with their structure data files which are taken from pubchem ChEBI. Genes has been taken randomly for Nephritisusing NCBI database. Table 1 has been showing the enlisted pharmacophores and the targeted genes. The PDB numbers of gene are taken from RCSB. The In-silico analysis has been done using BIOVIA –Discovery studio. We have performed various docking and used the Ramachandran plot and others.

Protein identification and preparation

The announced atomic targets liable for Nephritisare taken (Table 1) and the X-beam crystallographic structures of these objective proteins were recovered from protein information bank (PDB). The recovered PDB structures contain water particles, substantial iotas, cofactors, metal particles and so forth and these structures don't have data about topologies, bond requests and formal nuclear charges. Thus the downloaded PDB structures were readied utilizing 'plan protein' convention of Discovery Studio 4.0. The objective proteins were set up by evacuating all water particles, ligands and other hetero molecules from the structures. Hydrogen iotas were added to the particles to fulfill their valencies. The structures were then vitality limited by applying CHARM power field to evacuate the steric conflicts between the molecules so as to get steady adaptation.

Active site identification

The binding sites of the receptor proteins were predicted based on 'receptor cavity method' using Accelry's Discovery Studio 4.0. Using this protocol, active sites of the target receptor were identified based upon the inhibitory property of the amino acid residues present in the binding sites.

Ligand preparation and filtration

An arrangement of 4 phyto blends from Rosemary was taken as ligands for docking examination. The 3D structures of these blends were downloaded from PubChem database. These ligands were then cleaned up, decided 3D encourages and made ligand adjustments by applying 'plan ligand show' of Discovery Studio 4.0. After preparation, the blends were isolated reliant on the nuclear properties for predicting their dissolvability and vulnerability in sedate divulgence. The most mainstream of the physical property channels is Lipinski's "rule-offive", which revolves around bioavailability. The standard communicates that the blends have nuclear mass under 500 daltons, not more than 5 hydrogen security advocates, not more than 10 hydrogen security acceptors and an octanol-water section coefficient log P not more unmistakable than 5 (Lipinski et al.,2001). The filtered blends were then used for docking assessment.

Docking

The antimicrobial action of all the 4 phytochemicals detailed from Rosemary was evaluated by docking these mixes against the particular dynamic locales of the objective proteins. Disclosure studio 4.0 was utilized in this examination to discover the collaborating mixes of Rosemary with the chose focuses of joint pain. Techniques of Discovery Studio 4.0 are to thoroughly dock or score potential places of every ligand in the coupling site of the proteins. Docking investigation of the objective proteins was finished with common mixes got from Rosemary to locate the favored direction and restricting fondness of the mixes with each target protein utilizing scoring capacities. A sub-atomic elements (MD) reproduced toughening based calculation, specifically, CDOCKER was utilized to score the associating mixes. This strategy utilizes a gridbased portrayal of the protein-ligand potential connections to figure the coupling fondness (Wu et al., 2003). CDOCKER utilizes delicate center possibilities, which are seen as successful in the age of a few irregular adaptations of little organics and macromolecules inside the dynamic site of the objective protein. Ligands were docked to the proteins followed by scoring them for their overall quality of cooperation to distinguish possibility for tranquilize advancement. The last stances were then scored dependent on the absolute docking vitality, which is made out of intramolecular vitality of ligand and the ligand-protein association. The most minimal vitality structure was taken as the best fit. Understanding of the qualities was finished utilizing measures gave by Discovery Studio, for example, CDOCKER vitality, CDOCKER collaboration vitality, hydrogen bonds, restricting vitality and so on.

Drug likeliness

Drug-likeness is a qualitative concept used in drug design to evaluate how the substance acts like drug with respect to factors like bioavailability. The molecular properties which influence absorption, distribution, metabolism, excretion and toxicity are recognized as a long side therapeutic potency as key determinants of whether a molecule can be successfully developed as a drug (Zhang et al., 2012). These parameters are responsible for about 60 percent failures of all drugs in the clinical phases and so the prediction of ADMET properties plays a significant role in new drug discovery process (Hire et al., 2012). Thus, it has become imperative to design lead compounds which would be easily Breast ly absorbed, easily transported to their targeted site of action, not easily converted into toxic metabolic products and easily eliminated from the body before accumulating in sufficient amounts. The ADMET properties of the compounds were analyzed for drug like candidates.

RESULT AND DISCUSSION

Protein preparation and active site identification

The three dimensional structures of the identified target proteins were retrieved from the protein data bank. PDB ID of the targeted protein structure are mentioned in Table 1.

Ramachandran Plot of the targeted gene

The Ramachandran plot is among the most focal ideas in auxiliary science, found in distributions and course readings the same. Be that as it may, with the expanding quantities of known proteinstructures and more noteworthy precision of ultra-high goals protein structures, we are as yet getting familiar with the essential standards of protein structure. The utilization of torsion edges to portray polypeptide and protein adaptation was created by Sasisekharan as a major aspect of his investigations of the structure of collagen chains during his work as an alumni understudy in the exploration gathering of G.N. Ramachandran. The intensity of this methodology was promptly clear and its utilization immediately got broad. Utilizing updated definitions, this alleged Ramachandran plot or φ, ψ-plot has remained almost unaltered in the resulting fifty years and keeps on being a necessary instrument for protein structure research and instruction.

Hydrophobicity Plot of the Genes

Protein–protein interactions (protein functionalities) are mediated by water, which compacts individual proteins and promotes close and temporarily stable large-area protein–protein interfaces. In their classic article, Kyte and Doolittle (KD) concluded that the “simplicity and graphic nature of hydrophobicity scales make them very useful tools for the evaluation of protein structures.” In practice, however, attempts to develop hydrophobicity scales (for example, compatible with classical force fields (CFF) in calculating the energetics of protein folding) have encountered many difficulties.

Ligand preparation

4 of the pharmacophores are fulfilled Lipinski rule and are relied upon to be dynamic mixes after Breast organization. The ligand particles with least restricting vitality are considered as mixes with most noteworthy restricting liking. This coupling proclivity showed an engaged collaboration between the above mixes with the objectives contrasted with others. The parameters for finding the best inhibitors, for example, CDOCKER vitality, CDOCKER cooperation vitality and number of hydrogen bonds were additionally assessed. CDOCKER vitality is the joined vitality delivered by the entirety of inward ligand strain vitality and receptor-ligand collaboration vitality where, CDOCKER cooperation vitality is the association vitality between the protein and ligand and the estimations of these two parameters show the quality of communication between the proteins and the ligands. Other than least restricting vitality, mixes with least nuclear vitality distinction between CDOCKER vitality and CDOCKER

collaboration vitality were dissected. In view of CDOCKER vitality and CDOCKER collaboration vitality, Fig 4 is indicating the outcome.

Ligand preparation

4 of the pharmacophores are fulfilled Lipinski rule and are relied upon to be dynamic mixes after Breast organization. The ligand particles with least restricting vitality are considered as mixes with most noteworthy restricting liking. This coupling proclivity showed an engaged collaboration between the above mixes with the objectives contrasted with others. The parameters for finding the best inhibitors, for example, CDOCKER vitality, CDOCKER cooperation vitality and number of hydrogen bonds were additionally assessed. CDOCKER vitality is the joined vitality delivered by the entirety of inward ligand strain vitality and receptor-ligand collaboration vitality where, CDOCKER cooperation vitality is the association vitality between the protein and ligand and the estimations of these two parameters show the quality of communication between the proteins and the ligands. Other than least restricting vitality, mixes with least nuclear vitality distinction between CDOCKER vitality and CDOCKER collaboration vitality were dissected. In view of CDOCKER vitality and CDOCKER collaboration vitality, Fig 4 is indicating the outcome.

ADMET Analysis

Considering the comparable CDOCKER energy, interaction energy and binding energy, three compounds were forwarded for ADMET analysis. These studies are based on the ADMET(Absorption, Distribution, Metabolism, Excretion and Toxicity) properties of the compounds. These properties provide insights in to the pharmacokinetic properties of the compounds and were checked using Discovery Studio's built in ADMET protocol. The various parameters tested in this study were aqueous solubility, Blood Brain Barrier (BBB) level, Hepatotoxicity, Absorption level, AlogP and CYPD26. Pharmacokinetic properties of the best fit phytochemicals showed that two of the compounds had passed all the pharamacokinetic parameters. The compounds that passed the parameters were N-methyltyramine and dalbergioidin. These compounds were thus selected as the best compounds in this study as they had good interaction scores along with ADMET properties.

CONCLUSION

The recognized pharmacophores can be confined from the Rosemary and can be popularized as the common medication for the Nephritis which is having lesser hurtful symptom from the chemotherapeutic medication accessible in the market. This medication will likewise be extremely less expensive from the accessible medications and these medications are additionally not hurtful for the typical cells as they are gotten from the normal items. The one of a kind component of the investigation is to focus quality treatment for targeted drug. This will assist our future medication with being totally associated to the Pharmachophores and the employments of manufactured and cancer-causing medication will decrease.

ABSTRACT

As native wellsprings of drugs, restorative plants are utilized from the antiquated occasions. Rosemary is one of the exceptionally utilized potential therapeutic plants on the planet. This plant is generally utilized for the treatment of basic cold, loose bowels, fever because of a few infective reason, jaundice, as a wellbeing tonic for the liver and cardiovascular wellbeing, and as a cancer prevention agent. It is additionally used to improve sexual dysfunctions and fill in as a prophylactic. All pieces of this plant are utilized to separate the dynamic phytochemicals, however the arrangements of phytoconstituents generally vary starting with one section then onto the next and with spot, season, and time of gather. We are utilizing this property of Rosemary to get some new medications for Black gram and green gram. The employments of different pesticides, additives, and so on transform the nourishments into poison. Also the symptoms of these pesticides and additives, and so on are perilous as in light of the fact that it prompts commencement of various malignant growth. In this entire world, the quantity of patients biting the dust from malignancy is expanding in a compromising manner. In-silico investigation has done utilizing programming and we further focused on a portion of the qualities liable for Black gram and green gram and pharmacophores from Rosemary and destroyed some silico examination. In this we have discovered that these two pharmacophores are having better Mol Doc score from any others. From this we can reason that these two pharmacophores can be an answer for pesticides in not so distant future.

Keywords: black gram and green gram, docking, *in silico* analysis, pharmacophore, rosemary

INTRODUCTION

Rosemary (*Rosmarinus officinalis*) is a woody perennial spice plant and medicinal plant native to the Mediterranean basin and grown in chalky soil. We get aromatic oil from stems, leaves and flowers of rosemary. it's commonly used as a food preservative and condiment. R. officinalis L. is made up of bioactive molecules, the phytocompounds, responsible for implement several pharmacological activities, like antitumor, antioxidant, anti-inflammatory, antimicrobial, antiproliferative, and protective, attenuating and inhibitory activities. theutilization of rosemary extract as a natural antioxidant was first reported in 1955. Rosemary features a rich history, holding a special position among herbs for the symbolism connected with it. In Europe rosemary features a very old reputation for improving memory, and has been used as a logo of friendship, loyalty and for remembrance during weddings, war commemorations and funerals (Moss, 2003). In ancient Greece, students would place rosemary sprigs in their hair to enhance memory and concentration when studying for examination (Calucci et al., 2003). Rosemary leaves are burnt as an incense, fumigant and disinfectant, in times past, the herb was burned in sick chambers to purify the air and was placed in law courts as a protection from jail fever (typhus), and through the Plague of 1665, and rosemary was carried and sniffed in suspicious areas to protect against plague. Reinforcing those antiseptic uses, a mix of rosemary and juniper was burned during war II in French hospitals to kill germs (Usher, 1974; Phillips and Foy, 1990). In ancient China, rosemary was used for headaches, insomnia, and mental fatigue and topically for baldness (Leung and Foster, 1996). In India, rosemary enjoys a history of use as a stimulant and as a carminative to expel gas from the stomach and intestines and as antimigraine (Nadkarni, 1994). The Egyptians used the plant for incense in ritual cleansing and healing. Anthropologists and archaeologists have found evidence that rosemary herbs were used as medicinal, culinary and cosmetics virtues within the ancient Egypt, Mesopotamia, China and India (Stefanovits-Banyai et al., 2003) kill germs (Usher, 1974; Phillips and Foy, 1990). This medicinal *R. officinalis* plant is corresponding to some phytochemicals such as caffeic acid, carnosic acid, chlorogenic acid, monomeric acid, oleanolic acid, rosmarinic acid, rosmaquinones A and B , alpha-pinene , rosmanol , carnosol, ursolic acid, secohinokio, camphor, eucalyptol, rosmadial, and derivatives of eugenol and luteolin. The effects demonstrated by this plant include (1) prevention of problems associated with atherosclerosis; (2) anticancer and antiproliferative effects; (3) antiulcer action ; (4) myocardial vital sign reduction with rosmarinic acid ; (5) antioxidant and anti-inflammatory actions of rosmarinic acid; (6) lipid peroxidation reduction in heart and brain; (7) antiangiogenic and neuroprotective effects of carnosic acid and carnosol; (8)ability to attenuate asthma, atherosclerosis, cataract, pain , hepatotoxicity, peptic ulceration , inflammatory diseases, ischemic heart disease; (9) control of hypercholesterolemia and oxidative stress and relief of physical and mental fatigue; (10) antiviral; and antimicrobial actions ; (11) glycemia reduction , nephroprotective and radioprotective-antimutagenic capacities; (12) hepatoprotective; (13) ability to treat depressive behaviour; (14) relaxant and treatment for cutaneous allergy.

MATERIAL AND METHODS

Phytochemicals of Rosemary have been listed with their structure data files which are taken from pubchem ChEBI. Genes has been taken randomly for Black gram and green gram using NCBI database. Table 1 has been showing the enlisted pharmacophores and the targeted genes. The PDB numbers of gene are taken from RCSB. The In-silico analysis has been done using BIOVIA –Discovery studio. We have performed various docking and used the Ramachandran plot and others.

Protein identification and preparation

The reported molecular targets responsible for Black gram and green gram are taken (Table 1) and the X-ray crystallographic structures of these target proteins were retrieved from protein data bank (PDB). The retrieved PDB structures contain water molecules, heavy atoms, cofactors, metal ions etc. and these structures do not have information about topologies, bond orders and formal atomic charges. Hence the downloaded PDB structures were

prepared using 'prepare protein' protocol of Discovery Studio 4.0. The target proteins were prepared by removing all water molecules, ligands and other hetero atoms from the structures. Hydrogen atoms were added to the atoms to satisfy their valencies. The structures were then energy minimized by applying CHARM force field to remove the steric clashes between the atoms in order to get stable conformation.

Active site identification

The binding sites of the receptor proteins were predicted based on 'receptor cavity method' using Accelry's Discovery Studio 4.0. Using this protocol, active sites of the target receptor were identified based upon the inhibitory property of the amino acid residues present in the binding sites.

Ligand preparation and filtration

An assortment of 4 phyto mixes from Rosemary was taken as ligands for docking investigation. The 3D structures of these mixes were downloaded from PubChem database. These ligands were then tidied up, determined 3D facilitates and created ligand adaptations by applying 'plan ligand convention' of Discovery Studio 4.0. After readiness, the mixes were separated dependent on the atomic properties for foreseeing their dissolvability and penetrability in medicate disclosure. The most popular of the physical property channels is Lipinski's "rule-offive", which centers around bioavailability. The standard expresses that the mixes have atomic mass under 500 daltons, not in excess of 5 hydrogen bond benefactors, not in excess of 10 hydrogen bond acceptors and an octanol-water segment coefficient log P not more prominent than 5 (Lipinski et al.,2001). The sifted mixes were then utilized for docking examination.

Docking

The antimicrobial action of all the 4 phytochemicals detailed from Rosemary was evaluated by docking these mixes against the particular dynamic locales of the objective proteins. Disclosure studio 4.0 was utilized in this examination to discover the collaborating mixes of Rosemary with the chose focuses of joint pain. Techniques of Discovery Studio 4.0 are to thoroughly dock or score potential places of every ligand in the coupling site of the proteins. Docking investigation of the objective proteins was finished with common mixes got from Rosemary to locate the favored direction and restricting fondness of the mixes with each target protein utilizing scoring capacities. A sub-atomic elements (MD) reproduced toughening based calculation, specifically, CDOCKER was utilized to score the associating mixes. This strategy utilizes a gridbased portrayal of the protein-ligand potential connections to figure the coupling fondness (Wu et al., 2003). CDOCKER utilizes delicate center possibilities, which are seen as successful in the age of a few irregular adaptations of little organics and macromolecules inside the dynamic site of the objective protein. Ligands were docked to the proteins followed by scoring them for their overall quality of cooperation to distinguish possibility for tranquilize advancement. The last stances were then scored dependent on the absolute docking vitality, which is made out of intramolecular vitality of ligand and the ligand-protein association. The most minimal vitality structure was taken as the best fit. Understanding of the qualities was finished utilizing measures gave by Discovery Studio, for example, CDOCKER vitality, CDOCKER collaboration vitality, hydrogen bonds, restricting vitality and so on.

Drug likeliness

Drug-likeness is a qualitative concept used in drug design to evaluate how the substance acts like drug with respect to factors like bioavailability. The molecular properties which influence absorption, distribution, metabolism, excretion and toxicity are recognized as a long side therapeutic potency as key determinants of whether a molecule can be successfully developed as a drug (Zhang et al., 2012). These parameters are responsible for about 60 percent failures of all drugs in the clinical phases and so the prediction of ADMET properties plays a significant role in new drug discovery process (Hire et al., 2012). Thus, it has become imperative to design lead compounds which would be easily Breast ly absorbed, easily transported to their targeted site of action, not easily converted into toxic metabolic products and easily eliminated from the body before accumulating in sufficient amounts. The ADMET properties of the compounds were analyzed for drug like candidates.

RESULT AND DISCUSSION

Protein preparation and active site identification

The three dimensional structures of the identified target proteins were retrieved from the protein data bank. PDB ID of the targeted protein structure are mentioned in Table 1.

Ramachandran Plot of the targeted gene

The Ramachandran plot is among the most central concepts in structural biology, seen in publications and textbooks alike. However, with the increasing numbers of known proteinstructures and greater accuracy of ultra-high resolution protein structures, we are still learning more about the basic principles of protein structure. The use of torsion angles to describe polypeptide and protein conformation was developed by Sasisekharan as part of his studies of the structure of collagen chains during his work as a graduate student in the research group of G.N. Ramachandran. The power of this approach was readily apparent and its use quickly became widespread. Using revised definitions, this so-called Ramachandran plot or φ, ψ-plot has remained nearly unchanged in the ensuing fifty years and continues to be an integral tool for protein structure research and education.

Hydrophobicity Plot of the Genes:

Protein–protein interactions (protein functionalities) are mediated by water, which compacts individual proteins and promotes close and temporarily stable large-area protein–protein interfaces. In their classic article, Kyte and Doolittle (KD) concluded that the "simplicity and graphic nature of hydrophobicity scales make them very useful tools for the evaluation of protein structures." In practice, however, attempts to develop hydrophobicity scales (for example, compatible with classical force fields (CFF) in calculating the energetics of protein folding) have encountered many difficulties.

Ligand preparation

4 of the pharmacophores are fulfilled Lipinski rule and are relied upon to be dynamic mixes after Breast organization. The ligand particles with least restricting vitality are considered as mixes with most noteworthy restricting liking. This coupling proclivity showed an engaged collaboration between the above mixes with the objectives contrasted with others. The parameters for finding the best inhibitors, for example, CDOCKER vitality, CDOCKER cooperation vitality and number of hydrogen bonds were additionally assessed. CDOCKER vitality is the joined vitality delivered by the entirety of inward ligand strain vitality and receptor-ligand collaboration vitality where, CDOCKER cooperation vitality is the association vitality between the protein and ligand and the estimations of these two parameters show the quality of communication between the proteins and the ligands. Other than least restricting vitality, mixes with least nuclear vitality distinction between CDOCKER vitality and CDOCKER collaboration vitality were dissected. In view of CDOCKER vitality and CDOCKER collaboration vitality, Fig 4 is indicating the outcome.

ADMET Analysis:

Considering the comparable CDOCKER energy, interaction energy and binding energy, three compounds were forwarded for ADMET analysis. These studies are based on the ADMET(Absorption, Distribution, Metabolism, Excretion and Toxicity) properties of the compounds. These properties provide insights in to the pharmacokinetic properties of the compounds and were checked using Discovery Studio's built in ADMET protocol. The various parameters tested in this study were aqueous solubility, Blood Brain Barrier (BBB) level, Hepatotoxicity, Absorption level, AlogP and CYPD26. Pharmacokinetic properties of the best fit phytochemicals showed that two of the compounds had passed all the pharamacokinetic parameters. The compounds that passed the parameters were N-methyltyramine and dalbergioidin. These compounds were thus selected as the best compounds in this study as they had good interaction scores along with ADMET properties.

CONCLUSION

The recognized pharmacophores can be confined from the Rosemary and can be popularized as the common medication for the Black gram and green gram which is having lesser hurtful symptom from the chemotherapeutic medication accessible in the market. This medication will likewise be extremely less expensive from the accessible medications and these medications are additionally not hurtful for the typical cells as they are gotten from the normal items.

The one of a kind component of the investigation is to focused quality treatment for biopesticides. This will assist our future medication with being totally associated to the Pharmachophores and the employments of manufactured and cancer-causing medication will decrease.

ABSTRACT

As aboriginal sources of medications, medicinal plants are used from the ancient times. *Andrographis paniculata* is one of the highly used potential medicinal plants in the world. This plant is traditionally used for the treatment of common cold, diarrhoea, fever due to several infective cause, jaundice, as a health tonic for the liver and cardiovascular health, and as an antioxidant. It is also used to improve sexual dysfunctions and serve as a contraceptive. All parts of this plant are used to extract the active phytochemicals, but the compositions of phytoconstituents widely differ from one part to another and with place, season, and time of harvest. We are using this property of Green Chiretta to get some new drugs for Chocolate Spot. The uses of various pesticides, preservatives, etc. turn the foods into poison. Moreover the side effects of these pesticides and preservatives, etc. are dangerous as because it leads to initiation of different cancer. In this whole world, the number of patients dying from cancer is increasing in a very threatening way. In-silico analysis has done using software and we further targeted some of the genes responsible for Chocolate Spot and pharmacophores from Green Chiretta and did some in silico analysis. In this we have found that these two pharmacophores are having better Mol Doc score from any others. From this we can deduce that these two pharmacophores can be a solution to pesticides in near future

Keywords: green chiretta, docking, in silico analysis, chocolate spot, pharmacophore

INTRODUCTION

Andrographis paniculata (Burm. F) Nees, commonly known as the "king of bitters," is an herbaceous plant belonging to the *A.canthaceae* and is found throughout tropical and subtropical Asia, Southeast Asia, and India. In India, *A.paniculata* is known as "Kalmegh"; in China it is known as "Chuan-Xin-Lian"; in Thailand it is known as "Fah Tha Lai"; in Malaysia it is known as "Hempedu bumi"; in Japan it is known as "Senshinren"; and in Scandinavian countries it is known as "green chiretta" (Chaudhary et. al, 2010). Extracts of this plant and andrographolide exhibit pharmacological activities such as those that are immunostimulatory (Joy et.al, 1998, Chaudhary et. Al, 2010), antiviral (Burkill et.al,1966), and antibacterial (Kavishankar et.al, 2011). As major active constituent, andrographolide exhibits a broad range of biological activities, such as anti-inflammatory, antibacterial, antitumor, antidiabetic, antimalarial, and hepatoprotective (Hajiaghaee and Akhondzadeh, 2012) Because of the impressive variety of these biological activities, researchers propose obtaining various leads by structurally modifying andrographolide. In recent decades, numerous andrographolide derivatives have emerged and their pharmacological activities have also been evaluated. However, studies that have comprehensively summarized or analyzed *A. paniculata* and its derivatives have been minimal. Therefore, to contribute to the advanced trends of research on andrographolide, this paper provides thorough information regarding the pharmacological activities of *A. paniculata* and its major compound andrographolide. Andrographolide is a major bioactive phytoconstituent found in various parts of *A. paniculata*, but particularly in the leaves. The chemical name of andrographolide is 3α, 14, 15, 18-tetrahydroxy-5β,9βH, 10α-labda-8, 12-dien-16-oic acid γ-lactone, and its molecular formula and weight are C20H30O5 and 350.4 (C 68.54%, H 8.63%, and O 22.83%), respectively. The structure of andrographolide has been analyzed by using X-ray, 1H,13 C-NMR, and ESI-MS (Jarukamjorn and Nemoto 2008, Akbar 2011, Kabir et.al. 2014, Urbi et al. 2014, Duke 2017). Although andrographolide is not very soluble in water, it is soluble in acetone, chloroform, ether, and hot ethanol. Crystalline andrographolide was reported to be highly stable, over a period of three months (Kumar et.al 2008). Some scientists reported a simple and rapid method for isolating andrographolide from the leaf of *A. paniculata*. Andrographolide has been reported to have a wide range of biological activities, such as those that are anti-inflammatory (Rajagopal et.al 2003), antiallergic (Cheung et al. 2005), antiplatelet aggregation (Liet al.v2007, Harjotaruno et.al 2008), hepatoprotective (Zhou et.al 2006).

MATERIALS AND METHODS

Phytochemicals of Ashwagandha have been listed with their structure data files which are taken from pubchem ChEBI. Genes has been taken randomly for Chocolate Spot using NCBI database. Table 1 has been showing the enlisted pharmacophores and the targeted genes. The PDB numbers of enzymes are taken from RCSB. The In-silico analysis has been done using BIOVIA –Discovery studio. We have performed various docking and used the Ramachandan plot and others.

Protein identification and preparation

The reported molecular targets responsible for Chocolate Spot are taken (Table 1) and the X-ray crystallographic structures of these target proteins were retrieved from protein data bank (PDB). The retrieved PDB structures contain water molecules, heavy atoms, cofactors, metal ions etc. and these structures do not have information about topologies, bond orders and formal atomic charges. Hence the downloaded PDB structures were prepared using 'prepare protein' protocol of Discovery Studio 4.0. The target proteins were prepared by removing all water molecules, ligands and other hetero atoms from the structures. Hydrogen atoms were added to the atoms to satisfy their valencies. The structures were then energy minimized by applying CHARM force field to remove the steric clashes between the atoms in order to get stable conformation.

Active site identification

The binding sites of the receptor proteins were predicted based on 'receptor cavity method' using Accelry's Discovery Studio 4.0. Using this protocol, active sites of the target receptor were identified based upon the inhibitory property of the amino acid residues present in the binding sites.

Ligand preparation and filtration

A collection of 5 phytocompounds from Green Chiretta were taken as ligands for docking analysis. The 3D structures of these compounds were downloaded from PubChem database. These ligands were then cleaned up, calculated 3D coordinates and generated ligand conformations by applying 'prepare ligand protocol' of Discovery Studio 4.0. After preparation, the compounds were filtered based on the molecular properties for predicting their solubility and permeability in drug discovery. The best known of the physical property filters is Lipinski's "rule-offive", which focuses on bioavailability. The rule states that the compounds have molecular mass less than 500 daltons, not more than 5 hydrogen bond donors, not more than 10 hydrogen bond acceptors and an octanol-water partition coefficient log P not greater than 5 **(Lipinski et al.,2001).** The filtered compounds were then used for docking analysis.

Docking

The anti-inflammatory activity of all the 4 phytochemicals reported from Green Chiretta was assessed by docking these compounds against the respective active sites of the target proteins. Discovery studio 4.0 was used in this study to find the interacting compounds of Green Chiretta with the selected targets of arthritis. Strategies of Discovery Studio 4.0 are to exhaustively dock or score possible positions of each ligand in the binding site of the proteins. Docking study of the target proteins was done with natural compounds derived from Green Chiretta to find the preferred orientation and binding affinity of the compounds with each target protein using scoring functions. A molecular dynamics (MD) simulated-annealing-based algorithm, namely, CDOCKER was used to score the interacting compounds. This method uses a gridbased representation of the protein-ligand potential interactions to calculate the binding affinity **(Wu et al., 2003).** CDOCKER uses soft-core potentials, which are found to be effective in the generation of several random conformations of small organics and macromolecules inside the active site of the target protein. Ligands were docked to the proteins followed by scoring them for their relative strength of interaction to identify candidates for drug development. The final poses were then scored based on the total docking energy, which is composed of intramolecular energy of ligand and the ligand-protein interaction. The lowest energy structure was taken as the best fit. Interpretation of the values was done using standards provided by Discovery Studio such as CDOCKER energy, CDOCKER interaction energy, hydrogen bonds, binding energy etc.

Drug likeliness

Drug-likeness is a qualitative concept used in drug design to evaluate how the substance acts like drug with respect to factors like bioavailability. The molecular properties which influence absorption, distribution, metabolism, excretion and toxicity are recognized as a long side therapeutic potency as key determinants of whether a molecule can be successfully developed as a drug **(Zhang et al., 2012).** These parameters are responsible for about 60 percent failures of all drugs in the clinical phases and so the prediction of ADMET properties plays a significant role in new drug discovery process (**Hire et al., 2012)**. Thus, it has become imperative to design lead compounds which would be easily Breast ly absorbed, easily transported to their targeted site of action, not easily converted into toxic metabolic products and easily eliminated from the body before accumulating in sufficient amounts. The ADMET properties of the compounds were analyzed for drug like candidates.

RESULT AND DISCUSSION

Protein preparation and active site identification

The three dimensional structures of the identified target proteins were retrieved from the protein data bank. PDB ID of the targeted protein structure are mentioned in Table 1.

Ramachandran Plot of the targeted gene

The Ramachandran plot is among the most central concepts in structural biology, seen in publications and textbooks alike. However, with the increasing numbers of known proteinstructures and greater accuracy of ultra-high resolution protein structures, we are still learning more about the basic principles of protein structure. The use of torsion angles to describe polypeptide and protein conformation was developed by Sasisekharan as part of his studies of the structure of collagen chains during his work as a graduate student in the research group of G.N. Ramachandran. The power of this approach was readily apparent and its use quickly became widespread. Using revised definitions, this so-called Ramachandran plot or φ, ψ-plot has remained nearly unchanged in the ensuing fifty years and continues to be an integral tool for protein structure research and education.

Hydrophobicity Plot of the Genes:

Protein–protein interactions (protein functionalities) are mediated by water, which compacts individual proteins and promotes close and temporarily stable large-area protein–protein interfaces. In their classic article, Kyte and Doolittle (KD) concluded that the "simplicity and graphic nature of hydrophobicity scales make them very useful tools for the evaluation of protein structures." In practice, however, attempts to develop hydrophobicity scales (for example, compatible with classical force fields (CFF) in calculating the energetics of protein folding) have encountered many difficulties.

Ligand preparation

4 of the pharmacophores are satisfied Lipinski rule and are expected to be active compounds after Breast administration. The ligand molecules with least binding energy are considered as compounds with highest binding affinity. This binding affinity indicated a focused interaction between the above compounds with the targets compared to others. The parameters for finding the best inhibitors such as CDOCKER energy, CDOCKER interaction energy and number of hydrogen bonds were also evaluated. CDOCKER energy is the combined energy produced by the sum of internal ligand strain energy and receptor-ligand interaction energy where, CDOCKER interaction energy is the interaction energy between the protein and ligand and the values of these two parameters indicate the strength of interaction between the proteins and the ligands. Besides least binding energy, compounds with least atomic energy difference between CDOCKER energy and CDOCKER interaction energy were analyzed. Based on CDOCKER energy and CDOCKER interaction energy, Fig 4 is showing the result.

CONCLUSION

The identified pharmacophores can be isolated from the Green Chiretta and can be commercialized as the natural drug for the Chocolate Spot which is having lesser harmful side effect from the chemotherapeutic drug available in the market. This drug will also be very cheaper from the available drugs and these drugs are also not harmful for the normal cells as they are derived from the natural products. The unique feature of the study is to targeted gene therapy for biopesticides. This will help our future medicine to be completely allied to the Pharmachophores and the uses of synthetic and carcinogenic drug will reduce.

ABSTRACT

Coriander (*Coriandrum sativum L.)* being a yearly herb is most generally utilized for flavoring reason. Its plant seeds, leaves and roots are palatable, in spite of the fact that they have unmistakable flavors and uses .It is an exceptionally mainstream restorative plant that has a place with Apiaceae family. The herb has a light and new flavor. Coriander can be utilized as entire plant and can be handled as a result of its transitory nature of leaves and to build the satisfactoriness of ready organic products (seeds) before utilizing it as seasoning operator in various food arrangements. Entire plant of coriander predominantly new leaves and ready organic products are utilized for culinary purposes. Coriander leaves have unexpected preference for comparison to its seeds, with citrus hints. Coriander plant is a rich store of micronutrients and dietary components which drives us to concentrate our investigation on this herb. Coriander is exceptionally low in soaked fat in any case, contains great measure of linoleic corrosive which is a decent wellspring of α-tocopherol and nutrient K. Leaves of plant are rich wellspring of nutrients while seeds are rich in polyphenols and basic oils. Coriander taste is given to its fundamental oil including a huge substance of linoleic and furanocoumarins (coriandrine and dihydrocoriandrine). Coriander is additionally notable for its cancer prevention agent, against diabetic, hostile to mutagenic, antianxiety and antimicrobial movement alongside pain relieving and hormone adjusting impact that advances its utilization in nourishments because of various medical advantages and its defensive impact to safeguard the nourishment for longer period.

Keywords: antioxidant content, anti-diabetic Coriandrum sativum, fatty acids,

INTRODUCTION

Coriander (*Coriandrum sativum L.*) which has a place with the family Apiaceae (Umbelliferae) is for the most part developed from its seeds consistently (Mhemdi et al., 2011). India is the greatest maker, shopper and exporter of coriander on the planet with a yearly creation of around three lakh tons. It is a yearly, herbaceous plant which started from the Mediterranean and Middle Eastern areas and known as therapeutic plants. The fundamental oils and concentrates of fragrant plants and flavors have been utilized in food conservation, pharmaceuticals, elective medication and normal treatments. As of now, it is important to research those plants logically, for the piece of basic oil (EO) and its natural exercises, which have been utilized in conventional medication to improve the nature of human services (Bhatta *et,al.,* 1989). The EO substance in various species are fluctuated characteristically, affected enormously by culture conditions and condition, just as by harvest and post-crop preparing, and henceforth assessments of the oils from numerous restorative plants are being directed. One of the most helpful EO bearing flavors just as therapeutic plants is *Coriandrum sativum L. (C. sativum)* (containing EO in its leaves, stem, blossoms and natural products/seeds) (Cerkauskas 2009).

South Asia is the world's greatest maker of coriander and a looming exporter to the nations like the USA, Middle East, EU, and South East Asia. World creation of coriander natural product is precarious to evaluate, since legitimate measurements inconsistently control figures identifying with this yield. An extensive greatness of coriander is developed in harping gardens or for a humble scope, and isn't recorded in any measurements. Enthralling the various explanations on this topic into account, the overall creation of coriander might be assessed at roughly 550,000 ha for each annum (Chakravarti and Rangrajan 1966).

CHEMICAL CONSTITUENTS

It incorporates: Monoterpene hydrocarbons viz α-pinene, β-pinene, limonene, γ-terpinene, ϱ-lymene, borneolXmphoe, Geraniol and Geranylacetate; Heterocyclic mixes viz – pyrazine, pyridine, thiazole, furan, tetrahydrofuran subsidiaries; Isocoumacin viz coriandrin, dihyrocoriandrin, coriandrones An E, glazonoids; Phthalides viz - neochidilide, Z-digustilide; Phenolic acids and sterols, flavonoids (Wallis, 2005). Carotenoids are of pervasive event in all plants with higher fixations in regenerative organs. In green verdant vegetables, carotenoids, especially β-carotene is kept basically in leaves. Carotenoids can likewise be prepared and utilized as shading specialists just as great wellspring of cancer prevention agents. Other than different jobs, carotenoids predominantly work as foragers of the free radicals created by chlorophylls during photograph oxidation. Its leaves being acceptable wellspring of β-carotene fill in as an antecedent of nutrient A. In coriander, β-carotene content, 160 μg/100 g is available though all out carotenoid content is 1010 μg/100 g (Kandlakunta et al., 2008). Its foliage is utilized in different sorts of nourishments particularly in diets of individuals confronting nutrient A lack. Green foliage contains anthocyanin (Omidbaigi, 2005). Anthocyanins are bioactive flavonoid intensifies that keep body from different ceaseless sicknesses. Anthocyanin in foliage goes about as cancer prevention agents which are extremely helpful in progress of dietary benefit just as upkeep of wellbeing (Chupp 1953). A scope of aldehyde mixes are to a great extent liable for the fragrance of coriander leaves. The biggest extent of these is those aldehydes with 6-10 carbon molecules, especially decyl (10) and nonyl (9) aldehydes. Other significant constituents of the leaves are 2-decenoic corrosive, decanoic corrosive (otherwise called capric corrosive) and tetradecenoic corrosive (Champawat, and Singh 2009).

PHARMACOLOGICAL EFFECTS

Antidiabetic effect

Organization of coriander seeds (5g/day) to NIDDM patients for 60 days essentially diminished lipid peroxidation, protein oxidation, diminished action of erythrocyte catalase (CAT), expanded serum β carotene, nutrient An, E and C in NIDDM diabetics. The treatment was additionally expanded the action of erythrocyte cell reinforcement compound for example glutathione-S-transferase (GST) and decreased glutathione content (GSH) in the rewarded

diabetics. The hypoglycemic impact of *Coriandrum sativum* was concentrated clinically in patients with type-2 diabetes mellitus. In the wake of measuring fasting plasma and urinary glucose, 10 patients of type-2 diabetes mellitus with no past medicine, 10 patients of type-2 diabetes mellitus taking oral hypoglycemic specialists with history of deficient control and six control subjects were given low (2.5 g tid) and high (4.5 g tid) dosages of watery and alcoholic concentrates of *Coriandrum sativum* for 14 days. On fifteenth day, blood and pee tests were taken for glucose estimation. *Coriandrum sativum* has huge hypoglycemic action in high portion and can be effectively joined with oral hypoglycemic operators in type-2 diabetic patients whose diabetes was not constrained by oral hypoglycemic medication alone. The hypoglycemic action of methanolic concentrates of leaves of *Coriandrum sativum* was assessed in rodents. The methanolic remove demonstrated critical portion dependant reduction in blood glucose level at a portion of 200 and 400 mg/kg. It likewise diminished the lipid parameters, for example, complete cholesterol, LDL, HDL, VLDL and TG when contrasted and diabetic control. SGOT and SGPT were diminished portion conditionally. Coriander fused into the eating routine (62.5 g/kg) and drinking water (2.5 g/l, arranged by 15 min decoction) decreased hyperglycaemia of streptozotocin-diabetic mice. A watery concentrate of coriander (1 mg/ml) expanded 2-deoxyglucose transport (1.6-overlap), glucose oxidation (1.4-overlay) and joining of glucose into glycogen of segregated murine muscular strength (1.7-crease) tantamount with 10-8 M-insulin. In intense 20 min tests, 0.25-10 mg/ml fluid concentrate of coriander evoked a stepwise 1.3-5.7-crease incitement of insulin emission from a clonal B-cell line. This impact was annulled by 0.5 mM-diazoxide. The impact of concentrate was potentiated by 16.7 mM-glucose and 10 mM-L-alanine however not by 1 mM-3-isobutyl-1-methylxanthine. Insulin discharge by hyperpolarized B-cells (16.7 mM-glucose, 25 mM-KCl) was additionally upgraded by the nearness of concentrate. Movement of the concentrate was seen as warmth stable, CH3)2CO solvent and unaltered by overnight introduction to corrosive (0.1 M-HCl) or dialysis to expel parts with atomic mass<2000 Da. Movement was decreased by for the time being introduction to soluble base (0.1 M-NaOH). Consecutive extraction with solvents uncovered insulin-discharging action in hexane and water portions showing a potential combined impact of more than one concentrate constituent. *Coriandrum sativum* (CS) supplementation (1% and 3% w/w) to high fat eating routine (HFD) mice (for 12 weeks) altogether forestalled HFD incited increase in body weight gain, food consumption, feed effectiveness, fasting blood glucose, plasma insulin, fasting insulin opposition record (FIRI), plasma and hepatic triglyceride (TG), all out cholesterol (TC), plasma free unsaturated fat (FFA), adipocyte width and surface region alongside decrement in adipocyte number. These arrangement of changes were similar to the rosiglitazone (0.05%) enhanced HFD took care of mice. The ethanol concentrate of *Coriandrum sativum* seeds was examined for its impacts on insulin discharge from the pancreatic beta cells in streptozotocin-prompted diabetic rodents. Pancreatic areas of 5 microm were handled for assessment of insulin-discharging action utilizing an immune cytochemistry technique. The outcomes demonstrated that organization of the ethanol extricate (200 and 250 mg/kg, ip) showed a noteworthy decrease in serum glucose. Then again, organization of streptozotocin diminished the quantity of beta cells with insulin secretory action in examination with flawless rodents, yet treatment with the coriander seed separate (200 mg/kg) expanded altogether the action of the beta cells in correlation with the diabetic control rodents. The potential hypoglycemic action of *Coriandrum sativum* (CS)- separate was examined after a solitary oral portion and after every day dosing for 30 days (sub-ceaseless investigation) in typical and large hyperglycemic-hyperlipidemic (OHH) rodents. A solitary portion of CS-concentrate or GLB stifled hyperglycemia in OHH rodents, and normoglycemia was accomplished at 6h post portion; there was no impact on lipids, TG or insulin, yet insulin opposition (IR) diminished fundamentally. The hypoglycemic impact was lower in typical rodents. In the subchronic concentrate in OHH rodents, the impact of (CS-extract> glibenclamide) with respect to diminishing plasma glucose (causing normoglycemia on day 21), expanding insulin and diminishing IR, TC, LDL-cholesterol, and TG. Atherosclerotic file was diminished, while cardioprotective files were expanded by CS-separate, with no impact on body weight, urea or creatinine. The antihyperglycaemic properties of the watery concentrate from the leaves and stems of Coriandrum sativum were assessed in normoglycaemic rodents, and on α-glucosidase action from Saccharomyces cerevisiae. Rodents were managed with the fluid concentrate of the plant at 100, 300 and 500 mg/kg, to watch the impact on oral sucrose resilience test. The fluid concentrate displayed noteworthy antihyperglycaemic movement at the three tried dosages. In vitro explores different avenues regarding α-glucosidase showed a serious kind hindrance. The antidiabetic and cancer prevention agent impacts of *Coriandrum sativum* (CS) were concentrated in alloxan-actuated diabetic rodents. The concentrates of

CS in alloxan-instigated diabetic rodents were found to essentially bring down blood glucose levels. Antidiabetic action of the CS extricates was tantamount with the clinically accessible medication glibenclamide. The degrees of serum complete cholesterol, triglycerides, and low-thickness lipoprotein cholesterol were lower in the extracttreated gathering and high-thickness lipoprotein cholesterol was higher than the diabetic control rodents. The concentrates of CS displayed solid rummaging impact on 2, 2-diphenyl-2-picrylhydrazyl free radical and restrained lipid peroxidation. The free radical rummaging impact of the concentrates was similar with that of the reference cancer prevention agents. Moreover, it additionally indicated an improved cancer prevention agent potential as confirm by diminished lipid peroxidation and a huge increment in the movement of different cell reinforcement proteins, for example, catalase, superoxide dismutase, and glutathione peroxidase in the liver of diabetic rodents (Singh 1946).

Anticancer effect

Salt water shrimp lethality bioassay uncovered that coriander LC50 was 2.25 mg/ml. The anticancer exercises of *Coriandrum sativum* root, leaf and stem, just as its impact on malignant growth cell relocation, and its assurance against DNA harm, with unique spotlight on the roots was assessed. The ethyl acetic acid derivation concentrate of *Coriandrum sativum* roots demonstrated the most noteworthy anti-proliferative action on MCF-7 cells (IC50 = 200.0 ± 2.6 µg/ml), had the most elevated phenolic substance and FRAP and DPPH searching exercises among the concentrates. Ethyl acetic acid derivation concentrate of *Coriandrum sativum* root restrained DNA harm and forestalled MCF-7 cell relocation instigated by H2O2, recommending its potential in malignant growth counteraction and metastasis hindrance. The concentrate showed anticancer movement in MCF-7 cells by influencing cancer prevention agent proteins potentially prompting H2O2 gathering, cell cycle capture at the G2/M stage and apoptotic cell passing by the demise receptor and mitochondrial apoptotic pathways. The antitumor and immune modulating exercises of watery and methanol concentrates of *Coriandrum sativum* (leaf and seed) was examined in vitro. The fluid concentrate of *Coriandrum sativum* (leaf), caused huge ($P<0.05$) 24, 39 percent L5178Y-R lymphoma cells harmfulness at 31.2 µg/ml (MIC), though the methanol concentrate of Coriandrum sativum (seed and leaf) caused 40 and 31 percent cytotoxicity at 7.8, 62.5 µg/ml (MICs), espectively. Furthermore, *Coriandrum sativum* leaf watery concentrate invigorated noteworthy ($P<0.01$) 14 to 45 percent splenic cells lympho proliferation at 7.8 to 125 µg/ml separately. The methanol concentrates of *Coriandrum sativum* leaf extricate caused huge ($P<0.01$) 43 to 59 percent lympho proliferation at the tried focuses. Besides, *Coriandrum sativum* watery concentrates were altogether ($P<0.01$) decrease up to 100% nitric oxide creation by LPS-animated macrophages. Three distinctive cell lines BMK (kidney), KHOS-2405 (bone), and WRL-68 (liver) were utilized to decide cytotoxicity. Cells were treated with various *Coriandrum sativum* (Cilantro) fixations (0.125%, 0.25%, 0.5%, 1%, 1.5%, 2% and 2.5%), for 24 hours. After this time, cytotoxic examinations were performed. An embryotoxicity study was finished utilizing prolific chicken eggs (gallus) vaccinating with *Coriandrum sativum* focuses (0.125%, 0.25%, 0.5%, 1%, 1.5%, 2% and 2.5%); hatched for 48 hours and watch them utilizing an electronic magnifying instrument to check the impacts. The three lines demonstrated diminished multiplication and number of cells corresponding to the focuses. The cell cycle examination indicated that *Coriandrum sativum* captured the WRL-68 cells in the (S) stage; the BMK cells were captured in the G2 and M stage, and the KHOS cells in the G1 stage. *Coriandrum sativum* delivered significant morphologic consequences for chicken incipient organisms. The utilization of *Coriandrum sativum* produces toxicological impacts on the incipient organisms just in high portions.

Cardiovascular effects

Coriander unrefined concentrate (1-30 mg/ml) caused fall in blood vessel pulse of anesthetized creatures which incompletely obstructed by atropine. Coriander unrefined concentrate delivered vasodilatation against phenylephrine and K+ (80 mM)- incited withdrawals in hare aorta and caused cardio-depressant impact in guinea-pig atria. Bioassay directed fractionation uncovered the partition of spasmogenic and spasmolytic segments in the fluid and natural divisions separately. Moreover, Coriander rough concentrate created diuresis in rodents at 1-10mg/kg. Fluid concentrates of coriander seeds hindered the electrically-evoked constrictions of winding strips and

rounded sections of disconnected focal ear supply route of hare (Harsha and Anilakumar 2016). The water concentrate of coriander seed had hypotensive impacts in rodents. The preventive impact of *Coriandrum sativum* (CS) on heart harm was assessed by isoproterenol instigated cardiotoxicity model in male rodents. Rodents were pretreated with methanolic concentrate of CS seeds at a portion of 100, 200 or 300 mg/kg orally for 30 days and they were hence regulated (sc) with isoproterenol (85 mg/kg body weight) throughout the previous two days. Isoproterenol rewarded rodents indicated expanded LPO, diminished degrees of endogenous cancer prevention agents and ATPases in the cardiovascular tissue along with expanded plasma lipids and markers of heart harm. TTC recoloring demonstrated expanded infarct regions while HXE recoloring indicated myofibrillar hypertrophy and interruption. CS (200 and 300 mg/kg body weight) pretreatment altogether forestalled or opposed every one of these changes. The outcomes indicated that methanolic concentrate of CS can forestall myocardial dead tissue by hindering myofibrillar harm. It is likewise proposed that, the rich polyphenolic substance of CS remove was answerable for forestalling oxidative harm by adequately searching the isoproterenol created ROS (Shivanand 2016).

CONCLUSION

Herbs and flavors are prepared in nourishments from early occasions for flavoring just as to expand timeframe of realistic usability of food and to reestablish wellbeing. Coriander is one of wonderful herb that capacities as both, zest just as home grown medication. In spite of the fact that plant can be developed consistently, it is handled to build its acceptability, gainfulness and encourage worldwide exchange. The leaves and organic products are exceptionally fragrant and contain supplements like fat, proteins, nutrients minerals and so forth. Its medical advantages exercises going from antibacterial to anticancer exercises. Generally significant and all around portrayed property of coriander is its utilization as cancer prevention agent. Because of its multifunctional utilizes and defensive and preventive activity against different constant sicknesses, this herb is righty called as "herb of bliss". Additionally, preparing of foods grown from the ground of coriander is the most ideal approach to save this herb. As indicated by the wide scope of pharmacological exercises, *Coriandrum sativum* ought to be considered as a promising wellspring of numerous medications as a result of its security and adequacy.

ABSTRACT

Image processing is a method to perform some operations on an image, in order to get an enhanced image or to extract some useful information from it. It is a type of signal processing in which input is an image and output may be image or characteristics/features associated with that image. The purpose of image processing is to improve the quality of the image by removing the disturbances. It consists of various techniques such as Image segmentation, enhancement, classification, restoration, pattern recognition, extraction etc. Image classification plays an important part in the fields of Remote sensing, Image analysis, Pattern recognition and many more. Digital image classification is the process of sorting all the pixels in an image into a finite number of individual classes. Here we discuss how Amazon SageMaker can be used for classification of digital images.

Keywords: Amazon SageMaker, Image Classification, Image Processing

INTRODUCTION

Digital imaging is a process to recognize objects of interest in an image by utilizing electronic devices and advanced computing techniques with the aim to improve image quality parameters. It contains basic difficulties due to the fact that image formation is basically a many-to-one-mapping. There are several problems associated with low-contrast images, blurred images, noisy images, image conversion to digital form, transmission, handling, manipulation, and storage of large-volume images, led to the development of efficient image processing and recognition algorithms. Digital imaging or computer vision involves image processing and pattern recognition techniques. Image processing techniques deal with image enhancement, segmentation, classification, restoration, reconstruction, manipulation and analysis of images etc. Digital image consists of discrete picture elements called pixels which are associated with a digital number represented as DN that depicts the average radiance of relatively small area with a scene. The range of DN values is normally 0 to 255. Digital Imaging advantages include:

- Accurate data acquisition
- Better combination of spatial and contrast resolution
- No degradation with time or copying
- Compact storage/easy retrieval
- Data correction/manipulation/enhancement
- Fast accurate image transmission

Classification of digital images generally comprises four steps

- Pre-processing. e.g. atmospheric correction, noise suppression, and finding the band ratio, principal component analysis, etc,
- Training: Selection of the particular feature which best describes the pattern,
- Decision: Choice of suitable method for comparing the image patterns with the target patterns
- Assessing the accuracy of the classification. The informational data are classified into supervised and unsupervised systems.

Image classification refers to the task of extracting information classes from a multi brand raster image. The resulting raster from image classification can be used to create thematic maps. Depending on the interaction between the analyst and the computer during classification, there are two types of classification: supervised and unsupervised.

Supervised classification

Supervised classification uses the spectral signatures obtained from training samples to classify an image. With the assistance of the Image Classification toolbar, you can easily create training samples to represent the classes you want to extract. We can also easily create a signature file from the training samples, which is then used by the multivariate classification tools to classify the image. In supervised classification, we select representative samples for each land cover class. The software then uses these "training sites" and applies them to the entire image. Supervised classification uses the spectral signature defined in the training set. For example, it determines each class on what it resembles most in the training set. The common supervised classification algorithms are maximum likelihood and minimum-distance classification.

Supervised Classification Steps

a) Select training areas
b) Generate signature file
c) Classify

Unsupervised classification

Unsupervised classification finds spectral classes (or clusters) in a multiband image without the analyst's intervention. The Image Classification toolbar aids in unsupervised classification by providing access to the tools to create the clusters, capability to analyze the quality of the clusters, and access to classification tools. In unsupervised classification, it first groups pixels into "clusters" based on their properties.

Unsupervised Classification Steps

a.Generate clusters
b.Assign classes

CLASSIFY IMAGES USING AMAZON SAGEMAKER

Amazon SageMaker is a fully managed service that supports all of the steps of a ML model's development: data exploration and building, training, and deploying ML models. With Amazon SageMaker, you can pick and use any of the built-in algorithms, reducing the time to market and the development cost. Traditional ML development is a complex, expensive, iterative process made even harder because there are no integrated tools for the entire machine learning workflow. You need to stitch together tools and workflows, which is time-consuming and error-prone. SageMaker solves this challenge by providing all of the components used for machine learning in a single toolset so models get to production faster with much less effort and at lower cost.

The Amazon SageMaker image classification algorithm is a supervised learning algorithm that supports multi-label classification. It takes an image as input and outputs one or more labels assigned to that image. It uses a convolutional neural network that can be trained from scratch or trained using transfer learning when a large number of training images are not available. The recommended input format for the Amazon SageMaker image classification algorithms is Apache MXNet RecordIO. However, you can also use raw images in .jpg or .png format.

The state-of-the-art technologies for image classification and object detection are based on deep learning (DL). DL is a subarea of machine learning (ML) that is focused on algorithms for handling neural networks (NN) with many layers, or deep neural networks. ML, in turn, is a subarea of artificial intelligence (AI), a computer-science discipline.

Understanding transfer learning

Transfer learning is a technique used for reducing the time required for training a new model. Instead of training your model from scratch, you can use a modified pre-trained model and continue training it with your dataset. That's why it's called transfer learning: the knowledge learned by one NN is transferring to another NN. It means, for instance, that if you want a model that can classify cars brand/model/year and you already have a pre-trained model, it makes sense to change it a little bit and retrain it with your own dataset in order to create a new model that will solve this new problem. The Amazon SageMaker built-in algorithm for image classification is already prepared for transfer learning. You just need to set a given parameter to true, and your model will use this technique.

Set up the environment

Make sure that the Role attached to your Jupyter Notebook Instance has the privileges for accessing S3. That instance will read and write to chosen S3 bucket. Now it's time to select the hyper parameters of your training environment. These parameters will determine how your model will be trained and, consequently, how your trained model will behave.

- **Num_layers:** the number of hidden/inner layers of your network. For small images chose a lower number, like [20, 32, 44, 56, 11].
- **Image_shape:** number of channels per width and height pixels of the images. That is, 3,28,28 where 3 is the number of color channels (RGB) and 28,28 are the width and height pixels of the images.
- **Num_classes:** number of classes that the model can classify
- **Mini_batch_size:** the number of images each batch will contain. Depending on how much VRAM your GPU has you can increase or decrease this size. A large size can cause an out-of-memory exception and the training will fail.
- **Epochs:** how many times the training algorithm will pass through your whole dataset. Depending on the algorithm you chose, each epoch will get only a random sample of your dataset for each epoch.

- **Learning_rate:** how fast the training algorithm will try to optimize your model. Lower learning rates can achieve best accuracy will take more time to train your model. Higher learning rates can fail to improve your model accuracy. You need to find a good balance for this attribute.
- **Use_pretrained_model:** if set to 1 it will enable Transfer Learning. Amazon SageMaker will get a pretrained Resnet with Imagenet 11K categories and customize it to your scenario.

After setting all these hyper parameters, you can select your instance, preferably a P2 or P3 instance with powerful GPUs, and start training your model.

Training the model

Amazon SageMaker is a platform based on Docker containers. Every built-in algorithm is a Docker image prepared with all of the libraries, frameworks, and binaries along with the algorithm itself. It turns the platform as flexible as possible. If you want to design your own ML algorithm, using your preferable technology just create a Docker image with your algorithm and call it from Amazon SageMaker. In this case, we will use an image that already contains the algorithm we need. This image will be used for creating a job that will train our model and then to publish the trained model in production as an endpoint. Depending on the region your Amazon SageMaker environment is running in, you'll need to select a different registry:

- us-west-2:dkr.ecr.us-west-2.amazonaws.com/image-classification:latest
- us-east-1:dkr.ecr.us-east-1.amazonaws.com/image-classification:latest
- us-east-2:dkr.ecr.us-east-2.amazonaws.com/image-classification:latest
- eu-west-1:dkr.ecr.eu-west-1.amazonaws.com/image-classification:latest

Next, you have to create a job description. The job description is a structure with all the parameters and hyper parameters you have set that will be sent to Amazon SageMaker so that SageMaker can then start a job for you. The result of this process is the trained model that will be saved to the S3 bucket you chose. You can monitor each step of the training process through CloudWatch Logs and Metrics, as shown in the following image. Just click in the running job in the Amazon SageMaker console and go to the Monitor session. If you want to see how much GPU memory is being utilized or what is the GPU or CPU utilization, just go to Amazon CloudWatch metrics.

Testing and deploying the model

The following steps are needed:

- Convert the job output in a model that will be available in the Amazon SageMaker model catalog.
- Create an endpoint configuration. In this step, you decide which instance will support your predictions. It is possible to train your model in a machine with GPU and then deploy it on a CPU only machine. That's what we'll do in our hands on. Deploying your model to a CPU only instance can reduce your costs.
- Deploy your model, using the endpoint configuration defined previously. Amazon SageMaker will create an instance for you and deploy a container with the algorithm you've selected. Inside that container, your trained model will be hosted. After that, you will be able to send requests to that endpoint by using an API.

CONCLUSION

Amazon SageMaker helps you create a powerful solution for your image-classification needs. You can focus on the creation process and the business problem itself while Amazon SageMaker gives you a flexible and elastic infrastructure for supporting your ML pipeline.

ABSTRACT

The most common hazard in forests is forests fire. They pose a threat not only to the forest wealth but also to the entire regime to fauna and flora seriously disturbing the bio-diversity and the ecology and environment of a region. A forest fire is a disaster and threat not only to the forest but also to the wild animals, the entire ecology and to the environment. The early detection and monitoring of forest fire with accuracy leads to a boon to the wild life and the inhabitants because, as soon as the detection and monitoring is processed, the necessary and quick actions to that can be taken in time. Here we are discussing how AWS IoT Analytics can be used to analyze forest fire so that effective and in-time action can be taken in an optimized way

Keywords: AWS IoT Analytics, Forest fire

INTRODUCTION

Forest plays an important role in the balancing of environment, socio-ecological and recreational system. [3] In India the total forest and tree cover is 79.42 million hectare, which is 24.16 % of the total geographical area. Forests have high impact in balancing the equilibrium in atmospheric carbon absorption, regulation of temperature and rainfall, reduction of soil erosion etc. Forest fire also known as Wildfire is a severe disaster [4] which has negative effect on socio- ecological and economical balances. Every year thousands hectares of forest territory is ravaged due to this forest fire. In 2016 more than 4000 hectares of forest were destroyed in the hills of Uttarakhand due to various reasons of forest fire. In some cases forest fire leads to the death of the inhabitants at the affected zone. The main cause of forest fire may be natural like lightning, rolling of stones, and rubbing of dry bamboos due to strong winds or may be accidental fires created due to human carelessness. Forest fire is considered to be one of the causes of global warming. Forest fire detection methods mainly consist of patrolling, observation from watch towers, satellite monitoring or harbour watch system.

The conventional methods like patrolling, watchtowers are easy but not effective. The problems with these methods are carelessness of guards, absence from the post, inability for real-time monitoring and the limited area coverage

etc. The satellite based monitoring is a popular and most widely used method [4][10] but it requires a long scan cycle and till the completion, fire may have spread in an uncontrolled way. This method covers broad areas but resolution of images is low [5] and sometime clouds and fogs may mask the images which lead to distorted image broadcasting. Forest Watch [11] is another forest fire detection system. These systems are operational in different countries like South Africa (83 towers), USA (22 towers), Swaziland (5 towers), Canada (4 towers), Chile (20 towers), and Slovakia (4 towers). The Harbour Watch system has been deployed in South Africa and Namibia [12] as shown in fig. 1. In this approach fire is reliably detected up to a range of 20 km but sometime it generates false alarms. So here we proposed the use of wire- less sensor network as a real-time, energy efficient model in detecting forest fire.

AWS IOT ANALYTICS

AWS IoT Analytics is a fully-managed service that makes it easy to run and operationalize sophisticated analytics on massive volumes of IoT data without having to worry about the cost and complexity typically required to build an IoT analytics platform. It is the easiest way to run analytics on IoT data and get insights to make better and more accurate decisions for IoT applications and machine learning use cases. IoT data is highly unstructured which makes it difficult to analyze with traditional analytics and business intelligence tools that are designed to process structured data. IoT data comes from devices that often record fairly noisy processes (such as temperature, motion, or sound). The data from these devices can frequently have significant gaps, corrupted messages, and false readings that must be cleaned up before analysis can occur. Also, IoT data is often only meaningful in the context of additional, third party data inputs. For example, to help farmers determine when to water their crops, vineyard irrigation systems often enrich moisture sensor data with rainfall data from the vineyard, allowing for more efficient water usage while maximizing harvest yield. AWS IoT Analytics automates each of the difficult steps that are required to analyze data from IoT devices. AWS IoT Analytics filters, transforms, and enriches IoT data before storing it in a time-series data store for analysis. You can setup the service to collect only the data you need from your devices, apply mathematical transforms to process the data, and enrich the data with device-specific metadata such as device type and location before storing the processed data. Then, you can analyze your data by running ad hoc or scheduled queries using the built-in SQL query engine, or perform more complex analytics and machine learning inference. AWS IoT Analytics makes it easy to get started with machine learning by including pre-built models for common IoT use cases. You can also use your own custom analysis, packaged in a container, to execute on AWS IoT Analytics. AWS IoT Analytics automates the execution of your custom analyses created in Jupyter Notebook or your own tools (such as Matlab, Octave, etc.) to be executed on your schedule.

AWS IoT Analytics benefits

- Operationalize your analytical workflows
- Easily run queries on IoT data
- Data storage optimized for IoT
- Prepares your IoT data for analysis
- Tools for machine learning

Automated scaling with pay as you go pricing.

HOW AWS IOT ANALYTICS WORKS

a) Collect

- Integrated with AWS IoT Core—AWS IoT Analytics is fully integrated with AWS IoT Core so it can receive messages from connected devices as they stream in.
- Use a batch API to add data from any source—AWS IoT Analytics can receive data from any source through HTTP. That means that any device or service that is connected to the internet can send data to AWS IoT Analytics.
- Collect only the data you want to store and analyze—You can use the AWS IoT Analytics console to configure AWS IoT Analytics to receive messages from devices through MQTT topic filters in various

formats and frequencies. AWS IoT Analytics validates that the data is within specific parameters you define and creates channels. Then, the service routes the channels to appropriate pipelines for message processing, transformation, and enrichment.

b) Process

- Cleanse and filter—AWS IoT Analytics lets you define AWS Lambda functions that are triggered when AWS IoT Analytics detects missing data, so you can run code to estimate and fill gaps. You can also define maximum and minimum filters and percentile thresholds to remove outliers in your data.
- Transform—AWS IoT Analytics can transform messages using mathematical or conditional logic you define, so that you can perform common calculations like Celsius into Fahrenheit conversion.
- Enrich—AWS IoT Analytics can enrich data with external data sources such as a weather forecast, and then route the data to the AWS IoT Analytics data store.

c) Store

- Time-series data store—AWS IoT Analytics stores the device data in an optimized time-series data store for faster retrieval and analysis. You can also manage access permissions, implement data retention policies and export your data to external access points.
- Store processed and raw data—AWS IoT Analytics stores the processed data and also automatically stores the raw ingested data so you can process it at a later time.

d) Analyze

- Run Ad-hoc SQL queries—AWS IoT Analytics provides a SQL query engine so you can run ad-hoc queries and get results quickly. The service enables you to use standard SQL queries to extract data from the data store to answer questions like the average distance traveled for a fleet of connected vehicles or how many doors in a smart building are locked after 7pm. These queries can be re-used even if connected devices, fleet size, and analytic requirements change.
- Time-series analysis—AWS IoT Analytics supports time-series analysis so you can analyze the performance of devices over time and understand how and where they are being used, continuously monitor device data to predict maintenance issues, and monitor sensors to predict and react to environmental conditions.
- Hosted notebooks for sophisticated analytics and machine learning—AWS IoT Analytics includes support for hosted notebooks in Jupyter Notebook for statistical analysis and machine learning. The service includes a set of notebook templates that contain AWS-authored machine learning models and visualizations. You can use the templates to get started with IoT use cases related to device failure profiling, forecasting events such as low usage that might signal the customer will abandon the product, or segmenting devices by customer usage levels (for example heavy users, weekend users) or device health. After you author a notebook, you can containerize and execute it on a schedule that you specify.
- Prediction—You can do statistical classification through a method called logistic regression. You can also use Long-Short-Term Memory (LSTM), which is a powerful neural network technique for predicting the output or state of a process that varies over time. The pre-built notebook templates also support the K-means clustering algorithm for device segmentation, which clusters your devices into cohorts of like devices. These templates are typically used to profile device health and device state such as HVAC units in a chocolate factory or wear and tear of blades on a wind turbine. Again, these notebook templates can be contained and executed on a schedule.

e) Build and visualize

- Amazon QuickSight integration—AWS IoT Analytics provides a connector to Amazon QuickSight so that you can visualize your data sets in a QuickSight dashboard.
- Console integration—You can also visualize the results or your ad-hoc analysis in the embedded Jupyter Notebook in the AWS IoT Analytics' console.

CONCLUSION

AWS IoT Analytics automates the steps required to analyze data from IoT devices. AWS IoT Analytics filters, transforms, and enriches IoT data before storing it in a time-series data store for analysis. You can set up the service to collect only the data you need from your devices, apply mathematical transforms to process the data, and enrich the data with device-specific metadata such as device type and location before storing it. Then, you can analyze your data by running queries using the built-in SQL query engine, or perform more complex analytics and machine learning inference. AWS IoT Analytics enables advanced data exploration. So this can be used to analyze forest fire data so that a quick, effective and in-time action can be taken.

ABSTRACT

A flower shaped patch over the substrate is proposed in this article. This antenna act as a dipole antenna.It consists of a substrate, a radiator, a ground and a port. When we give signal to the wave port the antenna works. This proposed antenna main a compact structure. The simulated ones, giving a wide impedance bandwidth of 1.68 to 2.75 GHz, a high port-to-port insulation (better than 37 dB) within the operating frequency bandwidth, and a good radiation pattern. In fact, the suggested antenna retains a compact configuration of 0.78 λ_0 × 0.78 λ_0 0.18λ_0. This antenna is designed for 2G/3G / LTE base station as this antenna is built with a compact framework so.

Keywords: Flower shaped patch, dipole antenna, polarization, return loss, radiation pattern.

INTRODUCTION

The base station antennas with broad impedance array, high port insulation secure radiation pattern, low cross polarization and low profile are in great demand due to the rapid growth of electronic communication. Dual-polarized antenna shares which are widely used in base stations for mobile communication to improve system performance by using diversity of polarization. In base stations, it became common and contributes to their successful success in reducing multi-path fading and growing channel power[1-2].

This consists of two such broadband antenna elements positioned orthogonally to one another for dual polarization operation.Various dual-polarized antennas have recently been suggested as base station antennas with variable structures such as patch antenna dipole antenna, crossed-dipole antenna, crossed-slot antenna and multi-dipole antenna. A patch antenna is a type of low-profile radio antenna which can be placed on a flat surface. This consists of a thin rectangular sheet of metal, placed on a wider sheet of metal called a ground plane [3-4]. Patch antennas are common because the advantages of low profile, low cost and ease of mass manufacturing. The shorted patch antenna or planer antenna is a version of the patch antenna widely found in cell phones [8-9].

One corner of the patch is grounded in this antenna, with a ground plate. Thanks to their low weight, capacity to adapt to any geometrical structure, and simple incorporation and low-cost manufacturing, the patch antennas are very useful. Their main drawback is their narrow bandwidth, unfit for wireless communication [6]. This can give

performance in bandwidth, and it can also reconfigure frequency. This article opens with brief introduction of basic features, feeding method, and patch antenna analysis techniques.Also, an option for dual polarization is a cross-shaped slot antenna excited by two orthogonal staggered microstrip feed sheets. As well as the stepped microstrip feed lines, stepped impedance slot and small crossed slot were also used to suit impedance over a large bandwidth [10].To achieve dual polarization and a high 40 dB isolation covering a wide bandwidth, a multi-dipole antenna is introduced in. Yet due to its crown-shaped structure, its manufacturing may be difficult.

Antenna parameters

Parameters of antennas are

a) Gain
b) Radiation pattern
c) Bandwidth
d) Polarization
e) Impedance.

The antenna pattern is the antenna 's response from a given direction to a plane wave incident, or the relative power density of the wave which the antenna transmits in a given direction.

Radiation pattern of the antenna

A radiation pattern defines the power variation which an antenna radiates as a function of the direction away from the antenna. This strength variance is observed as a function of the angle of arrival in the far field of the antenna.

Types of Radiation pattern

- Power pattern: -Trace of angular variation of the power received from antenna at a constant radius.
- Amplitude field pattern: -Analysis of the spatial variance in electric field amplitude at a constant antenna radius.

Directivity

Directivity is an essential parameter of antennas. It is a measure of how 'directional' the radiation pattern in an antenna is. An antenna that radiates in both directions similarly would have zero directionality and 1 (or 0 dB) would be the direction of this type of antenna.

DIPOLE ANTENNA

In this a dipolar antenna is introduced. The antenna consists of a radiator, a cross-shaped slot coupler, a pair of baluns with microstrips and a reflector. The cross-shaped slot coupler will act as a four-way equal-split power divider while baluns are excited and produce four differential signals at four ends of the slot lines. The signals would then be coupled to four modified dipoles in order to radiate and synthesize linear polarization in the slant ±45 °. The design proposed is verified through the manufacture and testing of a prototype antenna. The signals would then be coupled to four modified dipoles in order to radiate and synthesize linear polarization in the slant ±45 °.

Types of Dipoleantenna

Half wave dipole antenna

The most widely used half-wave dipole antenna is the one. It is a resonant antenna, being a half wavelength long. The dipole half-wave antenna is just a special case of the dipole antenna, but it’s important enough to have its own section. Note that the term "half-wave" means that at the operating frequency, the length of this dipole antenna is equal to one half-wavelength.

Folded dipole antenna

Because the name means this type of the aerial dipole or dipole antenna is folded back on itself. Although the gap between the ends of half a wavelength is always retained, an extra conductor gap essentially links the two ends together.

Short dipole

A short dipole antenna is one that is much less in duration than half a wavelength. Where a dipole antenna is shorter than half a wavelength, the impedance to feed starts to increase, and its response is less dependent on frequency changes.

Non-resonant dipole

A dipole antenna with a high impedance feeder and operate away from its resonant frequency. That allows it to work across a much broader bandwidth.

Broadband dipole antenna-By through the amount it occupies an antenna may be rendered broadband. Thus, by increasing the dipole's radius, a dipole antenna can become more broadband. Such antennas are also classified as dipole wideband.

Antenna Parameters

There are many criteria to consider when choosing an antenna for a wireless system. Two of the most significant aspects to consider include how the interference differs in the various ways across the antenna, how effective the antenna is, the frequency that the antenna provides the best output and the antenna that suits optimum power transmission.

DESIGN of FLOWER SHAPED ANTENNA

A reconfigurable antenna based was simulated for frequency polarization. Application of Rogers RO4003C substrate with a 3.55 dielectric constant and a 32 mm width. The configured antenna dimension is as shown in figure: W=1.72 mm, L=48.7 mm, T=0.8 mm. Figure 1 shows the flower shaped patch design over the substrate using HFSS.

SIMULATION RESULT

The proposed antenna simulation parameter with different angles of rotation is shown in the diagram. The test indicates that the antenna 's operational frequency spectrum does not differ with the rotation angle shift. It can be shown that the effects of the calculation are compatible with the outcome of the simulation. Consequently, the antenna 's working frequency varies from 7.3 to 11.5GHz. Both measured and simulated parameters are less than -10dB throughout the entire band width.

The operating frequency of both RHCP and LHCP operating modes may therefore be replicated by changing the angle between the slot antenna, the MS and the metallic reflector. The bandwidth of estimated 3dB is 3.2GHz.

The calculated and simulated radiation trend and the potential antenna gains at 8.5GHz are shown in the figure for specific radiation angel. The antenna pattern measurements are done only around the main beam to get more accurate test results. It can be seen that for slot antenna the antenna has directional radiation patterns rather than bidirectional radiation pattern. It's obvious that by decreasing the size, the bore sight gain is increased. The maximum gain measured, at 10.5 GHz, is 15.5dBi.

Radiation Pattern

The findings of the microstrip dipole antenna were explored with respect to bandwidth, characteristic radiation pattern and cross-polar isolation relative to monopoly antenna.

The return loss simulation result of flower shaped dipoleantenna is shown in figure 2.

CONCLUSION

A low-cost dipole microstrip antenna has been proposed for WLAN operations in the 2.4GHzband. The antenna proposed is small in diameter, which is simple to install. The antenna radiates bidirectional in the E-plane by having its dipole near one half wavelengths. The prototype was the dipole, and was tested. Microstrip dipole bandwidth is 14.68 per cent higher than mono pole antenna. The microstrip dipole antenna's cross-polar insulation is within the range of 3 to 17.32 dB. The full cross-polar insulation can be seen at H Plane. The HPBW for dipole microstrip is 60º for E plane and 75º for H plane.

ABSTRACT

Plants, that occur naturally in plants are useful to them for defense against potential threats from infecting agents and predators. Turmeric (*Curcuma longa*) has gained attentionin worldwide prominence owing to their wide range of medicinal properties. The phytochemicals present in it, though are non-nutritive chemicals, but still have protective and disease preventive properties in them. Researches havealso demonstrated that these phytochemicals can also protect humans against several diseases. Giardiasis is caused by contamination due to *Giardia lamblia*. One of the key proteins, which is involved in its metabolic pathway is Giardia lamblia 15.5 kD RNA binding protein. The molecular docking of the phytochemicals present in *Curcumalonga* was evaluated with the proteinfrom*Giardia lamblia*using BIOVIA Discovery Studio. The strength of the interaction and efficacy was evaluated based on level of-CDocker energy and -CDocker interaction energy. Values that were skewed towards the positive side for both the-CDocker energy and -CDocker interaction energy represented an efficient and stable interaction between the phytochemical and the protein. It was identified that out of different phytochemicals that are present in *Curcuma longa*, Bisdemethoxycurcumin and benzene can efficiently deactivate *Giardia lamblia* 15.5 kD RNA binding protein thereby interrupting the life cycle of *Giardia lamblia*

Keywords: Phytochemical, BIOVIA, Discovery studio, *Curcuma longa,Giardia lamblia.*

INTRODUCTION

Phytochemicals are plant based natural chemical productswhich has several roles to play. Some of them can providecolors to the fruits, flowers, certain others can provide distinctive aroma to them, whereas, certain others are able to provide defense to the plant against potential threats. These phytochemicals can also provide health benefits to human beings on consumption. Phytochemicals, due to this property are often regarded as research

componentalong with the property of being anessential nutrient [1]. They have gained attention as their possible health effects has not yet clearly established.Phytochemists study phytochemicals by extractingthe compounds from the plant, followed by identifying their structure and testing in laboratory models, like cell cultures, *in vivo* studies using laboratory animals and in several*in vitro* experiments[2]. Challenges in the process occurswhile isolating specific compounds in order to determine their structures, for identificationof specific phytochemicals that are primarily responsible for their biological activity[3].Based on the health efficiency of phytochemicals, they arecategorized as essential nutrients, contained naturally in plant extracts. They help plants in acquiring their regular functionscoherently and have also been linked to reduction of several chronic diseases[4]. However, there are convincing evidences suggestingof even more health benefits associated with phytochemicals that still needs to be explored [5].

Curcuma longa, belonging to the family Zingiberaceae, is a rhizomatous herbaceous plant which is traditionally known as turmeric in India. It is popularly used as a spice in Indian cuisine. Awide range of biological properties are associated with this herb, such as, anticancer, antimicrobial,anti-inflammatory activities. It also finds use in free radical scavenging activity[6, 7].The vast diversity of *Curcuma*species is plentily available in India, Thailand and several of the tropical Asian countries. Recent studies have reported that the taxonomy of *Curcuma longa* majorly has specimens from South India[8]. Various other species that areused and sold as "turmeric" in parts of Asia belong to few of the physically similar taxas, with overlapping local names.Curcuma contains many active constituents in it, with overlapping biological activities, such as curcuminoids, vitamins, minerals, phytochemicals, cineole and other monoterpenes.

Giardia lamblia causes infection in humans as cysts which metamorphoses into a trophozoite, that can multiply by binary fission in the intestine of human and can cause diseases like diarrhea. It is an intestinal parasite infecting and causing severe intestinal disease worldwide. In the present study, the efficiency of *Curcuma longa* against the Giardia lamblia 15.5 kD protein was evaluated.

MATERIALS AND METHODS

Software used

Dassault Systemes BIOVIA Discovery studio module was used for carrying out the analysis. It uses CDOCKER, a CHARMm-based docking engine in order to perform flexible and efficient ligand-based docking and to provide docking refinement. Dassault Systemes BIOVIA Discovery studio module was used for carrying out the analysis. It uses CDOCKER, a CHARMm-based docking engine in order to perform flexible and efficient ligand-based docking and to provide docking refinement.

List of phytochemicals

Phytochemicals are the plant- based chemicals, that can stimulate the immune system. Several works have reported*Curcuma longa* to contain phytochemicals such asbenzene, chrysin, bisdemethoxycurcumin, coumarin,guaiazulene. The present study is focused on identifying particular phytochemicalsthat are responsible for inhibiting and controlling Giadiasis.

Protein found in Giardia lamblia

It has been reported that Giardia lamblia 15.5 kD RNA binding protein (protein database code 3O85) is engaged in some of the crucial activities that are required for the survival of this particular microorganism.

Molecular docking

Molecular docking techniquewas used to identify the phytochemicalsin *Curcuma longa*, that can covalently bind with the parasitic protein to successfully inhibit its activity. Dassault Systemes BIOVIA Discovery studio tool was employed for identifying molecular interactions between the phytochemicals and protein structure[9]. In the course

of the process, the sdf files for various phytochemicals that are reported in*Curcuma longa* plant were downloaded. The protein database code of *Giardia lamblia* 15.5 kD RNA binding protein was also identified. In odder to identify the active site of the protein, "receptor cavity" protocol underneaththe "receptor-ligand interaction" menu was selected. Molecular docking approachwas carried out using the CDocker entente of BIOVIA Discovery studiosoftware. In it,the "receptor-ligand interaction" resource was exploited to evaluate the interaction energy. The enzyme molecule was regarded as the receptor molecule and the phytochemicalwas regarded as the ligand molecule. The"-CDOCKER_ENERGY" and "-CDOCKER_INTERACTION_ENERGY" were the choice to estimate the quality of the docking. High positive scoreduring the docking studies werecriterion for good interaction between the small molecule or the ligand and the receptor. Thus, the interactions with high values were the index for screening the major phytochemical that are responsible for curing this disease.

RESULTS AND DISCUSSION

Figure 1 shows the active site of the protein*Giardia lamblia* 15.5 kD RNA binding protein. CDOCK is a molecular dynamics (MD) simulated-annealing-based algorithm, with CHARMm-based docking enginewhich isdeveloped for accuracy. The ligand conformations were obtained by Molecular Dynamic methods.

The estimation of -CDOCKER energy was established on the extent of internal ligand strain energy as well as receptor-ligand interaction energy. -CDOCKER interaction reveals the value of the nonbonded interaction existing between the protein and the phytochemical molecule.The most coherentamong all interactions was chosen based on the positive score of -CDOCKER energy and was also dependent on the minute difference between -CDOCKER energy and -CDOCKER interaction energy.Table 1 shows that *Giardia lamblia* 15.5 kD RNA binding protein interacts with bis-demethoxycurcumin and has the highest positive score of -CDOCKER energy i.e. 30.0939 and a minimum difference i.e. 6.1502 between - C DOCKER interaction energy and - C DOCKER energy followed by benzene, coumarin, chrysin. It was also observed that variance between the - C DOCKER interaction energy and - C DOCKER energy was minimum with Benzene i.e. 2.1069, signifying a stable interaction between the ligand and the receptor. Thus, the results indicated thatbisdemethoxucurcumin, chrysin,benzene, and coumarinhave the potentials to effectively deactivate the *Giardia lamblia* 15.5 kD RNA binding protein. Greater positive values for bisdemethoxycurcumin indicated that it could be the most active component against *Giardia lamblia*. Thus, as per the observations in the present study, the key phytochemicals preventing giardiasis caused by *Giardia lamblia* are bisdemethoxycurcumin and benzene.

CONCLUSION

As it known that *Curcuma longa* plant is an effective medicinal plant. However, its activity against giardiasis is caused by *giardia lamblia*was evaluated in the present study. The study was carried out to provide a theoretical basis of the observation. Using BIOVIA Discovery studio software, molecular docking operation was performed to identify and infer the phytochemical (bisdemethoxycurcumin, benzene, chrysin,guaiazulene and coumarin), that could a significantly interact with the protein. It was found that bisdemethoxycurcuminand benzene can form strong bond with the protein and could successfully inhibit the metabolic activities that are associated with the parasite. Thus, this study could explain that the presence of bisdemethoxycurcumin and benzene provided medicinal values to *Curcuma longa*against giardiasis that is caused by *Giardia lamblia*.

ABSTRACT

The mixture of a substance with another substance results in blend. The compatibility of 12cd-Glucose and Dichloro-Ethylene were studied to form a mixable blend using Biovia Materials Studio. The miscibility of the two substances was demonstrated on free energy of mixing, chi parameter, phase diagram and mixing energy. The results stipulated that the pair can become congruent at both low and high temperature. Phase diagram specify that a single phase can be obtained above 387.5K which was the critical temperature. The mechanical properties of the composite were reviewed based on bulk modulus, shear modulus, Young's modulus, Poisson ratio and brittle stress fracture. The results indicated that the values of all the properties increased with increase in mass fraction of dichloro-ethylene. The composition of the blend was examined with respect to heat capacity, thermal conductivity and dielectric constant which are permeability properties. The molar volume and density decreased with increase in dichloro-ethylene fraction. The permeability properties of the composite were studied based on permeability of oxygen, nitrogen and carbon dioxide. The results showed that the permeability for all the gases decreased with increase in mass fraction of dichloro-ethylene. This study will not only help to determine pairs without performing laboratory experiments but also less time consuming and low cost process.

INTRODUCTION

Since primeval times, the mankind is largely dependent on plants for treating common diseases and many of these traditional techniques are still included as part of the routine treatment of many maladies [1]. Folk medicine, having originfrom plants, are currently gaining regards due to their natural originspecially in the developing countries, where modern health services is still limited. However, in the absence of a scientific evidence, such medication is

seen with a suspicion of having serious adverse effects. Hence the thorough evaluation of the pharmacological activity of herbal extract therefore needs to be designed to make its use in economically unprivileged regions [2].In the current past, use of plant extracts and other forms of alternative medicine has gained much attention worldwide. Clinical microbiologists look forward at plant-based medications as antibioticscan be formulated form such medication and also because many of these medications are commonly available [3].In addition, overuse of several drugshas caused appearance of many resistant microbial strains so alternative medicines have become a need in the current situation [4].

In India, use of indigenous systems of medicine like Ayurveda, Unani and Sidha has never diminished. Ayurvedic texts like the 'Charak Samhita', 'Sushrut Samhita', 'Bhavaprakasha Samhita', 'Satmya Darpan Samhita', 'Sarangadhara Samhita', 'Vaisajya Ratnabali,' 'Rasatarangini' have explained numerous remedies for treating several ailments. In fact, many plant-based medications are still in demand for treating variety of diseases like inflammatory conditions, arthritis, bronchitis, tuberculosis, congestive cardiac failure, cancer, etc. The medicinal value of the plants lies in the chemical substances present in them, that can produce distinct physiological effect on human body, these substances are called phytochemicals,which have gained attention for their therapeuticefficiency. Plants based medicinal composition can be derived from all parts of plant such as their barks, leaves,roots, flower, fruits, and seeds. Various medicinal plants with their phytoextracts are reported to have numerous medicinal qualities, like anti-microbial, anti-diabetes, anti-oxidant, anti-inflammatory,anti-cancer, etc [5].Clove belonging to the family of Myrtaceae,can be used to cure disease like candidiasis and certain other infections due to its medicinal properties. Clove is known to contain phytochemicals such aseugenol, gallic acid, kaempferol, β-caryophyllene, campestrol, myricetin, oleanoic acid, vanillin, rhamnetin and stigmasterol. There is a greater probability that the medicinal value of clove owes to several of the phytochemicals present in it[6]. However, there are notmany reports identifying the specific phytochemical responsible for the cure of candidiasis.

Fungal infections are a common disorder, effecting people commonly throughout the world. Particularly rural areas of developing nations are affected by it, due to improper sanitation, insufficient dietary food and supplements, etc, as fungal infections can affect people in all age groups. A group of fungi belonging to the genus Candida generally cause Candidiasis. Candida fungus typically habitatsthe skin, gastro-intestinal tractand vagina and sheds through vaginal secretions. Humans become infected most frequently by this decrease due to antibiotics, poor eating habits, hormonal imbalance near menstrual period, stress, lack of sleep, weak immune system.This study focuses on the identification of the phytochemical from*Syzygium aromaticum*that are responsible to cure Candidiasis caused by *Candida sp.*

MATERIALS AND METHODS

Software used

Dassault Systemes BIOVIA, Discovery studio was used for analysis in the current study. It is a new formulation for conducting predictions for biologics, that utilizes machine learning techniques in order to predict the level of molecular interaction between the ligand and the enzyme.

List of phytochemicals

Phytochemicals are secondary metabolites that are produced by plants, which have protective effects in them. On absorption of these phytochemicals, they provide immunity against bacteria, viruses, fungi, etc. Reports have suggested that *Syzygium aromaticum*contains phytochemicals such as eugenol, gallic acid, kaempferol, β-caryophyllene, campestrol, myricetin, oleanoic acid, vanillin, rhamnetin and stigmasterol. It has been established that *Syzygium aromaticum*plant belonging to Myrtaceae family has potential to help control Candidiasis. This work is focused on identification particular phytochemicals from *Syzygium aromaticum*that could be responsible for inhibiting and controlling of Candidiasis.

Enzyme found in *Candida*

It has been reported that candidiasis can be caused as a result of *Candida sp.* infestation[7]. Variousmetabolic cycles are required by fungi for its survival. These metabolic cycles are regulated by several enzymes. RCSB enzyme database was screened for identifying and listing different enzymes essential for the metabolic pathways in *Candida sp.* fungus. It was found that enzyme dihydrofolate reductase (protein database code 3QLW) is involved in a mechanismwhere it catalyses the transfer of hydride to dihydrofolate from NADPH, this is accompaniedby protonation to produce tetrahydrofolate, which is very crucial for survival of this microbe.

Molecular docking

Here, molecular docking method was used for identifying phytochemicals from plant extract, that could act as ligand to form strong covalent bond with the fungal protein and inhibit it. The Dassault Systemes BIOVIA, Discovery studio software was used for identifying the strength of molecular interaction and for performingthe molecular docking. At first the sdf files for the phytochemicals present in *Syzygium aromaticum* were downloaded from pubchem. The protein database code of the dihydrofolate reductase enzyme was downloaded from the RCSB site. For the identification of the active site of the enzyme "receptor cavity" protocol present under "receptor-ligand interaction" menu was used. Molecular docking was carried out using C-Docker protocol of Dassault Systemes BIOVIA, Discovery studio software. The phytochemical was treated as the small molecule or the ligand molecule and the enzyme was treated to be the receptor molecule.

The "-CDOCKER_ENERGY" and "-CDOCKER_INTERACTION_ENERGY" were obtained and analysed for the better understanding of the quality of molecular docking. High positive value of "-CDOCKER_ENERGY" and "-CDOCKER_INTERACTION_ENERGY" indicated good and stable interaction between the ligand and the receptor. Thus, interaction with high values indicate major phytochemical responsible for curing the disease.

RESULTS AND DISCUSSION

Figure 1 shows the active site of dihydroxyfolate reductase (protein data base 3QLW) docked with phytochemicals present in *Syzygium aromaticum*(clove), which appears green in color. C-DOCK is a molecular dynamics (MD) simulated-annealing-based algorithm, which is a grid-based molecular docking method that is optimized for accuracy. The ligand conformations were obtained by Molecular Dynamic methods. -CDOCKER energy was calculated based on the internal ligand strain energy and receptor-ligand interaction energy. -CDOCKER interaction implies to the energy of the non-bonded interaction existing between the protein and the ligand. The best and stable interaction were chosen based on a) high positive value of -CDOCKER energy and b) small difference between -CDOCKER energy and -CDOCKER interaction energy [8]. Table 1 shows that the interaction between dihydrofolate reductase and kaempferol; dihydrofolate reductase and Myricetin; dihydrofolate reductase and Rhamnetin; dihydrofolate reductase and Vanillin has positive value of -CDOCKER energy and minimum value of the difference between - C DOCKER interaction energy and - C DOCKER energy followed by myricetin.

Thus, the results indicated that kaempferol and myricetin can effectively deactivate the enzyme thereby interrupting the biological cycle of *Candida sp*. On the other hand beta-caryophyllene, eugenol, rhamnetin, vanillin deactivate the enzyme to a certain extent. Stigmasterol, campestrol, gallic acid, oleanoic acid cannot interact with dihydrofolate reductase enzyme. Thus, the key phytochemicals preventing candidiasis infection caused by *Candida sp.* are kaempferol, myricetin, Rhamnetin and Vanillin.

CONCLUSIONS

It is known that *Syzygium aromaticum* plant has medicinal action against candidiasis, which is caused by *Candida sp*[9]. This study was carried out to provide the theoretical basis for this observation. Using Dassault Systemes BIOVIA, Discovery studio software, molecular docking was performed to identify the phytochemical that can have a

significant interaction with the vital enzyme (dihydrofolate reductase) of the microbe. It was found thatare kaempferol, myricetin, Rhamnetin and Vanillin can form strong bond with the enzyme and successfully inhibit the metabolic cycle of the microbe, explaining that these phytochemicalscanprovide medicinal values to *Syzygium aromaticum* against Candidiasis caused by *Candida Sp.*

ABSTRACT

Medicinal plants have wide potentials in treating a variety of infectious as well as non-infectious diseases. The worthiness of plants in treating disease have increased eventually due to the resistance of several microorganism towards several synthetic antibiotics. Most of these antibiotics are also associated with toxicity and side effects during prolonged treatment. Due to these reasons medicinal plants are considerably used by most of the traditional medical practitioners for the purpose of curingdiseases in their day to day practice. Phytochemicals are biologically active compounds that are obtained from plants. It has been reported that *Azadirachta indica*plant extract has several medicinal values, including the treatment of candidiasis. The plant extract is enriched withseveral phytochemicals, that attribute towards the potential effects in *Azadirachta indica*. One of the key enzymes involved in the biochemical pathway of Candidiasis which is caused by *Candida sp*is dihydrofolate reductase. Molecular docking approach for the phytochemical screening of *Azadirachta indica*against this enzyme was evaluated using BIOVIA Discovery Studio. The strength of the interaction between the ligand and the enzyme was evaluated based on -CDocker energy and -CDocker interaction energy. Positive values during the analysis indicated that phytochemicals L-ascorbic acid and oleic acid can effectively deactivate the enzymedihydrofolate reductase and interrupt the life cycle of *Candida.*

Keywords: phytochemical, BIOVIA Discovery studio, *Azadirachtaindica,Candida.*

INTRODUCTION

Several plants have found usesfor their therapeutic properties, since the primeval times. Based on these properties, variety of drugs have been obtained from medicinal plants. More than 80% of individuals from developing countries depend on plant-basedformulationsand traditional medicinal system for their primary health care [1].Plants have a potential to produce diverse range of bioactive constituents and hence qualify as arich sourceforseveral types of therapeutic applications[2]. Mostly, these phytochemical compounds are secondary metabolites liketannins,

flavonoids, alkaloids, steroids, resins, fatty acids, phenol compounds, etc. Due to the presence of these metabolites, extracts from various parts of the plants can treat ailments likecough, cold, fever, diarrhoea, dysentery, bronchitis, cholera, etc. [3]. Even, plant derived products have found advantage due to easy availability, effectiveness of the compound, less side effects and reduced cost [4].Presently, antibiotic resistance in medically relevant microbes is of major concern that is faced by the world. Also, the indiscriminate use of synthetic antimicrobial drugs has caused multiple drug resistance. Moreover, antibiotics at times can cause adverse effects on the hostsimmunity such ashypersensitivity, allergies, immune-suppression, etc. This has sparged the need to develop an alternative to synthetic drugs for the treatment of infectious diseases[5].

Therapeutic plants have enormous potentials in the treatment of infectious diseases and can simultaneously minimize side effects that are often associated with synthetic drugs [6]. Neem belonging to the family Meliaceae, is used to cure several diseasesincluding candidiasis[7]. It is known to contain phytochemicals such asnimbin, oleic acid, beta-sitosterol, glutamic acid, lactose, L-ascorbic acid, maltose, stigmasterol [8]. Certain phytochemicals present in neem, play an essential role in curing candidiasis. However, there is not much identification of the specific phytochemical responsible to cure candidiasis. Candidafungus typically invades the human gastro-intestinal tractalong with the skin and vagina and infects the intestinal tract, skin, as well as the vagina[9]. Present study focuses on the identification of phytochemicals from*Azadirachta indica*that are helpfulin the cure forCandidiasis caused by *Candida sp.*

MATERIALS AND METHODS

Software used

Dassault Systemes BIOVIA, Discovery studio was used for studying the molecular docking between the ligand and the enzyme. This software makes use of machine learning approachfor predicting the levels of molecular interaction among the molecules.

List of phytochemicals

Phytochemicals are compounds produced by plants as secondary metabolites that helps them thrive pathogens, competitors predators. Studies have suggested that consuming foods and beverages, that are rich in phytochemicals helps prevent diseases. Several works have also reported that *Azadirachtaindica*containinglactose, L-ascorbic acid, maltose, beta-sitosterol, glutamic acid, nimbin, oleic acid, stigmasterol, etc has many therapeutic applications. It has also been established that *Azadirachtaindica*plant belonging to Meliaceae family has potentials even to control the infection caused byCandidiasis. The present study is focused on identifying the phytochemicals particularly responsible for inhibiting and controlling of Candidiasis.

Enzyme found in Candida

It has been reported that candidiasis can be caused as a result of *Candida sp.* infestation. Several metabolic pathwaysare involved in the fungal life cycle for their survival. For the regulation of these metabolic cycles,many enzymes get involved in their pathway. RCSB enzyme database was used to screen and list different enzymes associated with*Candida sp.*Dihydrofolate reductase enzyme (protein database code 1M78) was selected for this study. This enzyme in general is involved in DHFR catalyses by transfer of hydride from NADPH to dihydrofolate with an accompanying protonation to produce tetrahydrofolate.

Molecular docking

Molecular docking was carried out to identify the stable interaction between the phytochemical from the plant extract and the fungal enzyme. The identified phytochemicals act as ligand and were screened for their stable interaction with the fungal protein by forming covalent bond in order to successfully inhibit the microbe. Dassault

Systemes BIOVIA, Discovery studio was used for identifying molecular interaction and performing molecular docking. For the analysis, the sdf files of the phytochemicals found in the *Azadrichata indica*plant were downloaded from PubChem. For the protein database code for dihydrofolate reductase enzyme, RCSB site was preferred. During the docking, active site of dihydrofolate reductase was identified by using "receptor cavity" protocol present in "receptor-ligand interaction" menu of BIOVIA Discovery Studio. Molecular docking for interaction energy was evaluated using the CDocker protocol under "receptor-ligand interaction". The enzyme dihydrofolate reductase was treated asreceptor and the selected phytochemicals were treated as the small molecules or ligands. The values of "-CDOCKER_ENERGY" as well as "-CDOCKER_INTERACTION_ENERGY" were used for identifying for the quality of docking and interaction. Results withgreater positive values indicated the presence of a good interaction between the ligand and the receptor and a lesser difference between "CDOCKER_ENERGY" and "-CDOCKER_INTERACTION_ENERGY" indicated a stable interaction. Thus, the interactions with high values suggested the phytochemical responsible for curing of Candidiasis.

RESULTS AND DISCUSSION

Figure 1 shows the active site present in dihydrofolate reductase enzyme, which appears light green color. CDOCK is a molecular dynamics (MD) method that predicts the molecular interaction between the small molecule and the targeted protein, by using simulated-annealing-based algorithm. -CDOCKER energy was calculated for the study was analysedbased on the internal ligand strain energy as well as receptor-ligand interaction energy. -CDOCKER interaction implies the energy of the non-bonded interaction which exists between a ligand and a protein. The most efficient interaction among all interactions was selected based on a) greater positive value of -CDOCKER energy and b)minimum difference between -CDOCKER energy and -CDOCKER interaction energy [10].From the present study, it was observed that Table 1 shows that dihydrofolate reductase-Oleic acid interaction has the highest positive value of -CDOCKER energy(35.2949) and minimum value of the difference (15.1433) between - C DOCKER interaction energy and - C DOCKER energy followed by L-ascorbic acid. Thus, the results indicated that Oleic acid and L-ascorbicacid can have some deactivatingeffect ondihydrofolatereductase enzyme and are able to interrupt the biological cycle of *Candida sp.*to some extent. Maltose, nimbin, stigmasterol, lactose, glutamic acid cannot interact with dihydrofolate reductase enzyme. Table 1. Results of CDocking of phytochemicals with dihydrofolate reductase (receptor)

CONCLUSIONS

It is already known that*Azadrichata indica*has immense medicinal potentials. In the present study we have tried evaluating its efficiency in treating candidiasis, which is caused by *Candida sp.* This study was carried out in an attempt to provide theoretical basis of this observation. Using Dassault Systemes BIOVIA, Discovery studio, molecular docking operation was performed to identify the phytochemical that could have some activity against the vital enzyme (dihydrofolate reductase) of the microbe. It was found that Oleic acid and L-ascorbic acid can form interaction with the enzyme and inhibit its metabolic cycle to some extent whereas, nimb, lactose, stigmasterol, maltose and glutamic acidcannot deactivate the enzyme. Thus, this study could explain that the presence of Oleic acid and L-ascorbic acid provided the medicinal values to *Azadrichata indica*against Candidiasis caused by *Candida Sp.*

ABSTRACT

The secondary bioactive components in plants are known asphyotochemicals. It has been reported that such phytochemicals have therapeutic propertiesthat have shown tremendous potentials in treating several diseases. Rheumatoid arthritis, which is a chronic, progressive, disabling autoimmune disease, that is characterized by systemic inflammation occurring in the joints, has gained importance due to its increased occurrence based on the current lifestyle adaptation by majority of the people. It is a systemic disease which means, it can affect the entire. Medicinal properties of several herbs and plants in various forms have shown reliving effectsin the pain and inflammation in joints, caused due to Rheumatoid arthritis. Several reports have shown that phytochemicals such as Aloe vera has therapeutic action against Rheumatoid Arthritis (RA). The enzymatic pathway involved in Rheumatoid arthritis include several functions associated with cyclooxygenase enzyme. In the present study, molecular docking of the phytochemicals that are present in *Aloe barbadensis miller* was carried out with the enzymecyclooxygenase using BIOVIA Discovery Studio. The strength of the interaction and its efficacy was interpreted based on the values of -CDocker energy and -CDocker interaction energy obtained in the docking. Values that were skewed towards the positive side for both CDocker energy as well as -CDocker interaction energy indicated that among the various phytochemicals evaluated,Salicyalic acid can effectively deactivate cyclooxygenase interrupt with its enzymatic activity

Keywords: Phytochemical, BIOVIA, Discovery studio, cyclooxygenase, Rheumatoid Arthritis.

INTRODUCTION

The medicinal values of these plants lie in the chemical substances present in them, that have definitive physiological effect on human body [1].Medicinal plants, since time worn, have been used in all intent and purpose as a source ofmedicine. It isestimated that approximately 80- 85% of population both in developed as well as developing nations rely on traditional therapeutics for primary health care needs. It ispresumed that a major part of thecustomary therapy involves use of plant extracts as the activeingredient [2].

Since ages various ailments and infectious disease have found remedies by use of herbal constituents throughout the world. Thus, scientists are considerably turning their attention to natural products, either in the form of pure compounds or in the form of standardized plant extracts, in search for new leads towards developing better drugs against several diseases [3]. Pathogenic microoganismsleadto a number of diseases by invading into the organs or throughtoxigenesis. Synthetic antibiotics although are effective in treating such diseases, but they still could cause oxidative stress leading to damage of DNA, proteins and lipids in human cells. Thus, medicinal plants have emerged as an alternate to theuse of synthetic drugs, as they contain phytochemicals and antioxidants that could tile the way towards development of antimicrobial drug, curative in cancer therapy[4]. But now a days due to our bad and unhealthy food habit and life style a list of life style related diseases are arising gradually like high blood press, diabetes, arthritis etc.

Rheumatoid arthritis (RA) is a systemic disease that manifests rheumatoid nodules, vasculitis, eye inflammation, cardio pulmonary disease[5]. Rheumatoid arthritis is not an inherited disease. Researchers believe that some people developed genes that make them susceptible towards this disease. People with such susceptible genes will however not automatically develop rheumatoid arthritis. There occurs a "trigger," such as an infection or some environmental factor, which activates this gene. When the body is exposed to such triggers, the immune system responds inappropriately. Instead of protecting the joint, the immune system itself initiates to produce substances that could attack the joints. Hence, RA is an autoimmune disease which means that the body's immune system mistakenly attack on its healthy tissues in case of RA. The normal joint lining is usually thin and has very few blood vessels in it but in caseofRA, joints lining becomes thick and crowded with white blood cells. These white blood cells secrete chemical such as interleukin-1 (IL-1) and tumor necrosis factor alpha (TNF-alpha) that cause joint swelling, damage and pain in the joints [6].

Rheumatoid arthritis is a chronic inflammatory condition affecting the bone joints causing swelling, pain and stiffness that can gradually lead to the substantial loss of functioning and mobility in advanced stages [7].High levels of immunoreactive cyclooxygenase (Cox; prostaglandin H synthase) are present in the synovia of patients suffering from rheumatoid arthritis[8]. Effects of RA are not only limited to extreme physical distress but they can also cause mental distress in the patients suffering from it. As the etiology behind RA prognosis is clearly understood, confirmed curative measures are not developed till date. All current treatment regimens and therapies such as cytokine therapy (anti-TNFα therapy) or Disease Modifying Anti-Rheumatic Drugs (DMARDs) are limited to reduction of its symptoms and to delay its pathogenesis. Thus, RA has become an undeniable threat to human life, for which preventive measures must be developed sooner [9].

In the recent times, a large array of research is directed towards the search for herbal solutions to the treatment of the diseases. In Indian Ayurveda, one such promising herbal candidate that has anti-arthritic effect is *Aloe vera* (Family Xanthorrhoeaceae), a perennial succulent xerophytic plant. *Aloe vera* has been used for many centuries for its curative and therapeutic properties [10]. In this plant water gets held in the form of viscous mucilage within its thin walled parenchymatous cells that are located in the innermost part of the leaves. *Aloe barbadensis miller*is cultivated in Europe and also in several parts of India, including north-west Himalayan region. Aloe vera is considered to be among the important plants used in folk medicine. Anthraquinone, anthracene, cinnamic acid and anthranilic acid are some important constituents present in it, that are responsible for its activity. Aloe vera is used in variety of skin

ailments such as mild cuts, bruises, insect stings, eczema, poison ivy. It has antibacterial and antifungal properties, which is implied for blood purification, anti-inflammatory activity, diuretic, uterine tonic, spermatogenic, laxative, purgative activity and fever reliever. Aloe vera is able to stimulate the immune system and is hence a powerful anti-inflammatory agent[11, 12]

Aloe vera gel is traditionally consumed or applied dermally to reduce the pain caused in joints. Phytochemical screening of *Aloe vera* confirms the presence of flavonoids, alkaloids, resins, tannins, steroids, etc in it[13].The anti-arthritis property of aloe vera is attributed to the presence of anthraquinone compound in it [14].*Aloe vera* is a perennial, drought-resisting, succulent plant that belongs to Asphodelaceaefamily. The name,aloe, is derived from the Arabic "alloeh" or Hebrew "halal" meaning bittershiny substance. It has a crucial role in indigenous system of medicine such asayurveda,unani, siddha, and homoeopathy [15].*Aloe Vera* or the Sanskrit name "Ghee kunwar" has lance-shaped, sharp pointed and jagged & edged leaves. It is found as a wild herb along the coast of south India. It is under cultivation in fairly large areas in many parts of India viz; Tamil Nadu, Gujarat, Maharashtra etc [16].

MATERIALS AND METHODS

Software used

For the evaluation of the interaction, Discovery studio module of BIOVIA software (Dassault Systemes of France) was used. This software makes use of machine learning techniques for predicting the level of molecular interaction between the ligand and the enzyme.

List of phytochemicals

Phytochemicals are plant based secondary metabolites that enables protection from predators. These plant components on consumption provides immunity to ward off several diseases in humans, hence they are also utilized in the form of traditional medicine. Published works have reported*Aloe barbadensis miller*to contain Salicyalic acid,Aloinin it, which have shown several beneficial effects. It has already been established that *Aloe barbadensis*plant belonging to familyAsphodelaceae has potential in controlling Rheumatoid arthritis. The current study is focused on identification of the particular phytochemical responsible for inhibiting and controlling Rheumatoid arthritis in patients.

Enzyme Responsible for Rheumatoid arthritis (RA)

Rheumatoid arthritis can be caused as a result of several enzymatic pathways leading to bone erosion.These enzymatic pathwaysrequire the use of various enzymes to play crucial role in causing the disease. For the identification and screening of the enzyme crucial for Rheumatoid arthritis, BRENDA enzyme database was used. It was found that cyclooxygenaseenzyme (protein database code 3N8Y) is involved in some major pathways associated with rheumatoid arthritis.

Molecular docking

Molecular docking using C Docking method was carried out to identify the phytochemicals from *Aloe barbadensis miller*, that could probably act as ligand to form strong covalent bond with the human protein and inhibit it. The Discovery studio module of BIOVIA software was used for evaluating the molecular interaction by molecular docking. During the process, the sdf files for the particular phytochemicals from*Aloe barbadensis miller* plant were downloaded. The protein database code of cyclooxygenase enzyme was also identified. For identification of the active site of the enzyme “receptor cavity” protocol under "receptor-ligand interaction" menu was used. Molecular docking was carried out using the CDocker protocol under “receptor-ligand interaction”. The phytochemical was considered as the small molecule or the ligand that interacts with the enzyme, which was considered as the receptor molecule.The“-CDOCKER_ENERGY” and “-CDOCKER_INTERACTION_ENERGY” were used as indicator for the

quality of molecular docking. High positive values obtained during the docking studies indicated good interaction between the ligand and the receptor. Thus, the interactions with high values owed to the major phytochemical that were responsible for curing the disease.

RESULTS AND DISCUSSION

Figure 1 shows the active site of the enzymecyclooxygenase, that appears light greenin color. CDOCK is a molecular dynamics (MD) simulated-annealing-based algorithm, which is grid-based molecular docking technique and is optimized for accuracy. The ligand conformations for this study were obtained by Molecular Dynamic methods.-CDOCKER energy was calculated on the basis of internal ligand strain energy and receptor-ligand interaction energy. -CDOCKER interaction signifies the energy of the nonbonded interaction existing between the protein and the ligand.The most efficient interaction of the ligand with the protein was screened on the basis of the positive value of -CDOCKER energy and small difference between -CDOCKER energy and -CDOCKER interaction energy [17].

Table 1 shows that interaction ofcyclooxygenase with several phytochemicals, out of which salicyalic acid has the highest positive value of -CDOCKER energy i.e. 18.86 and a minimum difference between - C DOCKER interaction energy and - C DOCKER energy i.e. 3.2. This wasfollowedby Aloin. Thus, the results indicated that salicyalic acid can effectively deactivate thecyclooxygenase enzyme thereby interrupting the biological enzymatic pathway associated with rheumatoid arthritis. Higher positive values for salicyalic acid indicated that it was the most active component against cyclooxygenase. Thus, the key phytochemicals preventing Rheumatoid arthritis areSalicyalic acid and Aloin.

CONCLUSION

Aloe barbadensis miller is a popular medicinal plant. The phytochemicals from this plant was assayed against Rheumatoid arthritis. Rheumatoid arthritis is caused by cyclooxygenase. This study was carried out to provide a theoretical basis to this observation. Using Discovery studio BIOVIA software, molecular docking operation was carried out to identify the phytochemical (salicyalic acid,aloin) that showed a significant interaction with the enzyme. It was found that both can form strong bond with the enzyme and can successfully inhibit its enzymatic pathway. Thus, this study could explain the role ofsalicyalic acid and aloinin providing medicinal values to *Aloe barbadensis miller* against Rheumatoid arthritis.

ABSTRACT

Phytochemicals are non-nutritiveplant-based compounds, which are considered to show efficiency against several pathogens. *Azadirachta indica* popularly known as Neem has several medicinal effects. In the current study, the plant extract was studied for drugs like properties against rheumatoid arthritis. One of the key enzymeinvolved in rheumatoid arthritis is cyclooxygenase (COX2) which causes joint destruction in rheumatoid arthritis.The extracts from neem plant contains different phytochemicals which were studied for their activity against cyclooxygenase. The molecular docking of the phytochemicals with the enzyme was studied using BIOVIA Discovery Studio. The strength of the interaction was evaluated based on -CDocker energy and -CDocker interaction energy. The high positive interaction energy of the phytochemical can be considered to be due toits effectiveness on enzyme. Out of different phytochemicals Anthelmintic and ethyl acetate shows the high positive interaction against the enzyme. So these two phytochemicals can be concluded to be able to deactivate the enzyme.

INTRODUCTION

The current health conditions when compared to the previous days seems to be deteriorating to a larger extent.Previously, the lifestyle was dependent on the natural environment andwas comparatively healthier. Today, the modern life style, is fast paced, comfortable, stressful and unhealthier. Changing work condition, decrease in physical activity, sedentary jobs types, comfortable but stressful life along with bad eating habits has exposed us to some dangerous health hazards like blood pressure, diabetes, obesity etc. If caution and changes in lifestyle are implemented, we can prevent these lifestyle related diseases from increasing further.Nature is animmense source of medicinal agents for millions of years. Many pharmaceutical industries are dependent on natural sources for production of modern drugs. Even in the current era, we are highly dependent on traditional medicine.Nutraceuticals have also gained significance with the increasing demand for health supplements, as

nutraceuticals are nutritionally or medicinally enhanced foods, that have health benefits. They include engineered grains; cereals supplemented with vitamins and even minerals or genetically manipulated soybean and canola oil without trans fatty acids[1, 2].The WHO estimates that approximately 80% people rely on traditional medicine for their primary health care needs. Since medicinal plants are the 'backbone" of traditional medicine, hence majority of people are reported to dependon medicinal plants on a regular basis [3]. The medicinal value of the plants lies in some chemical substances that are present in it and can produce a definite physiological action on the human body, such substances are called phytochemicals, and have therapeutic applications. Plants based therapeutic components can be derived from any part of plant like bark, leaves, flowers, roots, fruits, and seeds [4]. Various medicinal plants and their phytoextracts are reportedto have numerous therapeuticbenefits like anti-microbial, anti-diabetes, anti-oxidant, anti-inflammatory, anti-cancer, etc. [5]. Many of the medicinal plants are used as spices and food items, they also have applications as medicines like allopathic medicine, herbal medicine, alternative medicine, homoeopathy and aromatherapy [6].Among different sources of natural products, plants have been a source of novel chemical substance, which serves as starting materials for a number of old and new pharmaceutical products. Plants that demonstrated efficiency such as anticancer, antioxidant, anti-inflammatory, immunostimulatory and antimicrobial properties have received research attention.

In the current study, *Azadirachtaindica*that belongs to family Meliaceae was used to choosen to study its effectiveness against Rheumatoid arthritis.Rheumatoid arthritis is a chronic inflammatory disease which causes joint destruction. It is reported that Cyclooxygenase enzyme causes the increase in prostaglandin synthesis at the infection site. Cyclooxygenase (COX-2) is known to be upregulated *in vitro* by inflammatory agents, like lipopolysaccharide, IL-1 and TNF [7]. The phytochemicals of *Azadirachtaindica* are reported to be anthelmintic, nimbin, nimbinin, nimbidin, ethyl acetate, petroleum ether. etc. There is high possibility that these phytochemicals play a major role in curing join infection in arthritis. However, there is no report identifying the specific phytochemical responsible to cure arthritis. Hence the current study helps in identifying the phytochemicals that have specific activity against Rheumatoid arthritis.

MATERIALS AND METHODS

Software used

Discovery studio module of BIOVIA software (Dassault Systemes of France) was usedfor docking inthe present study. This software utilizes machine learning techniques in order to predict the level of molecular interaction taking place between the ligand and the protein molecule.

List of phytochemicals

Phytochemicals are produced by plants as secondary metabolites to protect them from predators. These phytochemicals show potential activity against several bacteria, viruses, fungi etc.When these plants or their parts are consumed, their phytochemicals help fight off threats to the health. All parts of *Azadirachtaindica* i.e. its leaves, flowers, seeds, fruits, roots and bark are used traditionally for the treatment of infections,skin diseases,inflammation, dental disorders, etc. As this plant has immunomodulatory, anti-inflammatory, antihyperglycaemic, antiulcer, antimalarial, antifungal, antibacterial, antiviral, antioxidant, antimutagenic and anticarcinogenic properties[8].*Azadirachta indica* contains various phytochemicals such as Anthelmintic, Nimbin, Nimbolide,ethyl acetate, petroleum ether, Azadiradione, etc which were all studied to analyse their activity against Rheumatoid arthritis.This study was focused on identification of the particular phytochemical responsible for inhibiting and controlling of rheumatoid arthritis.

Enzyme involved in arthritis

Rheumatoid arthritis is a chronic inflammatory disease which causes the join destruction. Cyclooxygenase enzyme causes the increase in prostaglandin synthesis at the infection site.There are particularly two forms of

cyclooxygenase, which are, cyclooxygenase-1 (COX-1) that maintains house-keeping functions and the other one is cyclooxygenase-2 (COX-2), whichshows response towards inflammatory condition. COX-2is reported to be present in synovial tissue of patients with rheumatoid arthritis and to a less extent COX-1 is also present. COX-2 expression in the rheumatoid synovium is induced by proinflammatory cytokines, specially by IL-1, whereas,COX-2 expression is inhibited by corticosteroids[9]. Cyclooxygenase (COX-2) has been shown to be upregulated *in vitro* by inflammatory agents, like lipopolysaccharide, IL-1 and TNF[7]. These mediators are involved in rheumatoid arthritis and cancer-induced angiogenic processes. It is reported thatcyclooxygenase (COX)-2 upregulation in osteoarthritis and rheumatoid arthritis is associated with the pain and inflammation during the diseased state. COX-2 is generally not expressed normally, but is rapidly induced in response to inflammatory stimuli and is responsible for production of large amounts of prostaglandin E2 (PGE2)and other arachidonic acid metabolites at the inflammatory sites.COX-2 is involved in pathophysiologic processes, such as, inflammation, pain, and fever.In the late 1980s, it was shown that expression of COX activity is markedly stimulated by interleukin-1 in fibroblasts and monocytes and gets inhibited by corticosteroids[10].

Molecular docking

Molecular docking method was conducted to identify the phytochemical from the plant extract, that act as a ligand to form a strong covalent bond with the bacterial protein in order to inhibit the microbe. The Discovery studio module of BIOVIA software was used for identifying molecular interaction and perform molecular docking. The sdf files for the phytochemicals present in *Azadirachta indica* plant were downloaded from PubChem website. The protein database code forthe enzyme Cyclooxygenase was identified from the website (rcsb). To carry out the docking procedure, the active site of the enzyme was first identified in the "receptor cavity" protocol under "receptor-ligand interaction" menu. Molecular docking was carried out using the CDocker protocol of BIOVIAsoftware under "receptor-ligand interaction". The enzyme molecule was considered as the receptor in the interaction and the phytochemical was treated as the ligand. The "-CDOCKER_ENERGY" and "-CDOCKER_INTERACTION_ENERGY" were used as indicator to interpret the quality of molecular docking. The high positive value of them indicated a good interaction between the ligand and the receptor. Thus, the interactions with high values indicated the phytochemical showed activity in inhibiting the enzyme associated with the disease.

RESULTS AND DISCUSSION

Figure 1 shows the active site of the cyclooxygenase enzyme. It appears as light green color. CDOCK is a molecular dynamics (MD) simulated-annealing-based algorithm. It is a grid-based molecular docking method which is optimized for accuracy. The ligand conformations were obtained by Molecular Dynamic methods.-CDOCKER energy was calculated based on the internal ligand strain energy and receptor-ligand interaction energy. -CDOCKER interaction signifies the energy of the nonbonded interaction that exists between the protein and the ligand. The criteria for best interaction was chosen based on a) high positive value of -CDOCKER energy and b)small difference between -CDOCKER energy and -CDOCKER interaction energy.

Table 1 shows that Interaction between cyclooxygenase- anthelmintic to be the highest -CDOCKER positive value which is(28.0012) and the minimum difference between –CDOCKER energy and interaction energy is(1.5807).Interaction values for cyclooxygenase-anthelmintic is followed by interaction between cyclooxygenase-ethyl acetate.This shows that anthelmintic and ethyl acetate can effectively interact with cyclooxygenase thereby inhibiting itsenzymatic activity. Whereas, Nimbin and anticarcinogenic phytochemicals cannot detect the enzyme. So key phytochemicals in *Azadirachtaindica*preventing rheumatoid arthritis could be anthelmintic and ethyl acetate.

CONCLUSIONS

It is reported previously that neem (*Azadirachta indica)* plant has medicinal value which can act as curative for many diseases and is also used for rheumatoid arthritis. This study was carried out to provide the theoretical basis of this

observation. Using Discovery studio module of BIOVIA software, molecular docking operation was performed to identify the phytochemical (Anthelmintic, Petroleum ether, Nimbolid, Ethyl acetate, Nimbin, Anticarcinogenic) which can have a significant interaction with the vital enzyme (cyclooxygenase). It was found that Anthelmintic can form strong bond with the enzyme successfully inhibiting the enzyme. But Nimbin, Anticarcinogenic cannot interact with enzyme. Thus, this study shows that the presence of Anthelmintic, Ethyl acetate provides the medicinal value against cyclooxygenase enzyme of rheumatoid arthritis.

ABSTRACT

Ultrasonic machining (USM) process is use for cutting of non-conductive, brittle workpiece materials such as inorganic glasses, titanium alloys and engineering ceramics etc. Unlike other non-traditional machining processes, it doesnot thermally damage the workpiece or introduce significant levels of residual stress. Ultrasonic machining process has multiple performance measures, e.g. material removal rate (MRR), tool wear rate (TWR), surface roughness (SR) etc, which are affected by several process parameters. In the present study, four multi response optimization methods like Grey Relational Analysis (GRA), Multi Response S/N Ratio (MRSN), Weighted S/N Ratio (WSN) and VIKOR Method are presented and a set of past experimental data on USM process is analysed using these methods. The relative performances of these methods are then compared. The result shows that all the four methods give the same optimal condition for USM process but Weighted S/N ratio (WSN) method is preferred as it requires lesser mathematical calculations compare to others

Keywords: Blend, In Silico, 12α-d-Glucose, Dichloro-Ethylene

INTRODUCTION

Materials play an important role in the advancement of science and technology and the human society. Advancement in automotive, aircraft, electronics industries demand for the requirement of advanced materials. As these are working in adverse conditions, the materials used should have the required properties like high impact strength, high hardness, high temperature resistance, high corrosion resistance, low reactivity, low weight etc. In order to fulfil the demands, the researchers have been working since long to develop new types of materials. The

demand for macro-, micro- and nano products and components of difficult-to-machine materials such as tool steel, carbides, super alloys, titanium alloys and nanostructure materials has been rapidly increasing in automotive, aerospace, electronics, optics, medical devices and communications industries. Conventional machining is incapable of machining such materials with desired accuracy and surface finish. Non-traditional machining processes (like Electrical Discharge Machining (EDM), Electrochemical Machining (ECM), Ultrasonic Machining (USM) etc.) offer a better alternative or sometimes the only alternative in generating accurate 3-D complex shaped features and components of these difficult-to- machine materials. A lot of work has been carried out in the field of process optimization. The researchers have developed a number of optimization techniques to fulfil the current requirements.Caydas*et al.*[1] developed an artificial neural network (ANN) and regression model to predict surface roughness of AA7075 aluminium alloy in abrasive water jet machining (AWJ) process.

The machining parameters like traverse speed, water jet pressure, standoff distance, abrasive grit size and abrasive flow rate were considered as model variables. The statistical analysis showed that the water jet pressure was an utmost parameter on surface roughness. The microstructures of machined surfaces were also studied by scanning electron microscopy (SEM). Rao *et al.*[2] studied the optimization of the surface roughness of die sinking electric discharge machining (EDM) by considering the simultaneous affect of various input parameters. The experiments were carried out on Ti6Al4V, HE15, 15CDV6 and M-250 work pieces. Experiments were conducted by varying the peak current and voltage and the corresponding values of surface roughness (SR) were measured. A hybrid model was developed and optimization of SR in die sinking electric discharge machining was carried out using artificial neural network (ANN) and genetic algorithm (GA). Ramakrishnan and Karunamoorthy[3] developed artificial neural network (ANN) models and multi response optimization technique to predict and select the best cutting parameters of wire electro-discharge machining (WEDM) process.

Experiments were performed under different cutting conditions of pulse on time, delay time, wire feed speed and ignition current to predict the performance characteristics namely, material removal rate and surface roughness. The responses were optimized concurrently using multi response signal-to-noise (MRSN) ratio in addition to Taguchi's parametric design approach. Zain *et al.*[4] proposed an integrated Artificial Neural Network (ANN) and Simulated Annealing (SA) techniques to estimate optimal process parameters in abrasive water jet (AWJ) machining operation. The considered process parameters include traverse speed, water jet pressure, standoff distance, abrasive grit size and abrasive flow rate.

The optimal values of these process parameters were targeted for giving a minimum value of average surface roughness (Ra). Yadav *et al.* [5] proposed an Artificial neural network (ANN) model for electrical discharge diamond cut-off grinding (EDDCG) process, to correlate the input process parameters namely current, pulse-on time, duty factor and wheel speed with the performance measures namely, material removal rate (MRR) while machining cemented carbide. Acherjee*et al.*[6] proposed a hybrid approach based on Taguchi method and artificial neural network (TM-ANN) to improve the effectiveness of optimizing quality characteristics in laser transmission welding process. The input process parameters considered were power, welding speed and focal distance. Vundavilli*et al.*[7] proposed an expert system for abrasive water jet machining (AWJM) process using Fuzzy logic (FL). It was found that the performance of AWJM in terms of depth of cut depends on various process parameters, such as diameter of focusing nozzle, water pressure, abrasive mass flow rate and jet traverse speed.

The developed expert system eliminates the need of extensive experimental work, to select the most influential AWJM parameters on the depth of cut. Joshi andPande [8] worked on intelligent approach for process modeling and optimization of electric discharge machining (EDM). Physics based process modeling using finite element method (FEM) has been integrated with the soft computing techniques like artificial neural networks (ANN) and genetic algorithm (GA) to improve prediction accuracy of the model with less dependency on the experimental data. A two-dimensional axi-symmetric numerical (FEM) model of single spark EDM process has been developed based on more realistic assumptions such as Gaussian distribution of heat flux, time and energy dependent spark radius, etc. to

predict the shape of crater, material removal rate (MRR) and tool wear rate (TWR). Ghosal and Manna [9] investigated on machining of Al/Al_2O_3 MMC by ytterbium fiber laser. The effects of the different parameters on the response characteristics were explained. A comprehensive mathematical models for correlating the interactive and higher-order influences of various machining parameters such as laser power, modulation frequency, gas pressure, wait time, pulse width on the machining performance criteria e.g., metal removal rate and tapering phenomena has been developed for achieving controlled over fiber laser machining process.

The response surface methodology (RSM) was employed to achieve optimum responses i.e., minimum tapering and maximum material removal rate. Sharma and Yadava [10] presented the modeling and optimization of cut quality characteristics during Nd:YAG laser cutting of aluminum alloy thin sheet along the curved profile. The cut quality characteristics considered are average kerf deviation (Da) and average kerf taper (Ta). The essential input process parameters were identified as arc radius of curve profile, oxygen pressure, pulse width, pulse frequency and cutting speed. First, second order response surface model was developed for each Da and Ta using hybrid approach of Taguchi methodology (TM) and response surface methodology (RSM). The effect of input process parameters on each cut quality (Da and Ta) was also studied. Second, preferred operating laser cutting parameters were obtained using grey relational analysis (GRA) with entropy measurement (EM) to minimize Da and Ta together. In the present study a comparison is made between the most widely used multi response optimization techniques like GRA, MRSN, WSN and VIKOR methods and a suitable optimization technique for USM process is proposed for practical realization.

MATERIALS AND METHODS

Taguchi [11, 12] categorized the response variables into three different types, i.e., smaller the better, larger the better and nominal the best. Assuming that there are m experimental trials and in each trial, quality losses of a set of p response variables are measured. Quality loss (L_{ij}) for j*th* response corresponding to$i$*th* trial (i=1, 2,…,m; j=1,2,…,p) for different types of response variables are given as follows:

For smaller the better, $L_{ij} = \left(\frac{1}{n}\sum_{k=1}^{n} y^2_{ijk}\right)$ (1)

For larger the better, $L_{ij} = \left(\frac{1}{n}\sum_{k=1}^{n} \frac{1}{y^2_{ijk}}\right)$(2)

For nominal the best, $L_{ij} = \left(\frac{S_{ij}^2}{\bar{y}_{ij}^2}\right)$(3)

where, $\bar{y}_{ij} = \frac{1}{n}\sum_{k=1}^{n} y_{ijk}$, $S_i^2 = \frac{1}{n-1}\sum_{k=1}^{n}(y_{ijk} - \bar{y}_j)^2$

n represents the number of repeated experiments, y_{ijk} is the experimental value of j*th* response variable in i*th* trial at k*th* replication and L_{ij} is the computed quality loss for j*th* response in i*th* trial.

The Signal-to-Noise ratio value (η_{ij}) is obtained by putting the value of L_{ij} for j*th* response in i*th* trial in the equation:

$\eta_{ij} = -10\log_{10}L_{ij}$(4)

The quality loss (L_{ij}) is normalized to reduce the variability among different responses. The normalized quality loss (S_{ij}) is given as:

$S_{ij} = L_{ij}/L_{i}$(5)

where$L_{i} = \frac{1}{m}\sum_{i=1}^{m} L_{ij}$ is the average quality loss for j*th* response.

Sometimes, signal-to-noise ratio is normalized instead of quality loss and is scaled between 0 and 1.

$Y_{ij} = (\eta_{ij} - \eta_j^{min})/(\eta_j^{max} - \eta_j^{min})$(6)

whereY_{ij} = scaled signal-to-noise ratio value for j*th* response in$i$*th* trial, η_j^{min} = min $\{\eta_{1j}, \eta_{2j},...,\eta_{mj}\}$ and η_j^{max}= max $\{\eta_{1j}, \eta_{2j},...,\eta_{mj}\}$.

The optimal parametric setting in all the four multi-response optimization methods involves:
Step 1: Converting the multiple responses into a single process performance index (PPI) for optimization.
Step 2: Determining the influencing factors and then, obtaining the optimal factor-level combination.
Step3: Validating the optimal factor-level combination using confirmatory experiment.
The four methods (GRA, MRSN ratio, WSN ratio and VIKOR) mainly differ with respect to the first step, i.e., methodology used for converting the multiple responses into the PPI value. The remaining two steps are the same for all the four methods of multi-response optimization.
The steps involve in finding the process performance index (PPI) value for the considered multi-response optimization methods are discussed below [13].

Grey Relational Analysis (GRA) method

In this method, Grey Relational Grade (GRG) is considered as the PPI. The steps for obtaining PPI are as follows:
Step 1: Calculation of the Signal-to-Noise ratio (η_{ij}) values for all the responses for all the trialsusing equation (4).
Step 2: Obtaining the scaled Signal-to-Noise ratio (Y_{ij}) values for all the responses for all the trials using equation (6).
Step 3: Computation of the grey relational coefficients.
Grey relational coefficient (γ_{ij}) for *jth* response in *ith* trial is computed as follows:

$$\gamma_{ij} = (\Delta_j^{min} + \xi\Delta_j^{max})/(\Delta_{ij} + \xi\Delta_j^{max}) \quad (7)$$

where $\Delta_{ij} = | 1- Y_{ij} |$, $\Delta_j^{min} = \min\{\Delta_{1j}, \Delta_{2j},...,\Delta_{mj}\}$, $\Delta_j^{max} = \max\{ \Delta_{1j}, \Delta_{2j},...,\Delta_{mj} \}$
and ξ is the distinguishing coefficient ($\xi \in [0,1]$). The distinguishing coefficient is used to expand or compress the range of grey relational coefficient and is usually taken as 0.5.
Step 4: Calculating the grey relational grade (GRG_i) corresponding to *ith* trial as follows:

$$GRG_i = \sum_{j=1}^{p} W_j \gamma_{ij} \quad (8)$$

whereW_j is the weight for *jth* response and $\sum_{j-1}^{p} W_j = 1$.

Multi response S/N ratio (MRSN) method

In the MRSN ratio method, the MRSN ratio is taken as the PPI value which can be obtained using the following steps:
Step 1: Obtaining the scaled quality loss (S_{ij}) for each response in each trial as follows:

$$S_{ij} = (L_{ij} - L_j^{min})/(L_j^{max} - L_j^{min}) \quad (9)$$

whereS_{ij}= scaled quality loss for *jth* response in *ith* trial, $L_j^{min} = \min\{L_{1j},L_{2j},...,L_{mj}\}$ and $L_j^{max} = \max\{L_{1j}, L_{2j},...,L_{mj}\}$.
Step 2: Computing the total quality loss (TL_i) for the *ith* trial as given below:

$$TL_i = \sum_{j=1}^{p} W_j S_{ij} \quad (10)$$

Step 3: Determining the multi-response SN ratio ($MRSN_i$) for *ith* trial as follows:

$$MRSN_i = -10\log_{10}(TL_i) \quad (11)$$

Weighted S/N ratio (WSN) method

In this method, the WSN ratio is considered as the PPI value. The computational procedure for this method can be described as below:
Step 1: Computing the Signal-to-Noise ratio values for all the responses for all the trials using equation (4).
Step 2: Obtaining the scaled signal-to-noise ratio values for all the responses for all the trials using equation (6).
Step 3: Computing the WSN ratio value for *ith* trial using the following equation:

$$WSN_i = \sum_{j-1}^{p} W_j V_{ij} \quad (12)$$

VIKOR method

Here, the VIKOR index is treated as the PPI value. The VIKOR index is computed using the following five steps:
Step 1: Computing the Signal-to-Noise ratio values for all the responses for all the trials using equation (4).
Step 2: Obtaining the scaled Signal-to-Noise ratio values for all the responses for all the trials using equation (6).
Step 3: Determination of ideal and negative-ideal solutions.

The ideal (A^*) and the negative-ideal (A^-) solutions, which represent the maximum and minimum Signal-to-Noise ratio values of all the experimental trials, are as follows:

$A^* = \{\max Y_{ij} \mid i = 1, 2,...,m\}$

$= \{Y_1^*, Y_2^*,.....Y_P^*\}$ (13)

$A^- = \{\min Y_{ij} \mid i = 1,2,...,m\}$

$= \{Y_1^-, Y_2^-,.....Y_P^-\}$ (14)

Step 4: Calculation of the utility and regret measures for each experimental trial.
The utility and regret measures for *ith* experimental trial, S_i and R_i respectively, can be obtained as follows:

$S_i = \sum_{j=1}^{p} [W_j(Y_j^* - Y_{ij})/(Y_j^* - Y_j^-)]$ (15)

$R_i = \text{Max}_j[W_j(Y_j^* - Y_{ij})/(Y_j^* - Y_j^-)]$ (16)

Step 5: Calculation of the VIKOR index of *ith* experimental trial.
The VIKOR index of *ith* experimental trial, Q_i, can be expressed as follows:

$Q_i = \nu [(S_i - S^*)/(S^- - S^*)] + (1- \nu) [(R_i - R^*)/(R^- - R^*)]$; $i = 1,2,....m$ (17)where $S^*=Min\ S_i$, $S^- = Max\ S_i$, $R^*=Min\ R_i$, $R^-=Max\ R_i$and ν is the weight of the maximum group utility which is usually set to be 0.5 .

EXPERIMENTAL DETAILS

The experimental data was taken from a previous journal "An Experimental Study on Ultrasonic Machining of Pure Titanium using Designed Experiments" by Jatinder Kumar and J.S.Khamba [14]. In their paper, they investigated the machining characteristics, i.e., tool wear rate (TWR) and surface roughness (SR) using pure titanium workpiece. The input parameters considered were tool material, abrasive material, grit size of the slurry used and power rating of the machine. The optimal condition for each machining characteristic was obtained separately using Taguchi method. The limitation of this method is that the optimal condition for multiple machining characteristics cannot be known. In the present work, same data is used for comparison of various multi response optimization techniques like GRA method, MRSN ratio, WSN ratio and VIKOR method. These techniques give the optimal condition for multiple machining characteristics. The input parameters taken were Tool material, Abrasive type, Grit size and Power rating. The output parameters taken were Tool wear rate and Surface roughness. The input parameters and their levels were taken as shown in table 1.

The constant parameters were taken as follows:
Frequency of vibration = 21 KHz
Static load = 1.63 Kg
Amplitude of vibration = 25.3 – 25.8 μm
Depth of cut = 2 mm
Thickness of workpiece = 10 mm
Slurry concentration = 25%
Tool geometry = Straight cylindrical with diameter 8 mm
Slurry temperature = 28 C
Slurry flow rate = 36.4 x 10^3 mm^3/min
Slurry media = water
L_{18} orthogonal array was selected for the given input parameters as shown in the table 2.

The experiments were conducted as per the L_{18} orthogonal array and readings were noted as shown in the table 3. In the present study, these experimental readings have been taken for the calculation purpose in order to compare various multi response optimization techniques like GRA method, MRSN ratio, WSN ratio and VIKOR method.The expressions for quality loss, S/N ratio and Scaled S/N ratio have been discussed in section 2 and the calculated values are shown in table 4.

Grey relational analysis (GRA) method:

In this method, Grey relational grade (GRG) is considered as the process performance index value. The steps to calculate the GRG values have been discussed in chapter 3 and calculated values are shown in table 5.

Multi response S/N ratio (MRSN) method

In this method, the MRSN ratio is taken as the process performance index value. The steps to calculate the MRSN ratio have been discussed in section 2 and calculated values are shown in table 6.

Weighted S/N ratio (WSN) method

In this method, WSN ratio is considered as the process performance index value. The steps required to calculate the WSN ratio have been discussed in section 2 and calculated values are shown in table 7.

VIKOR method

In this method, VIKOR index is considered as the process performance index value. The steps to calculate the VIKOR index have been discussed in section 2 and calculated values are shown in table 8.

Analysis of Variance (ANOVA)

The percentage contribution of various input parameters on the selected machining characteristics can be estimated by performing ANOVA.

Grey Relational Analysis (GRA) method

where SS = Sum of Square

DF = Degree of Freedom = Level – 1

MS = Mean Square = SS / DF

F = F value = (MS due to factor / MS due to error)

Higher the F value of the input parameter means higher effect of that parameter on performance characteristic. In Grey Relational Analysis (GRA) method, greater value of level average means better quality. So, optimal condition using Grey Relational Analysis method is $\mathbf{A_4B_1C_3D_1}$.

Multi response S/N ratio (MRSN) method

In Multi response S/N ratio (MRSN) method, greater value of level average means better quality. So, optimal condition using Multi Response S/N ratio method is $\mathbf{A_4B_1C_3D_1}$.

Weighted S/N ratio (WSN) method

In Weighted S/N ratio (WSN) method, greater value of level average means better quality. So, optimal condition using Weighted S/N ratio method is $\mathbf{A_4B_1C_3D_1}$.

VIKOR method

In VIKOR method, smaller value of level average means better quality. So, optimal condition using VIKOR method is $\mathbf{A_4B_1C_3D_1}$.

RESULTS AND DISCUSSION

The contribution of each input parameter i.e. Tool material (A), Abrasive type (B), Grit size (C) and Power rating (D) on the performance parameters - Tool wear rate (TWR) and Surface roughness (SR) has been calculated using Analysis of variance (ANOVA). In GRA method, it is found that tool material (A) has the highest contribution of 33.84% followed by power rating (D), grit size (C) and abrasive type (B) having contribution of 26.97%, 23.43% and 5.50% respectively. In MRSN method, it is found that tool material (A) has the highest contribution of 32.32% followed by power rating (D), grit size (C) and abrasive type (B) having contribution of 31.96%, 21.06% and 9.28% respectively. In WSN method, it is found that tool material (A) has the highest contribution of 29.97% followed by power rating (D), grit size (C) and abrasive type (B) having contribution of 28.47%, 27.21% and 8.80% respectively. In VIKOR method, it is found that tool material (A) is having the highest contribution of 38.54% followed by power rating (D), abrasive type (B) and grit size (C) having contribution of 26.70%, 10.61% and 10.43% respectively.

The level averages for each input parameter has been calculated for various process performance index (PPI) values. Greater value of level average of GRG, MRSN ratio and WSN ratio signify better quality. On the other hand, smaller value of level average of VIKOR index signifies better quality. In all the four methods, the optimal condition is obtained as $\mathbf{A_4B_1C_3D_1}$, i.e. the optimal combination will be as follows:
Tool material (A) – Ti alloy
Abrasive type (B) – Alumina
Grit size (C) – 500
Power rating (D) – 100 Watt

CONCLUSIONS

i. There are only a few multi response optimization techniques like Grey Relational Analysis (GRA), Multiple Response Signal-to-Noise (MRSN) ratio, Weighted Signal-to-Noise (WSN) ratio and VIKOR method which use simple computational procedures and are therefore very useful for the engineers.
ii. Using the above methods in USM process, it is found that tool material is having the highest influence on the output performance followed by power rating, grit size and abrasive type.
iii. In all the four methods, the optimal combination is obtained as $A_4B_1C_3D_1$, i.e., tool material – Titanium alloy, Abrasive type – Alumina, Grit size – 500 and Power rating – 100 Watt.
iv. All the four methods are found to be suitable for the present study but WSN method is preferred as it involves less calculation compared to other methods.

ABSTRACT

Friction Stir Welding is a solid state welding process which is used to join the soft materials like aluminium, copper, nickel, titanium etc. It uses heat generated from friction produced by rotating tool and high axial force. At elevated temperature material. Under goes plastic deformation zone which is stirred by rotating tool. On cooling, a solid bond is formed; it is called as weld nugget. FSW Process is characterized by different welding parameters like Rotation Speed, Traverse Speed, Axial load, Tool Geometry which enhances different mechanical properties such as tensile strength, yield strength, hardness, corrosion resistance etc. This paper shows effect of various welding parameters on the characteristics of weld formed during FSW.

Keywords: Friction Stir Welding, Welding nugget, High Speed Steel, Solid State Welding.

INTRODUCTION

During a friction stir welding (FSW) process, a tool rotates while at the same time its pin traverses along the welding direction under a vertical force Mishra and Ma [1]. The process produces inevitably a frictional heat thus softening the material underneath the tool. In order to obtain sufficient frictional heat, the pin length should be of a specified length. For example, Bahrami et al. [2] have welded 6mm thick 7075 aluminum alloy sheets using a pin length of 5.7 mm. Marzbanrad et al. [3] welded 3mm thick 5083 aluminum alloy sheets using a pin with a length of 2.8 mm. Welded 5mm thick pure copper using a pin with a length of 4.7 mm. In general, the pin length is consistently shorter than the thickness of sheets. As a result, the so-called kissing bond is inevitably created in the root of weld. Oosterkamp et al. [4] suggested that the kissing bond represents a partial remainder of the un-welded original butting interface, induced by an insufficient sinking of the pin during the welding process. Rotating tool serves two main functions 1.Heat can be produced by large axial force and high RPM required to soften metal 2.Stirring of materials to form weld nugget by making solid bond on cooling. During the process, material undergoes in a plastic deformation phase at high temperature which forms fine and equaxed recrystallized grains. Due to fine and

recrystallization grains mechanical properties such as tensile strength, yield strength, hardness, elongation etc can be improved (Fig. 1)

Benefits of friction stir Welding

- It can be used with conventional vertical milling machine.
- It utilizes simple, non-consumable and economical tooling.
- No filler material or shielding gas is required to join the material.
- As the soft material used for joining, less energy required to weld.
- No special purpose and costly fixture is required for holding the work piece.

During the process observed zones are as shown in fig.2.,

Heat Affected Zone (HAF): This zone experiences a thermal cycle, but does not undergo any plastic deformation. It retains the same grain structure as the parent material

Weld Nugget (WN): It is the metal structure formed after cooling of stirred zone which creates strong bond between the two metals under the welding. Recrystallized fine grain structures in the form of onion rings are observed.

Thermo-Mechanically Affected Zone (TMAZ): It is highly deformed zone. The base metal contains elongated grains were deformed in an upward flowing pattern around the nugget zone. Although the TMAZ underwent plastic deformation, recrystallization did not occur in this zone due to insufficient deformation strain.

Base Material (BM): The unaffected zone which does not experience effect of welding parameters.

Literature Review

Wei et al.[5] conducted experiments on 2mm thick 01420 Al-Li alloy plates with different welding parameters pin rotation, welding speed, welding pressure. Groove type defect was observed at low speed welding. At very high speed surface quality became poor; groove type defect could be seen. At inappropriate speed, tunnel type defect could be observed. At high axial pressure, it would be caused depression and wavy burrs.

At low axial pressure tunnel and groove type defect occurred. At small shoulder value frictional heat input was low.

It was found that hardness value was high in stir zone than base metal. Hardness tended to decrease with an increase

in heat input due to different thermal effects with welding conditions. Very fine equi axed recrystallized grain structure was obtained in stir zone after dynamic recryastalization. Heat input had little influence on joint strength.

Zhang et al. [6] carried experiments in underwater conditions of AA2219 alloy. Tensile strength of the joint was found to be improved from axial load of 324 MPa by external water cooling action in normal to 341 MPa with deterioration of plasticity of weld nugget. Underwater joint was found to be fractured at the interface between NZ and TMAZ on advancing side during tensile test. Underwater FSW joint exhibits lower hardness in NZ and Higher Hardness in TMAZ and HAZ when compared with normal FSW

Patil et al. [7] investigated effects of different welding speed and tool pin profiles on the weld quality of AA6082-O aluminium where tool rotation was kept constant. Joint fabricated with taper screw thread pin exhibits superior tensile strength than tri-flute pin irrespective of welding speed. Taper screw thread joints fabricated at weld speed of 70 mm/min shows more ultimate and yield strength than weld speed at 60 mm/min and 75 mm/min. Four flute joints fabricated at a welding speed of 60mm/min shows superior properties than 70 mm/min or 85 mm/min Koilraj et al. [8] carried out joining of dissimilar Al-cu alloy AA2219-T87 and Al-Mg alloy AA5083-H321 with taguchi L16 orthogonal design of experiments. He found that fusion welding of dissimilar aluminium alloys was very challenging due to formation of low melting eutectic by constituent element resulting in cracking. Significant drop in hardness from AA2219 unaffected base material to weld nugget on advancing side have been observed. On retreating side only slight drop in hardness was observed from weld nugget AA5083 unaffected base material. In tensile test three weld specimens failed in AA5083 side HAZ. High strength joint can beobtained by placing base material on advancing side. Cylindrical threaded tool profile found to be best during welding. D/d ratio played an important role and contributes to 60 % to the weld strength. Tutar et al. [9]conducted study on non heat treatable

AA3003-H12 aluminum alloy sheets to find optimum welding conditions using taguchi orthogonal array with due Consideration of tensile shear load. Three different parameters rotational speed, plunge depth and dwell time were considered during the study. Plunge depth was found to be the most significant parameter with contribution of 69.26 %.As plunge depth was increased; tensile shear load of fsw joint also increased with expansion of HAZ, TMAZ and SN zones. All fractures of the joints in tensile testing occurred in SZ, where bonding section size was small.
Hardness in SZ decreased as the tensile shear load increased. Fine grain structure in the SZ was found at higher Hardness value.

Kumar et al. [10] investigated effect of rotational speed, weld speed, axial load, on tensile strength and % elongation during welding of dissimilar aluminium AA5083-O and 6061-T6. Study revealed that increase in RPM, axial load and welds speed increases tensile strength up to a point further increase in rpm, axial load and weld speed decreased the tensile strength. It was observed that increase in tool rotation and axial force resulted in increase in percentage elongation whereas increase in welding speed resulted in decrease of percentage elongation.

Kadaganchi et al.[11] formulated a mathematical model with spindle speed, welding speed, and tilt angle and tool geometry to predict the yield strength, tensile strength, % elongation of friction stir welds of AA2014-T6 aluminium alloy. Hexagonal tool profile produces higher pulsating effect and smooth material flow which resulted in improved mechanical properties, whereas conical tool profile produced the lowest mechanical properties. Increase in tool tilt angle led to better consolidation of material which improved mechanical properties. When welding parameters were not appropriate defects like turbulence, warm hole, tunnel effect, crack, excess flash and thinning of weld were observed. Flat faced tools produced pulsating effect and better plastic flow. Welding defects can be eliminated by increasing tool tilt angle

Barekatain et al. [12] studied joining of AA 1050 aluminium alloy and commercially pure copper. The annealed and severely plastic deformed sheets were subjected to friction stir welding (FSW) at different rotation and traverse speeds. It was observed that traverse speed range of 50-100 mm/min and rotation speeds of more than 900 r/min produce welds with appropriate surface in annealed sample. Rotation speed of more than 1000 r/min produces welds with appropriate surface in CGPed (Constrained GroovePressing) samples. This may result from higher strength of CGPed that required higher heat input. The average grain size in the stir zone is finer than that in the base metal. This grain refinement during FSW process leads to greater hardness in the stir zone in comparison with hardness of Al base metal. Several forms of intermetallic compounds are found in weld zone of FSWed annealed and CGPed samples. These compounds mainly consist of Al2Cu and Al4Cu9 Dhancholia et al. [13] examined welding of AA 6061 and AA 7039Aluminum alloys. Welding speed and Rotational speed parameters are varied for the study whereas tensile strength, yield strength, hardness were measured.

Theweld produces at low speed have good mechanical properties than the weld produces at higher speed. The mechanical properties increase with the rotational speed and welding speed but up to a certain level then they start decreasing. Multi objective optimization using Response Surface Methodology (RSM) is used to optimize the friction stir welding parameters to obtain the optimum ultimate tensile strength, yield strength, hardness value and impact strength of dissimilar friction stir welded joint at 95% confidence level Palanivel et al. [14] studied effect of welding speed on mechanical and metallurgical properties of dissimilar welding of AA5083-H111 and AA6351-T6 aluminium alloys. Three kinds of microstructures have been observed, namely unmixed region, mechanically mixed region and mixed flow region. The fracture mode was observed to be a ductile fibrous fracture. In general; FSW at higher welding speeds results in a short exposure time in the weld area with insufficient heat and poor plastic flow of the metal and causes some voids like defects in the joint

CONCLUSIONS

In this paper a study of friction stir welding process has been done. It is revealed that FSW can be used to weld soft materials like aluminium, copper, nickel; titanium etc. successfully.FSW is significantly affected by various welding parameters like rotation speed, weld speed, axial load, and tool geometry etc. Table.1. shows summary of literature review of FSW process being applied to the soft materials. Based on review following conclusions has been drawn-. Hardness in weld zone is higher than heat affected zone due to the recrystallization of grains in weld zone. Ratio of shoulder diameter to pin diameter (D/d) plays an important role and contributes to the strength of weld. Increase in tool rotation and axial force resulted in increase in percentage elongation whereas increase in welding speed resulted in decrease of percentage elongation. Increase in rotational speed (RPM), Weld speed and axial load increases tensile strength up to a point further increase in rotational speed (RPM), Weld speed and axial load decreases the tensile strength. Water media reduces residual stresses in the nugget zone as compared to the normal FSW

Patil *et al*	AA6082-O	0.3Si2C0.3Mn12.1C	Triflute and Taper Screw threaded pin	Weld speed, Tool Pin Profile	Joints with taper screw thread pin exhibits superior tensile strength than tri-flute pin irrespective of welding speed
Koilraj *et al*	AA2219-T87, AA5083-H321	H13 with hardness 55VHN	Straight,Tapered,Threaded	RPM, Weld Speed, Pin Geometry, D/d	Cylindrical threaded tool profile found to be best during welding. D/d ratio played an important role and contributes to 60 % to the weld strength
Tutar *et al*	AA3003-H12	H13 hot work tool steel	Threaded Cylindrical Pin	Plunge depth, Dwell time, RPM	As plunge depth was increased; tensile shear load of fsw joint also increased with expansion of HAZ, TMAZ and SZ zones
Kumar *et al*	AA5083-O and AA6061-T6	-	Cylindrical	RPM, Weld Speed, Axial Force	Increase in RPM, axial load and welds speed increases tensile strength upto a point further decreases the tensile strength. Increase in tool rotation and axial force resulted in increase in percentage elongation whereas increase in welding speed resulted in decrease of percentage elongation.

Kadaganchi et al	AA2014-T6	H13 tool steel	Conical, Triangular, Square, Pentagonal, Hexagonal	RPM, Weld Speed, Tilt angle, Tool Pin Profile	Hexagonal tool profile produces higher pulsating effect and smooth material flow which resulted in improved mechanical Properties, whereas conical tool profile produced the lowest mechanical properties.
Barekatain et.al	AA 1050	H13 tool steel	Cylindrical	RPM, Weld Speed	Welding heat input caused grain growth and decrease in hardness value at Al side of the stir zone. It was found that, generally the weakest parts of weld joints of annealed and CGPed samples were Al base metal and stir zone, respectively. Further investigations showed that several forms of intermetallic compounds were produced.
Dhancholia et.al	AA 6061 and AA 7039	HSS tool	Cylindrical	RPM, Weld Speed	The weld produces at low speed have good mechanical properties than the weld produces at higherspeed. The mechanical properties increase with the rotational speedand welding speed but up to acertain level then they starts decreasing.
Palanivel et al	AA5083-H111, AA6351-T6	high carbon and high chromium steel (HCHCr) oil hardened	Straight square (SS) pin profile	Weld speed, RPM is constant	Lower welding speeds causeimproperconsolidation of material, which leads to the reduction in UTS owing to the defect. The stirring becomes insufficient at higher welding speeds. The material present in the advancing side of the tool does not travel enough to the retreating side, which causes adefect. The tendency of the tool to drag at higher welding speeds also contributes to the lowerUTS.

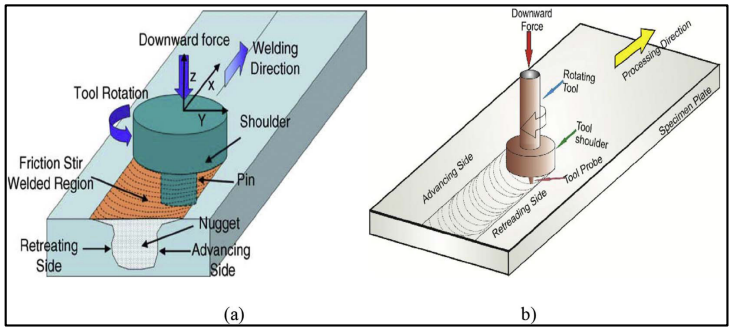

Fig. 1 properties such as tensile strength, yield strength, hardness, elongation etc can be improved

AUTHORS PROFILE

P.Suman received Masters in Mechanical Engineering from CENTURION University from odisha. He joined as faculty in Mechanical Engineering at JITM paralakhamundi Odisha India from 2013 to till date he has expertise in friction stir welding .he has been actively involved in various go-cart electrical bike racing events and attending various international conferences in Singapore ,Malaysia, Bangkok..

Dr. P. Srinivasa Rao is presently working in Centurion University as Professor in Mechanical engineering and DEAN of School of Engineering. Prior to this, he has worked in GITAM, GMR group's GMRIT and have total of 33 years of experience which include industrial, academic and applied research in engineering. He obtained his B. Tech from S.V. University, M. Tech from IIT, DELHI, Ph .D from Andhra University. His areas of interest are Manufacturing Technologies, metal matrix composites and Industrial engineering. He has published more than 80 articles in in International journals& International conferences of repute. Five scholars were awarded Doctoral degrees under his guidance and supervising 05 scholars for doctoral degree as on date. He has filed one Patent in vibratory welding system. He is professional member in Indian Institute of engineers [India][IEI], Indian society of nondestructive testing[ISNT], International Society for Research and Development[ISRD], Indian society of technical education[ISTE], International Association of Engineers[IAENG],Advances in Science ,Technology, Engineering Systems[ASTES].

Dr.D.SREERAMULU is presently working in Aditya Institute of Technology and Management as Professor in Mechanical engineering prior to this, he has worked in GIET, Centurion University and have total of 15 years of experience which include industrial, academic and applied research in engineering. He obtained his B. Tech from Andhra University, M. Tech from NIT, Warangal, Ph.D. from NIT, Warangal. He has published more than 50 articles in International journals& International conferences of repute.

ABSTRACT

Price remains constant over a period of time and fluctuates due to various reasons. The price floatation cause two types of economic conditions, one is Inflation and another is Deflation. Inflation may well be demarcated as increase in the general price level involve in the influences of production whereas deflation causes fall in the general price level. This study investigates the impact of inflation accounting application on companies' financial performance and financial position by analyzing financial ratios. The financial statements of 42 manufacturing companies covering 7 industrial sectors have been restated in current purchasing power for a period of 5 years (2004-05 to 2008-09). The ratios were calculated on both historical and adjusted numbers of financial statements to form two sets of ratios. In this study the Current Purchasing Power method, financial ratio analysis and different statistical tools like descriptive statistics and t-test have been employed to study the impact of inflation on major financial ratios. This study derived valuable information and results showed that with the impact of inflation, there is significant difference in liquidity, profitability and activity ratios.

Keywords: Manufacturing Firms, Financial Ratios, Inflation, descriptive Statistics, t-test

INTRODUCTION

Inflation continues to be an important reality of economic life in almost all countries. High inflation rates have seriously wind-swept monetary standards in these countries over the past few decades, and have brought forth new patterns of economic behavior. Despite of that, the effects of inflation on the financial performance of economic units go unrecognized in published financial statements. The primary purpose of the financial statements of a company is to give a true and fair picture of financial performance (i.e. profit or loss) of the company for a particular period and financial position (assets and liabilities) of the company for a particular point of time. Those transactions, which can be measured in terms of money, are taken into consideration for recording in the books of account. Money

Measurement Concept is a basic characteristic of accounting.

As per this accounting concept, only those business transactions which are capable of being expressed in terms of money are open for recording by the accounting system. It is also assumed that monetary unit, recording the business transactions, is stable in nature. However, price does not remain constant over a period of time. They tend to change due to various economic, social, political factors. Changes in the price level cause two types of economic conditions, one is Inflation and the other is Deflation. Inflation may be defined as period of general increase in the price level, whereas deflation causes fall in it. These changes in the price level lead to inaccurate presentation of financial statements which otherwise are prepared to present true and fair view of the company's financial health. Another point to consider for preparing the financial statements is the historical cost. In India the financial statements used to present according to actual and cost concept. But this Historical Cost Concept is based on the assumption that the unit of account, i.e. rupee has static value. Moreover, the purchasing power used to change by the passage of time and in India the purchasing power of the rupee is changing and it's rising continuously.

THE RESEARCH PROBLEM

In the past few years of high inflation, companies have reported very high profits on the one hand but on the other, they have faced real financial difficulties. This is so because in reality dividend and taxes have been paid out of capital due to overstated profits arrived by adopting the historical cost concept. This overstatement of profits can have several further effects. When these reported profits are used as the basis of corporate taxes to the Government, it leads to larger tax payments, and the Government becomes an important beneficiary of inflation. Furthermore, if reported profits are used as a basis of corporate decision making, the companies may not be setting prices sufficiently high to ensure an adequate rate of return on a long-term basis, if they have some scope for pricing policies. In addition, dividends are paid out to an excessive degree and thereby they have inadequate level of internal reserves to maintain their real resources intact.

The effect of inflation on the interpretative value of financial statements is much pronounced and it is more frequently put forward as an argument in favour of devaluation from the existing historical cost accounting' system. There are two important aspects of this problem worth monitoring. Firstly, during the period of prolonged inflation various items of the balance sheet, based on different levels of costs and prices, are not comparable in any real sense. In the Profits and Loss account, inventory profits and capital gains get inextricably mixed with operating profit thus making the proper assessment of the earning capacity of the firm difficult, if not impossible. In nutshell, the financial statements become difficult to interpret and their use as a tool of managerial decision-making is much lessened. Secondly, such financial statements mislead the shareholders and other users. The concept of 'profit' and 'maintenance of capital' based on the monetary postulates make the shareholders believe that so long as their money capital is maintained, their interest in the company are fully protected. This belief is, however, erroneous and quite misleading. The real interest of shareholders lies in the yield from business as a going concern and in the eventuality of its winding up in its actual break-up value as opposed to apparent book value. As a consequence of these interpretative difficulties, shareholders and other investors are not provided with information, which enables them to interpret the operating results and to judge the relative effect of price level changes upon a particular enterprise. Such inability arising due to interpretative difficulties of historical cost accounting to properly assess the business position may result in lost business opportunities.

Traditionally, historical cost based accounting information about the operations of companies has ignored the effects of inflation. But the users of financial information, such as current and potential investors, creditors, lenders, suppliers, customers, employees, government authorities and public, need relevant and reliable information about the financial position, performance and changes in the financial position of firms for making economic decisions. Inflation, on the other hand, distorts financial information by creating an impact on the firm's operational and financial results. In a hyperinflationary economy, reporting of operating results and financial position without

restatement is misleading and thus is not useful (International Accounting Standards 29, code 2). Therefore, it is necessary that financial statements reflect the true picture and are free from the negative effects of inflation. Even though inflation accounting has long been debated, a necessary attention is avoided to provide its effects on financial statements of businesses. Hence, this study is conducted to present empirical evidence on the results of inflation on financial statements through analysis of some major ratios. For the purpose, 10 ratios categorized under three groups are analyzed.

LITERATURE REVIEW

Gupta Ramesh and Bhandari L C (1978), in their working paper mention that the whether accountants should be required to adjust reported income for inflation. The objective of this article is to measure the impact of inflation on reported profits and relevant financial ratios. The earnings of 57 companies covering 9 industries have been restated for a period of 7 years (1970-1976). The results emphasize the differential effects on companies with varying inflation rates with general price level adjustments and the significance of monetary gains and losses. The effects of restatement on dividend coverage and tax burden have been suitably highlighted. D. J. Daly (1982), in the article "Inflation, Inflation Accounting and its Effect, Canadian Manufacturing, 1966-82", provides estimates of the effects of inflation in Canada on the reported rate of return in manufacturing firms from 1966 to 1982. It provides estimates for several different concepts of rate of return (both for all assets, whether financed by equity or debt, and for the narrower equity to the owners) and for both a narrow and wide range of financial assets. Comparisons are made with similar studies for the United Kingdom.

Shalom Hochman andOdedPalmon (1985) in their article "The Impact of inflation on the Aggregate Debt-Asset Ratio" demonstrate the impact of inflation on the aggregate debt-asset ratio cannot be determined theoretically. However, it is shown that inflation is likely to increase this ratio when personal income tax schedules are indexed to the price level and/or when leverage-related costs are relatively high and the personal tax rate on income from holding common stocks is relatively low. Whittington G., Saporta V andAjit Singh (1997), in their working paper"The Effects of Hyper-Inflation on Accounting Ratios Financing Corporate Growth in Industrial Economies" described the hyper-inflation can have a severe distortionary effect of the pattern of corporate finance which is apparent from company accounts. A simple algorithm, based upon the method of inflation accounting applied in Brazil, is developed and applied to the accounts of Turkish listed companies for the period 1982-90. The adjusted figures give a more plausible picture of corporate profitability and growth, and this suggests that the adjustment method is substantially successful.

Ambrish Gupta (2000), in his research entitled to "Inflation Accounting- The Indian Context", this study was a modest effort towards a systematic and comprehensive analysis of various aspects for inflation accounting and looks for offering an acceptable solution to this problem in the Indian context. It also made an assessment of the its effect of inflation on the profitability plus financial position, respectively, of the corporate entities, in addition to above it attempt to make an overall review of the financial statements, through ratio analysis and funds flow analysis, in the light of inflation. This study moreover reflects effects of inflation, over sixteen years between 1983-84 to 1998-99, on the financial health of Oil India Ltd. Karapinar A. andZaif F., (2005), in their article "EnflasyonMuhasebesininFinansalTablolarAnalizineEtkisi, (The Effect of Inflation Accounting on Financial Statement Analysis)" In their study, Karapinar and Zaif examined the effects of inflation on accounting practice of companies' financial ratios. Their sample covered the 73 non-financial companies listed Istanbul Stock Exchange as of 2003. The ratios were calculated on both historical and adjusted numbers of financial statements to form two sets of ratios. Results showed that there was no significant change in liquidity, financial, profitability and activity ratios except fixed asset turnover ratios.Akdoğan, Aktas and Unal, in their study in 2009, extended the number of companies in the sample of Karapınar and Zaif. The results covering 146 companies were consistent with the findings of Karapınar and Zaif's study. Their results revealed that a statistically significant change for the whole sample occurs only on Total Assets Turnover. Other ratios did not show any considerable difference.

Charles N'cho-Oguee, Daniel L. Blakley, L.William Murray, andMarolee Beaumont Smith (2011), in their article "Econometric Analysis of Functional Relationship between Inflation and Growth of Firms in South Africa: Empirical Research Findings" this research is to investigate the impact inflation and other factors on the growth of business firms operating in South Africa. Data sets of South African firms' financial statements over the period of 1983-1990 were assembled to permit a detailed examination of the impact of inflation on firm's financial ratios. It has concluded that firm's debt-to-equity, sales-to-assets, and profitability ratios are all positively associated with growth and adversely affected by high inflation; a firm's working capital-to-sales ratio is negatively related to growth and is positively affected by high inflation; and there is a real, measurable impact of the financial instabilities associated with apartheid on firm's growth. Aydın Karapinar, FigenZaifandRıdvanBayirli (2012), this study investigates the impact of inflation accounting application on key financial ratios. These studies related to the financial statements of 132 companies listed in the Istanbul Stock Exchange (ISE) are studied. An analysis of paired samples t test has been conducted on the financial ratios of the companies. The results showed that a significant difference between adjusted cost based financial ratios and historical cost based financial ratios occurs only for current, ratios, equity ratios and noncurrent turnover ratios. The study offered valuable information as to analyzing companies operating in hyperinflation economies. In India serious thinking on having to adjust historical cost accounts to price level change has been rather few and far between.

Patjoshi (2013),in the study investigated the comparison between reported and inflated financial ratios. Financial statements of 42 manufacturing companies covering 7 industrial sectors have been restated in current purchasing power for a period of 5 years (2004-05 to 2008-09). The ratios were calculated on both historical and adjusted financial statements to form two sets of ratios.Similarly, by considering the above data Patjoshi (2013) studied impact of inflation on reported financial performance: of Indian corporate sector,Patjoshi, (2013) examinedthe effect of inflation on measures of financial performance on Indian manufacturing industry, Patjoshi (2013) scrutinized impact of inflation on gross value added and net value added,Patjoshi (2014) observedimpact of inflation on corporate profitability and also Patjoshi (2016) observedimpact of inflation on major stakeholders. All the above studies used the Current Purchasing Power method and different tools of financial statement analysis like comparative and common-size statement analysis.

OBJECTIVES OF THE STUDY

The objectives of the proposed study are to find the impact of inflation on financial performance &position through analyzing the major financial ratios. The objectives of the proposed study are

a) To study the impact of inflation on short term solvency of sample companies through liquidity ratios.
b) To analysis the impact of inflation on financial performance of sample companies through profitability ratios.
c) To find out the impact of inflation on efficiency of resources employed by the sample companies through activity ratios.

HYPOTHESES FOR THE STUDY

To study the research problems and to attain the research objectives, three hypotheses have framed. Broadly, we have attempted to test the null hypothesis against the alternative hypothesis. The null hypothesis and the alternative hypothesis framed for the purpose are:

1. There is no significant difference in between reported and inflated liquidity ratios.
2. There is no significant difference in between reported and inflated profitability ratios.
3. There is no significant difference in between reported and inflated activity ratios.

METHODOLOGY AND TESTS USED IN THE STUDY

The work conducted is a study of 42 undertakings, selected randomly from manufacturing sectors operating in India. The companies so selected are capital intensive, where there is a heavy investment in fixed assets and inventories, profitable and following the same accounting practices throughout the period of study. These sample companies belong to different sectors, viz. Auto, Cement, Chemical, Fertilizer, Food, Petroleum and Steel.

The year-end financial statements of sample companies were used for the comparing the reported and inflated performances. The published annual reports, books, journals, web pages, etc. of the selected companies form the main sources of information. The data so collected are analyzed with the help Current Purchasing Power Method (CPP), Financial Statement Analysis (FSA) and Statistical tools such as; Average, Variance Standard Deviation, Kurtosis, Skewness, and t-test are employed too to draw meaningful conclusion. The t-test is used to compare the values of the means from two groups. The two sample of t-test has been performed because the variances of two groups are assumed to be unequal.

Current Purchasing Power Method

Current Purchasing Power Method of accounting requires the companies to maintain the financial statements on conventional historical cost basis, but it further requires presentation of supplementary statements in items of current purchasing power of currency at the end of the accounting period. In this method the various items of financial statements, i.e. balance sheet and profit and loss account are adjusted with the help of recognized general price index. The consumer price index or the wholesale price index prepared by the Reserve Bank of India can be taken for conversion of historical costs. However, WPI (All Commodities) is being used in this study,

Conversion Process

For analyzing the impact inflation on financial performance the Historical Cost Based (HCB) accounting, financial statements for all the years from 2004-05 to 2008-09 were converted into Accounting for Current Purchasing Power (CPP) financial statements in terms of the index number prevailing in the month of March 2009. The adjustments for inflation are based on movements in wholesale price indexhas presented in Table-1.
Source: Handbook of Statistics on Indian Economics: RBI, 2008-09 Sept15 2009, Office of Economic Advisor Ministry of Commerce and Industry.

The conversion process is explained hereunder

(a) All items of Profit &Loss Account, except Inventory Cost, Depreciation, Taxation, and Equity Dividend have been restated with reference to the "average price index of the year/period" as applicable to the individual year.
(b) Inventory cost has been restated after segregating opening balance of inventories, purchases of raw materials and closing balance of inventories as follows:
- Opening balance of inventories restated in previous year average price index.
- Closing inventories and purchases of raw materials restated in average year price index as applicable to the individual year.

(c) Fixed Assets and Depreciation cost of all the years of study has been adjusted to year base year 2000-01 at year end price index.
(d) Taxation, Dividend on equity shares have been restated with reference to the "end of the year/period index" as applicable to the individual year
(e) The CPP Method divides the Balance Sheet items into two categories: Monetary items and Non-monetary items. Monetary items are those assets and liabilities the amounts of which are fixed by contract or statute in

terms of the number of rupees irrespective of the changes in the purchasing power of rupee. Items which comes under monetary in nature are as follows:

- *Monetary assets* include Investments, which are fixed in rupees, Current Assets other than Inventories.
- *Monetary Liabilities* include Secured Loans, Unsecured Loans, Current Liabilities and Provisions Since the value of monetary items is fixed in rupees, they are already expressed in terms of current purchasing power of rupee and, therefore, need no restatement.

For Calculating purchasing power gain/loss, the balance of net monetary liabilities/assets as on the date of the Balance Sheet is bifurcated into opening balance and additions/decrements thereto during the year. The opening balance is restated with reference to the index prevalent on that date. Additions/decrements are restated with reference to the average index of the year. The closing balance is deducted from the total of restated opening balance and additions/decrements. The resultant figure, if positive, is gain otherwise loss in the case of net monetary liabilities and vice versa in the case of net monetary assets.

After converting the Historical Based financial statements into Current Purchasing Power, the major financial ratio has been calculated. The calculated ratios are presented in Table-2.

DATA ANALYSIS AND DISCUSSION

IMPACT OF INFLATION ON LIQUIDITY RATIOS

These ratios are calculated to comment upon the short-term paying capacity of a firm or a concern's ability to meet its current obligation. The important liquidity ratios are current ratio and quick ratio.

Statistical Outcome of Liquidity Ratios

Table-3 summarizes the results of Liquidity Ratios under HCB method as well as CPP method from 2004-05 to 2008-09 by the help of descriptive statistics and t-test.

Descriptive statistics and t-test for the current ratio provide that mean of reported current ratio is less as compared to that of the inflated; leading to the conclusion that liquidity position of sample companies is better under CPP method. On the contrary, lower standard deviation for reported current ratio as compared to inflated current ratio clearly indicates that former is more consistent than the latter. Even though value of kurtosis is found to be more than 3 under both the methods, it is higher in CPP as compared to HCB method. Therefore it can be concluded that the inflated current ratio is more peaked than that of the reported current ratio. Yet again, the correlation value is 0.9998 represents high degree of positive correlation between both the methods. The p-value of 0.0188, which is less than 0.05, indicates a significant difference in the value of current ratio between HCB and CPP methods at 5 percent level of significance.

Hence in the case of Current Ratio our hypothesis (H_{03}) is rejected as there is a significant difference between two accounting methods.. The Descriptive statistics and t-test analysis for the quick ratio in Table-3 reveals that the mean, standard deviation, kurtosis, skewness and all other findings are the same under both the accounting methods (HCB and CPP). It is because inventory is taken away from current assets for finding out the quick assets, the result indicates the reported and inflated quick ratios are identical.

IMPACT OF INFLATION ON PROFITABILITY RATIOS

This group of ratios measures the overall performance and effectiveness of the firm. The main profitability ratios include Gross Profit Margin, Operating Profit Margin, Net Profit Margin, Return on Investment and Dividend Payout Ratio etc.

Statistical Outcome of Profitability Ratios

Generally, profitability ratios measure the financial efficiency of firms in different ways. The descriptive statistics as well as results of t-test of profitability ratios viz. gross profit margin, operating profit margin, net profit margin and return on investment both under HCB and CPP methods from 2004-05 to 2008-09 is given below in Table -4.

The Table-4 clearly shows that mean value of gross profit margin is higher in the reported (HCB) method as compared to inflated (CPP) method for sample companies over the period of study (from 2004-05 to 2008-09), meaning thereby reported gross profit margin has performed better than inflated gross profit margin. But the HCB gross profit margin has more variation than that of the CPP, since both standard deviation as well as variance shows higher value in HCB method than CPP method. Though, the distribution of gross profit margin are found to be positively skewed in both the methods, the CPP gross profit margin is little bit higher skewed than that of the HCB gross profit margin. These ratios are observed to be platykurtic by nature i.e. it is more flat on HCB method. The p-value of 0.0024 in case of gross profit margin indicates significant difference in the absolute value of gross profit margin between reported and inflated at 5% degree of significance.

In case of operating profit margin, the mean value under CPP method is less than the HCB method, disclosing thereby operating profit margin has reported at a higher value in comparison to actual operating profit margin adjusted to inflation. The standard deviation of reported operating profit margin is less than inflated which reveals that there is less variation in reported operating profit margin in comparison to inflated. Skewness of operating profit margin found to be positive in case of HCB method, where as it is negative in case of CPP method. So HCB operating profit margin is positively skewed and for CPP it is negatively skewed. The p-value shows a significant difference between reported and inflated with respect to operating profit margin. The factors influencing the inflation were tested for the degree of relationship among them to find whether the fluctuation in one factor affects the other factors. To identify the same, the factors were measured for bi-variate correlation with respect to each other and their coefficients were given in the Table-4. From the Table-4, it is clear that there is a significant correlation existing between the factors of operating profit margin of reported and inflated.

Similarly, the mean of net profit margin is higher in case of HCB method as compared to CPP method. The variation of reported net profit margin is less than the inflated net profit margin as both standard deviation and variance is found to be less in HCB method. Here too there is a significant difference between reported and inflated net profit margin as the p-value is less than 0.05. However the skewness under both HCB and CPP method was found to be negative. So it can be said that net profit margins are negatively skewed. Net profit margins under both the methods experimented to be leptokurtic by nature i.e. they are peaked.

From the Table-4, it is evidenced that Return on Investment (ROI) has executed the same trend like that of gross profit margin, operating profit margin and net profit margin. The mean value and the standard deviation of Return on Investment (ROI) under HCB method is found higher than that of CPP method. Therefore there is less consistency in case of reported return on investment. The value of p shows that there is a significant difference between reported and inflated return on investment among the two accounting methods (HCB and CPP) for the study period. While in the case of skewness both reported and inflated return on investment are positively skewed and HCB return on investment is higher than the CPP return on investment. Both the reported and inflated returns on investment are leptokurtic by nature. The HCB return on investment is more peaked than the return on investment of CPP.

Table 4 shows the results of the profitability ratios, where it can be observed that the entire profitability ratios have dropped significantly. This shows that inflation adjustment leads to impact upon the shareholders' funds. The 3rd hypothesis does suggest no significant difference between the ratios of two groups (HCB and CPP). But the p-values of 0.0024, 0.0003, 0.0000 and 0.0006 respectively for gross profit margin, operating profit margin, net profit margin and return on investment shows that there is significant difference between reported and inflated profitability ratios. Therefore hypothesis (H_{03}): 'there is no significant difference in reported and inflated financial ratios' is rejected.

IMPACT OF INFLATION ON ACTIVITY RATIOS

Activity ratios are calculated to measure the efficiency with which the resources of a firm have been employed. These ratios are also called turnover ratios because they indicate the speed at which the assets are being turned over into sales.

Statistical Outcome of Activity Ratios

Activity ratio is a very important tool to measure the velocity of current assets of an organization and includes generally Creditor Turnover Ratio, Debtor Turnover Ratio and Inventory Turnover Ratio. The details of descriptive statistics and t-test of these ratios for sample companies under HCB method as well as CPP method are given away in Table -5 for the period under study.

It is observed from the Table -5 that the creditor turnover ratio has performed better in the case of CPP method as compared to HCB method, which indicates creditors are treated well in case of inflationary condition. The standard deviation as a measure of variation is found to be higher in CPP creditor turnover ratio than that of the HCB. Again, the creditor turnover ratio under both the methods is found to be positively skewed, but it is more skewed under CPP method than the HCB method. The ratio is experiential to be platykurtic by nature i.e. it is more flat in case of HCB method. As the p-value comes to 0.0000, so it is concluded that there is significant difference in creditor turnover ratio under both the accounting methods under discussion. Similarly, it is observed from the Table-5 that the mean value of debtor turnover ratio is superior under the CPP method as compared to that of HCB method but having more variations (as the standard deviation is found to be higher). Thus it can be said that inflation has favorable impact debtors of the sample companies during the period of study. Yet again the ratio is found to be positively skewed and leptokurtic under both the methods of accounting, but more skewed as well as more peaked under the HCB method than CPP. Like the creditor turnover ratio, there is significant difference in values of this ratio under both the accounting methods since value of p is found to zero.

On the contrary, The mean value, standard deviation as well as variance of inventory turnover ratio is found to be higher in HCB method as compared to the CPP method implying that the production efficiency of sample companies has suffered to greater extent due to inflation, but it is inconsistent during the period of study. Here also, like other turnover ratios, we found the inventory turnover ratio is positively skewed under both the methods and marginally more peaked under HCB method. There is also significant difference in values of inventory turnover ratio under both the accounting methods as evidenced from the p-value.

As the p-values for all three activity ratios (Creditor Turnover Ratio, Debtor Turnover Ratio and Inventory Turnover Ratio) are found to be equal (0.0000), there is a significant difference in between two accounting methods. For this reason hypothesis (H_{03}) for Activity Ratios is discarded.

CONCLUSION

From the above discussion and interpretation of the descriptive statistics and t-test of key financial ratios, undoubtedly it is observed that inflation has affected all the ratios under study except the quick ratio. With the

pressure of inflation the current ratio, creditor turnover ratio and debtor turnover ratio have changed and performed better, but no change has occurred to the quick ratio. Nevertheless all the profitability ratios and inventory turnover ratio have suffered badly due to the impact of inflation. The financial ratio analysis thus confirms that historical accounts overstate profitability and understate liquidity.From the above discussion, it is clear that due to inflation the profitability of sample companies has been understated, resulting additional payment of tax and dividend, but reduction in shareholders' funds by dropping retained earnings. Moreover, the dismal performance revealed under the CPP method points towards the efficiency of the management in fighting against inflation. Whatever view one takes, no one can deny that, but inflation has taken its toll. The reason for overstatement of corporate profitability under HCB method may be attributed to undervaluation of material cost and depreciation. The performance which otherwise appears to be quite good, turned out to be very dismal, when adjustments for current purchasing power of rupee are made. The CPP method adjustments have thus proved that historical profitability is a fairy story.

ABSTRACT

The primary focus of this review is to highlight the recent advances made in the field of nanotechnology. Essentially, it includes the green synthesis of metal nanoparticles (NPs), which has significant socio-economic benefits. Being an economically viable and bio friendly approach, green synthesis of nanoparticles is the need of the hour. Since time immemorial, plants are gifted with several phytochemicals like polyphenols, terpenes, sterols, carotenoids, vitamins and many more which have innumerable beneficial effects, one of which is their reducing attribute, resulting in the reduction of metal salts to their corresponding metal Nanoparticles (MNPs). Plant parts including bark, leaves, fruit, seed, root, flowers exhibit diverse medicinal potentials including anticancer, anti-inflammatory, antidiabetic, antioxidant, antibacterial and antifungal properties. The phytochemicals present are responsible for both preparation and stabilization of metal nano particles. These phytochemicals also act as capping agents to restrict the metal nano-particles for agglomeration which may produce less reactive big size metal nano particles. The prepared MNPs were examined by UV-Vis, FTIR, XRD,DLS,SEM, TEM, EDAX and Zeta potential analysis. In this preview, a comprehensive study on the preparation, characterization and antimicrobial activity has been portrayed. A detailed perspective of anti-microbial activity against several pathogens is also outlined. This study can be a stepping stone for developing novel NPs.

Keywords: Nanoparticles,Green synthesis, anti-inflammatory, Anti-microbial study

INTRODUCTION

From last few decades different valuable applications in different field of science have been found in nanoscience and different branches of scientific research are undertaken in this field of science. The word "Nano" came from the Latin word nanus means dwarf with particle size of 10^{-9}meters. The size of nanomaterial are between molecular &

macroscopic dimensions. i.e. greater than 1nm and less than 100nm.Different interdisciplinary applications were discovered by advance scientific research on nano-sciencelikeapplication in the field of data storage, biomedicine, catalysis, energy technology, magnetic and fuel cells. Due to the vast application of nanotechnology it received growing interest in this century. Nanoparticles (NPs) are minute particles with dimension lies below 100 nm (1 nm = 10^{-9} m). They possess excellent physical, chemical and biological properties which make them special in the field of materials science and biology. The synthesis, study and applications of various NPs are highly essential in science & engineering. Based on the size, morphology, physical and chemical properties these have different application mainly in the field of medicine or therapy. The conventional synthesis of MNPs have various risks to the environmentby consuming chemicals and by liberating hazardous chemicals or gases to the environment. The physical route involves high energy consumption and the chemical route generally involves use of toxic chemicals & release of hazardous byproducts.So green synthesis or bio-synthesis isan excellent alternative route for the synthesis of nano-samples by overcoming the drawbacks of physical & chemical methods. The recent introduction of biological methods involves microorganisms, algae, or plants at ambient temperature and pressure in a bio-friendly manner. Out of these green synthesis routes, the use of plants and its different parts have proved most convenient and economic. The phyto-chemicals containing different bio-molecules present in extracts of different parts of plant are responsible for the reduction of positively charged metal ions into atomic or nano form (in nano size) which are helpful in stabilizing the synthesized aggregateatoms before the production of nano scale particles.

Because of unique properties of NPs like large surface area,adsorption, quantum and releasing properties, the NPshave showed a great potential in interdisciplinary applications. NPs are broadly classified as carbon-based NPs (Graphene, fullerenes carbon nanotubes etc.), ceramic NPs (SiC, BN, Al_2O_3, etc.), metal NPs (e.g., gold, silver, platinum, copper, etc.), oxide NPs (e.g., Cuprous oxide Cu_2O, Zinc Oxide ZnO, Titanium oxide TiO_2, etc.), semiconductor NPs (e.g., GaP, GaAs, GaN etc.) etc. The size, morphology, dispersibility and physicochemical properties of MNPs are depends on its synthesized routes which in-turn depends on its different interdisciplinary applications.Thus, the main objective of recent MNPs research is to find host which may control the properties of MNPs.

According to Hett, (2004) Nanoparticles are classified into three categories. Such as One, two& three dimension. One dimension or primary NPs are surfaces or thin film which is used in engineering electronics and chemistry. Thin films are recently used in Solar panels or solar cells or used as catalyst. Secondary or two dimensionalNPsmainly includes Carbon nano-tubes (CNTs). These have hexagonal structure with diameter of 1 nm and length of 100 nm.These are of two types. (a) single-walled carbon nano-tubes (SWCNTs) and (b) multi-walled carbon nanotubes (MWCNTs). Kohler et al., 2004 reported the unique properties of CNTs like physical, mechanical and electrical properties which make them chemically very stable.The best example of tertiary or three dimensionalNPsis Fullerenes (C_{60}).These have 28 to more than 100 carbon atoms connected through a pentagon or a hexagon resembles a spherical cage or a soccer. These have unique physical & chemical properties.It is used in solar cells for data storage.Tomalia, 2004 have reported the presence of large empty spaces for guest bio-active molecules which may show significant medical applications.

Preparation of Metal Nano Particles (MNPs)

The physical, chemical and biological properties of nanoparticles with size,structure depends on its synthesis method.The various factors which affect the particle size, chemical composition, crystallinity and shape are pH, concentration of precursor salt solution, temperature, concentration of capping agent, sonication conditions, etc. Various shapes of MNPs are reported & characterized like nano cubes, nano triangles, nano tetrapods, nano stars, nano cluster, nano branch, nano rod, nano sphere, nano wire, nano tripod, nano prism, nano disks, nano shells, nano frames. Therefore, the selection of preparatory route & condition are important in preparation of desired nanoparticles.

The two basic routes employed to prepare NPs are: (1) Top-down methodand (2) Bottom-up method1. In the top-down method, NPs are obtained by mechanical crushing of source material. Some examples are high energy ball milling, laser ablation, electro-explosion, chemical etching, etc. In the bottom-up method, by chemical or physical process new structures are built up . Here NPs are obtained as aaddition of atom to atom or molecule to molecule addition. This route is based on physio-chemical principles which follow atomic or molecular self-organization. Some of the examples of this route are sol-gel process, green synthesis, chemical reduction method, hydrothermal route, chemical vapours deposition (CVD), combustion, aerosol process, plasma spraying process, etc.

Green synthesis of noble metal NPs & its Characterization- review

The use of chemical & physical methods for the synthesis of MNPs leads to high energy consumption or use of toxic chemicals or generation of hazardous by-products. In chemical method, the toxic capping agents present do not show any biomedical applications. Alternatively, use of bio-synthesis routein spontaneous condition and nontoxic environment can maintain ecological integrity & eliminate the drawbacks of conventional approaches.

The various common conventional routes mentioned earlier in synthesis of NPs utilize toxic chemicals which are not environmental benign. So, now-a-days researches in the field of biology, chemistry, and materials science are adopting bio-directed synthesis (also known as green synthesis) of NPs. Biosynthesis of MNPs is an eco-friendly route which avoid utilization of hazardous, carcinogenic, harsh chemicals. The various biological methods employ micro-organisms (algae, bacteria, fungi, yeast, etc.) and various plant parts in synthesis of NPs. As plant mediated synthesis is cost effective, it is widely used in these days for macro scale synthesis of MNPs. Also the various phyto-chemicals present in plant extracts are acts as both reducing and stabilizing agent in developing MNPs.

Abbasi et al.[1] have synthesized spherical Gold nanoparticles (GNPs) of well defined morphology from aqueous extract of *guduchi (Tinosporacordifolia)*. Depending upon the ratio of extract concentration and metal solution, two types of the surface plasmon resonance (SPR) band was found to be under UV-Spectra. first peak as a single peak in the visible region with λ_{max} 551 nm , and the second peak as a double was found as two peaks with λ_{max} at ca. 555 and 980 nm.Due to presence of aliphatic nitro group , a strong absorption band was obtained under FTIR spectra. In XRD study, the structure of Gold nanoparticles (GNPs)was found to be Face Centred Cubic with crystallite size ranging from 22.3 to 51.4 nm. SEM and HR- SEM predicted the Au NPS were of spherical shape having size ranges from 16–30 nm& 25–75 nm both thecombination.From EDX spectra it was revealed a strong band showing thepresence of Gold nanoparticles (GNPs).Huang et al.[2] have used an aqueous chitosan extract (100% deacetylated, Fluka). for the preparation of MNPs (Gold and Silver). Here Polysaccharides acts as reducing & stabilizing agents. The SPR band was found to be 522nmindicates the presence of Gold nanoparticles (GNPs). TEM image confirms isotropic nature of synthesized particles.

UjjwalaGaware et al.[3] have synthesized GNPsby using an aqueous solution of Piper betleleaves. By UV-Visible characterization it is seen that the Surface Plasmon bandλ_{max} at 551nm which intensity increases steadily which indicates the presence of spherical GNPs .There was found a reduced absorption band in FTIR spectra which revealed the interaction of phyto-chemical present as aldehydes orketones with the Gold nanoparticle . From XRD analysis indicates the Au NPs having fcc structure & crystalline in nature.The triangular shape of GNPs was confirmed by TEM with edge-length660nm to 1000nm. "Lightning-rod effect" indicates the presence of MNPs with anisotropic properties. Yong Song et al.[4] have reported the synthesis of GNPs from Diopyros kaki and Magnolia Kobus with variation in temperature. There is no significant change in FTIR spectra was observed before and after the bio-reduction inMagnolia Kobus leaf extract. Thepresence of multiple functional groups in Kobus is responsible for the synthesis of GNPs. TEM images shows a mixture of plate (triangles, pentagons, and hexagons). With increase in concentration of leaf extract, the particle size of GNPs increases. With rise in temperature, the particle size decreases i.e. at 25 ^{0}C the particle size was found to be 110nm but at 95 ^{0}C it was found to be 40nm. From Atomic Force Microscope (AFM) study it was revealed that, the synthesized GNPs showing structure like nanoplates having

width of 250–300 nm and thickness of 5-7nm in 5% Magnolia leaf broth at 25^{0}C. EDX spectra it was revealed a strong band showing the presence of GNPs. XPS spectrum revealedsynthesis of GNPs by bio-synthesis using plant leave extract.

Shiying He et al.[5] have utilized Microorganisms and Culture Conditions for the synthesis of Gold nanoparticles (GNPs).Amixed culture of Rhodopseudomonascapsulatain a medium withyeast, pyruvate, extract, NaCl, NH_4Cl, and K_2HPO_4 at pH 7 and 30 °C are used for the synthesis purpose of Gold nanoparticles (GNPs) .The SPR band with a strong absorption of 530nm confirmed from UV-Visible spectra. The GNPs are found to be isotropic and uniform size.From the FTIR spectrum, band at 1640 and 1540 cm^{-1} indicates the presence of amide and band at 1450 cm^{-1} showing the presence of methylene scissoring vibrations in proteins. The synthesized GNPs were stabilized by binding of amine or cysteine residue part of protein. From TEM image the size of synthesized GNPs ranging 10-20 nm qt lower concentration of auric acid solution i.e. concentration of 2.5 $x10^{-4}$ M and from selected area electron diffraction (SAED) pattern by TEM pattern the synthesized GNPs were shown. From XRD analysis a characteristicpattern of face-centred cubic (fcc) was obtained for synthesized GNPs by using Scherrer equation. From EDAX spectrum, astrong signals confirms the presence of Gold nanoparticles (GNPs). Das et al.[6] have utilized alcoholic (ethanol extract) of Centellaasiatica leaves for the synthesis of GNPs of well-defined size and distinct morphology. Thephyto-chemical present in the extract with high phenolic content with anti-oxidant nature help in reduction of Gold salt GNPs. The synthesised NPs were characterized using UV–visible spectra with SPR band at 534nm, Ultra High Resolution Transmission Electron Microscopy (UHR-TEM) shows formation of spherical NP, Fourier Transform Infrared (FTIR) spectrophotometer shows the distinguished interaction between Gold salt and phyto-chemical present in plant extract. X-ray diffraction (XRD)revealed the synthesized Gold nanoparticles (GNPs) have face centred cubic (FCC) array of crystal.

Isaac et al.[7] have used fruit extract of Averrhoabilimbi Linn for the synthesis of GNPs and Silver nanoparticles (SNPs).UV-Visible spectra showed SPR band at 540nm for GNPs and 420nm for SNPs. FTIR spectra revealed characteristic strong absorption bands which confirmed the interaction between metal salt and phyto-chemical present in the extract. The C–OH stretching of primary alcohols, the silver showed bands at 3285, 1633, and 1025 cm^{-1} assigned to O–H stretching vibration of alcohols and phenols, C=O stretching vibration of Tertiary amides, and C–OH stretching of primary alcohols. Scanning Electron Microscope (SEM) confirms the presence of anisotropic MNPs (i.e., cubic, hexagonal, pentagonal, etc.). Patra et al.[8] have reported synthesis of GNPs from the water extract of watermelon grid and evaluated their antioxidant and antibacterial effects.They reported that synthesized GNPs have significant antibacterial potential against five foodborne pathogens (i.e.Bacillus cereus, Escherichia coli, Listeria monocytogenes, Staphylococcus aureus, Salmonella typhimurium.). The Au nano colloids exhibited high synergistic activity against the standard antibiotics like rifampicin & kanamycin. The synthesized GNPs have considerable anti-proteasome, antioxidant and inhibitory potential against standard antioxidant. They analyzed the effect of reducing and stabilizing character of phytochemicals present in the extract using FTIR. To confirm the formation of Gold nanoparticles (GNPs), they took the help of results obtained from Ultra Violet–Visible spectra, SEM and EDAX plot. Kumar et al.[9] have reported synthesis of GNPs using extract Zingiberofficinale. The size of the synthesized GNPs was 5-15 nm. Due to its physiological stability and active good blood biocompatibility, these may be used in medical applications. The synthesis of GNPs with size distribution wasconfirmed by using dynamic light scattering DLS, UV–Visible spectrophotometer and TEM. Islam NU et al.[10]utilized galls extract of Pistaciaintegerrima for the synthesis of GNPs. The prepared AuNPs reported to exhibit good antifungal activity and possessed superior muscle relaxant property. Kumar et al.[11] have preparedSNPs) by using finely grounded powder of Mimusopselengifruit extract in water. The synthesized samples were characterized by using different spectroscopies (UV-Visible, FTIR and TEM). The synthesized SNPs have significant antibacterial and antioxidant properties against Escherichia coli (E. coli) &Staphylococcus aureus (S. Aureus) pathogens. Also the synthesized SNPs are reported to act as good antioxidant against ascorbic acid.

Majumdar et al.[12] have reported the synthesis of colloidal GNPs by using aqueous bark extract of Mimusopselengi. The characterization of synthesized colloidal GNPs were done by using UV-Vis, TEM, and X-ray diffraction (XRD). From the UV-visible spectra, the synthesized GNPs have SPR band between 536nm to 541 nm and spherical shape. The XRD analysisconfirmed the presence of GNPs with face-cantered cubic (FCC) array pattern. They reported the phyto-chemical present as poly-phenols in the extract showed both reducing as well as stabilizing properties confirmed from FTIT studies.J. Kasthuria et al.[13]revealed green synthesis of GNPs and SNPs utilizing apiin. They reported apiin has reducing character which helps in synthesis of MNPswith varying concentration of apiin extract. From UV-Visible spectra, a well separated two SPR bands were obtained at 540nm (spherical) and 950nm (plannar). For SNPs SPR band is at the 456nm. The FTIR analysis shows bio-reduction of metal salts ($AgNO_3$ and $HAuCl_4$) with phyto-chemical present in the extract. The lower frequency shift in GNP) revealed the effective adsorption of apiin extract on GNPs than SNPs. TEM image reported maximum presence of spherical particles than triangular ones. The presence of different sized nanoparticles were 7.5nm range (30%) and 12.5nm range (54%) range and 23 nm ranges(12 %) and 65nm (small %). XRD analysis of the synthesized Gold nanoparticles(GNPs)from apiin extract was found to have Face Centred Cubic(FCC) pattern. The single crystallinity of the synthesized particles was confirmed from selected-area electron diffraction (SAED). The average size of the synthesized GNPs was 39 nm with quasi-spherical shape.The presence of water molecules in the synthesized MNPs was confirmed by TGA analysis with a steady loss of weight until 800°C.

Fakayode et al.[14] have reported the synthesis of Noble Metal Nanostructures by using non-polysaccharide reductants like Sodium citrate, Sodium Borohydride ($NaBH_4$), Tetrakis (Hydroxymethyl) Phosphonium Chloride (THPC) &polysaccharide reductants like Starch, Cellulose, Dextran. The absorption peak of SPR band from UV-spectra was 520nm for GNPs and 400nm for Silver nanoparticles (SNPs). From FTIR data analysis, the interaction between polysaccharide and GNPs or SNPs was confirmed by wave-number absorption bands. From zeta potential data it was confirmed that the synthesized gold and silver NPs were surrounded by negative charges. The positively charged polysaccharide based gold and silver nanoparticles were stabilized by electrostatic repulsion of the polysaccharide's molecules. Dynamic Light Scattering data revealed that size of the synthesized gold and silver nanoparticles decreases with concentration rise of polysaccharide to a certain extentand due to aggregation it increases further at high concentration. The synthesized NPs are characterized using TEM, SEM and XRD. The synthesized sample containingGNPs are used in medical applicationlike plasmonic bio-sensing detection, bio-imaging, fluorescence detection, Photo-thermal Therapy and the synthesized sample containing SNPs are used in medical application like Diagnostic enhancement, Targeted antimicrobial activity, Anti-angiogenesis activity.

Dubeya et al.[15]synthesized colloids of gold and silver by utilizing aqueous leaf extract of Sorbusaucuparia. From UV–vis spectra, the SPR band was found to be 300-1000nm for GNPs and 400-1000nm for 400nm for SNPs which is confirmed by the colour change from brown–yellow for silver and pink–red for gold. TEM images analysis revealed that the particle size was 50-100nm for Silver and 50-150nm for GNPs of nanoparticles at 10^{-2}, 10^{-3} and 10^{-4}M concentration of SNPs. Zeta potential value rises with increase in pH of the solution for Silver but samples with gold solutionhad no effect of change in p^H on zeta potential value. Both synthesized nanoparticles have negative zeta potential value over a wide range of p^H. FromPowder XRDdata it was revealed that both Gold and Silver samples have FCC crystal array. The presence of Gold and silver was confirmed by EDX study. FTIR absorption band indicates theinteraction and stabilization of bio-synthesized MNPs.

Faramarzia et al.[16]synthesizedGNPs utilizingaqueous extract of laccase from Paraconiothyriumvariabile. Laccase of P. variabile is purified, assayed & the temperature stability is determined by incubating at different temperatures. By increasing the concentration of Chloroauricacid, increases the absorbance to 520 nm.The best result of size range between 71-266nm was found at 70 ^{0}C after incubation time of 20minutes. From FTIR analysis, two major absorption peaks were obtained which corresponded to alcohol or amine or carbonyl functional groups present as phyto-chemical. The data from SEM, TEM and EDX confirmed the presence of GNPs.Shih et al.[17]reported the synthesis of GNPs using alkaline solution of chitosan. The synthesized samples were studied under different spectroscopic

techniques. They reported the decrease in synthesized particle size with respect to concentration change of polysaccharide. Sunet al.[18] synthesizedGNPs using biopolymer in acidic medium in presence of chitosan. The mechanism of formation of nanoparticles is reduction to open chain. The applicability of chitosan in preparation of GNPs was studied and by peptide synthesis and protein many preparatory ways have been developed.

Khalil et al.[19]have demonstrated bio-synthesis of GNPs fromaquousleaf extract ofOlive. From UV-Spectra, SPR absorption band was545 to 530 nm. Photoluminescence studies revealed emission at 425nm at an excitation of 350nm. The TEM image revealed that formation of triangular shaped GNPs with diameter of 50 -100 nm. The FTIR study showed the probability of binding of synthesizedGNPs with antioxidant group or protein present in extract as phyto-chemical. X-ray diffraction study revealed the presence of crystalline GNPs were identical with blue shift spectra at basic pH of 9.6. pseudo-spherical shaped GNPs were seen at higher extract concentration and p^H. The synthesized GNPs were well interacted and stabilized or capped by phyto-chemicals present in extract. The synthesized samples have many bio-medical applications because no toxic reagents had been used in synthesis. Daizy Philip[20] has reported biosynthesis of GNPs & SNPs using aqueous extract of Mushroom. UV absorbance spectra showed SPR band at 545nm for the gold colloids with size of the NPs range from 20 to 150 nm. With excess of the NPs there is formation of spherical shaped NPs by agglomeration. FTIR studies revealed that the interaction between bio-molecules as phyto-chemical present in extract and metal salt which may acts as both stabilizing and capping agent. Due to this the surface of the GNPs prevents the sintering of nascent gold nano-crystals. The SPR band from UV–vis spectra of silver colloids was found at 413 nm. The XRD study confirmed the crystalline structure of gold nanoparticles. Photoluminescencespectra showed emission at 300nm of the synthesized GNPs at an excitation of 300 nm.

The study reported by B.Ankamwar[21] is synthesis of GNPs using aqueous extract of Terminalia catappaleaves. The SPR absorbance band from UV-spectra was found to be at 524nm. FTIR spectra indicate the possible interaction between bio-molecules in the leaf extractand the Gold salt & the stabilization of synthesized GNPs was due to phyto-chemical and capping agents present in the extract. TEM image showed synthesized GNPs were spherical in shape with size of 10 - 35 nm at an average size of 21.9 nm.XRD analysis showed the synthesized Au NPs have FCC structure & the antimicrobial, antioxidant properties have application in cancer therapy. Inbakandana et al.[22] reported synthesis of GNPs utilizing marine sponge Acanthella elongate. The SPR band was appeared at 526nm. TEM image indicates the synthesized GNPs were seen as poly-dispersed with spherical shape with size range of 7 to 20 nm. FTIR data showed strong absorption band by the interaction of phyto-chemical with metal salt solution.

Sastry et al.[23] have reported biosynthesis of metal nanoparticles (both Gold and Silver)using fungi and actinomycete. The synthesized SNPs were prepared by intracellular synthesis by using Verticilliumsp.(from the Taxusplant)base of potato-dextrose agar slants at 25°C. TEM images of reported the particle diameter of 25 ± 12 nm.GNPs undergo extracellular synthesis byactinomycete, Thermomonospora sp. with a much improved polydispersity.UV-Visible spectra revealed SPR band at 520 nm. FTIR spectrum recorded two strong absorption bands 1660 and 1530 cm^{-1}. TEM images showed that the synthesized GNPs have spherical shape with average size of 8nm. The Synthesized GNPs are mono-dispersing in nature. Huang et al.[24]synthesized GNPs and SNPs by using leaf extract of Cinnamomumcamphora. The leaf extract were sun dried and novel in nature and commercially available noble metal salts ($AgNO_3$ and $HAuCl_4$) were used for the synthesis of MNPs. From UV-Visible studies the SPR band was at 570 nm & 440nm for Au & Ag NPs respectively. The poly-dispersity of the synthesized MNPs was confirmed by TEM image. TEM image also revealed the anisotropic nanostructures of synthesized MNPs. The crystalline nature of synthesized MNPs was confirmed by XRD studies. A.Thirumurugan et al.[25] have reported biotechnological preparation of GNPs utilizing aqueous extract of Azadirachta indica leaves. The SPR band was at 550nm by using UV-Visible spectra.

Badri Narayanan et al.[26] have reported synthesis of GNPs by using aqueous extract of Coriander leaf. The SPR band was at 541nm by using UV-Visible spectra. XRD analysis reflects FCC structure of gold nanoparticles & by using

Bragg's equation the size was found to be 15nm. A strong peak of Gold atoms from EDAX studies confirms the presence ofGNPs and a weak signal of carbon atoms may arise from X-ray emission of proteins or enzymes present in vicinity of the GNPs. FTIR spectra showed a strong absorption bands corresponds to C–N stretching vibrations of amine. HRTEM studies revealed that the synthesized GNP have spherical, decahedral, triangle and truncated triangles shape with size ranging from 6.75 nm to 57.91 nmwith an average size of 20.65±7.09 nm. Philip et al.[27] have presented extracellular biosynthesis of GNPs and SNPs using aqueous extract of Krishna Tulsi (Ocimum sanctum) and Auric Chloride& Silver nitratehe SPR band for GNPs and SNPs were at 545nm and 426nm. TEM images showed the synthesized GNPs have hexagonal shape with average size of 30nm and the synthesized SNPs were spherical shape with particles size of 13nm. XRD analysis showed both GNPs& SNPs were having FCC lattice array. The crystalline nature of GNPs was confirmed by Selected area electron diffraction (SAED) pattern. Strong absorption bands in FTIR spectra revealed the presence of biomolecules as phytochemicals are responsible for the stabilization and capping of synthesized MNPs.

Kumara et al.[28] have reported facile bio-synthesis of GNPs using aqueous leaf extract of Cassia auriculata. The leave of Cassia auriculata has antidiabetic potential. The SPR band was at 536nm by using UV-Visible spectra. From FTIR spectra the strong interaction between GNPs and bio-molecules present in the extract was established. TEM image showed the shape of GNPs were spherical, hexagonal and triangular in shape with size range of 15–25 nm in size. XRD analysis reflects FCClattice array of synthesized GNPs. SEM image revealed the synthesized GNPs were aggregated with size range of 15–25 nm .Chen Wu et al.[29] have presentedgreen-synthesis of GNPsusing aqueous solution of Gum Arabic. The extract is both acts as reducing and a stabilizing agent. UV-Visible spectra revealed a characteristicSPRband at 534.5-532.5nm. The TEM image reflects the non-agglomeration of GNPs may be due to presence of phyto-chemical in Gum Arabic extract with a size range of 21.1±4.6nm. From DLS studies the mean hydrodynamic diameter was found to be 26.8±5.3 nm. XRD analysis showed the synthesized GNPshave FCC array of lattice .With the variation Temperature and concentration of both Gold solution & the type of GNPs synthesis were different.

Daizy Philip[30] has reported synthesis of GNPs and SNPs by using aqueous extract of Hibiscus rosasinensis and Auric chloride & Silver nitrate at different concentration with p^H change. The shape of the Silver nanoparticles changes with change in p^H of the medium. The SPR band for GNPs was 576nm& for SNPs it was 413nm. TheTEM studies revealed the synthesized GNPs were spherical in shape and anisotropic. Theparticlesarealmostsphericalwithsize of14 nm.XRD analysis confirmed the GNPs have FCC lattice array with particle size of 13nm. Similarly,SNPs also have FCC lattice array. FTIR spectral studies showed the GNPs were stabilized by amine group present in extract as phytochemical and SNPs werestabilized by carboxylate ion present as phytochemical. Dubeya et al.[31] have prepared biotechnologically Gold and Silver nanoparticles utilizing aqueous leaf extract of Rosa rugosa. The UV-Visible spectra revealed that the SPR absorption band for GNPs was 578nm and for SNPs was 451nm with colour change frompink-red colour and brown-yellow respectively. TEM images study confirmed both the synthesized MNPs were spherical in shape with particle size of 30–60 and 50–250nm in case of SNPs and GNPs. Zeta Potential data showed that the synthesized MNps were stable in a pH range of 2-10 and the negative zeta potential value increases with increase in pH.The average crystal size of SNPs and GNPs were 12nm and 11nm revealed from Powder X-ray diffraction studies by Scherrer equation. FTIR spectra revealed the interaction and stabilization of synthesized MNPs with phyto-chemical present in extract.

Honey mediated green synthesis of GNPsby Daizy Philip[32] in his another paper reported the synthesis of GNPs using diluted solution of honey. The fructose and monosaccharidepresent in honey acts as reducing agent for the reduction of metal salt to metal atoms or nanoparticles. From UV-Visible spectra the SPR band of Au NPs was 576nm with characteristic of spherical particles. TEM studies showed that the synthesized GNPs are spherical in shape with average size of 15nm. Selected area electron diffraction (SAED) pattern revealed the synthesized GNPs have crystalline nature. XRD analysis revealed the FCC array of lattice with average size of 15nm by using Scherrer equation. There was no sintering of nascent Gold atoms because of strong interaction between biomolecule as

phytochemical in extract and GNPs.FTIR spectra revealed the presence of phyto-chemicals in extract have strong interaction with the synthesized GNPs which acts as both stabilizing and capping agent. Photo-luminescence spectral data showed emission spectra at around 447 nm. The synthesized GNPssamples have significant therapeutic applications.

Nora Elizondo et al.[33] have reported polyol method of synthesis of MNPs (GNPs and SNPs) using ethylene glycol as solvent redactor by using poly(vinylpyrrolidone) (PVP),Auric acid ($HAuCl_4$) (III) hydrate,Silver nitrate ($AgNO_3$) and poly (N-vinyl-2-pyrrolidone) (PVP) by use of plants like Cucurbita Digitata , Aloe Barbadensis, Rosa Berberifolia and Geranium Maculatum,. The prepared ascorbic acid from the above process acts as reducing agent. The Uv-Visible spectral data revealed that the SPR absorption band at 547nm for GNPs and 417nm for SNPs. TEM image revealed that the Spherical NPs with particle size of 29-120nm for GNPs and 10-27nm for SNPs. From precursor injection method, the synthesized silver nanoparticles(SNPs) have a uniform size of 25 ± 4 nm with high monodispersed. From Near field Scanning Optical Microscope (NSOM)studies revealed that the synthesized GNPs have a particle size of 25 nm with narrow distribution. The XRD analysis data (D-value, k= 0.90) calculated from reflection of cubic phase of Gold tally with TEM image data i.e.25nm.The spherical and quasi-spherical and monodisperse SNPs were obtained from $AgNO_3$ with Aloe Barbadensis. 4nm size of GNPs were synthesized with glycolextracts of CucúrbitaDigitata. GNPs with anisotropic nature and SNPs with spherical or quasi-spherical shape were synthesized by the reaction of Auric acid with aqueous extract of Aloe Barbadensisat 60°C and silver nitrate.

Narayanan et al.[34] have followed phytosynthesis method for the synthesis of GNPs following dilutedleaf extract of Coleus amboinicus Lour. This process of synthesis is more convenient and acceptable as microbial method is more tedious and time consuming. The UV-Visible data revealed that the SPR absorption band was 536 nm. From XRD studies, the synthesized GNPs have spherical shape with an average size of 23.7±0.72 nm and with a magnification of x23k, the average size was found to be 50-80nm. A strong peak in spot-profile EDAX revealed the presence of Gold atoms with a weak signal of carbon. FTIR data showed interaction between biomolecules present in extract with metal salt by showing a strong absorption peak. The shape of the synthesized GNPs were spherical, triangle, truncated triangle, hexagonal and decahedralwith an average size of .5±11.45 nm at a magnification of ×50 k.

MubarakAli et al.[35] have attemptedeco-friendly synthesis method for the synthesis of MNPs (GNPs and SNPs) utilizingdiluted water extract of Menthapiperitaleaves. UV-Visible data showed the SPR absorption peak at 450 nm & 530 nm for SNPs and GNPs respectively. From FTIR studies it was confirmed that the presence of bio-reducing groups as phyto-chemical in the extract responsible for the reduction of metal salt ($AgNO_3$ and $HAuCl_4$) and stabilizing with capping of synthesized nanoparticles. A broad peak at 3394cm−1 wasrevealed the presence of N–H group from any peptide bond linkage. SEM image confirmed that the synthesized MNPs (GNPs and SNPs) are spherical in shape. The average size of GNPs were150 nm. The elemental metal signal of Silver and Gold was confirmed from Energy dispersive spectroscopy (EDS) studies. The Synthesized samples having SNPs have considerable antibacterial effect on pathogen E. coli thanS. Aureus. This may be due to different cell wall composition of positive gram and negative gram (E. coli) pathogens. On the other hand,the synthesized samples having GNPs have antibacterial effect on E. coli not in S. Aureus. Whereas the plant extract has no antibacterial property. Ghosh et al.[36] have utilized the aqueous extract of *DioscoreabulbiferaTuber* for the synthesis of GNPs with anisotropy properties. The SPR peak was 540nm revealed from UV-Visible spectra. Field emission scanning electron microscope-energy dispersive spectrum (FSEM-EDS) studies revealed the shape of synthesized GNPs werespherical with diameter of 11-30nm and size of 17-18nm. Different shapes with size have been predicted form the data asnanotriangle with equilateral edges with length 270 nm approx., the average size of 207nm and the average size of trapezoids was 300 nm. The EDX studies revealed that the strong signal of gold indicates the presence of atomic gold. XRD spectra revealed the synthesized GNPs have FCC lattice array with a crystallite size of ~13 nm. FTIR spectral analysis showed interaction between phytochemical present in extract and used noble metal salt solution with strong absorption bands.

Sharma et al.[37] have synthesized GNPs fromSeeds of Sesbaniadrummondii. The seed are germinated using 85% H_2SO_4 and sterilized in 0.1% $HgCl_2$. TEM image revealed the synthesized GNPs were spherical shape with 6-20nm of average size range. EDX studies showed that the GNPs were present with agglomeration and look dense. X-ray absorption spectroscopic techniques such as x-ray absorption near-edgestructure (XANES) and extended x-ray absorption fine structure (EXAFS) were used in this study to confirm the oxidation state and form of gold in the plant tissue. XANES spectra confirmed the presence of Gold (0) oxidation state in the synthesized samples. Synthesized samples with 80-85% Gold (0) content was confirmed by LC-XANES fittings. The remaining 15–20% of gold present as gold sulphide. The presence of gold neighbours in the EXAFS is another confirmation for the presence of gold (0) in the plant samples. An absorption peak of 317nm was observed by UV-Visible spectra for the sample containing biomatrix-gold nanomaterial. This type of synthesis undergoes in situ catalytic approach. The used biomatrix nanomaterial have well defined dimensions and monodispersed. This approach may have future applications as a cell-immobilized stable catalyst.

Huang et al.[38] have synthesized MNps (GNPs and SNPs) using Chitosan. It is a polysaccharide prepared from chitin by partial deacetylation. Here the phytochemical is the polysaccharide which acts as both reducing, stabilizing and capping agent. From UV-Visible spectra, a SPR absorption band was at 522nm. SNPs were synthesized by using heparin. It acts as both reducing and stabilizing agent for the synthesis of SNPs. The SPR band was observed at 401nm for SNPs.TEM image revealed the synthesized particles are isotropic. With rise in concentration of heparin, the absorption maximum increases (451 nm). The synthesis of positive or negative charged GNPs or SNPs depends on the polysaccharides which may have many applications in the field of nano-scale superstructure fabrication.

Wanget.al.[39] have reported bio-mimeticpreparation of GNPs using the peptide sequence of MS14 (MHGKTQATSGTIQS). The synthesized GNPs are characterized by UV visible spectrometer & its SPR band was 543nm. Kalishwaralal et al.[40]have presented the bio-synthesis of Gold nanocubesusing amylase. The amylase is prepared form B. Licheniformis. It is acts as the reducing agent responsible for bio-reductionnoble metal salt to GNPs. TEM image showed the synthesized GNPsare spherical in shape with average size of 18nm. The SPR band was at 562nm. XRD reveals the synthesized GNPs are having FCC lattice array with Particle size of 14nm by using Debye Scheerr equation.

CONCLUSION AND PERSPECTIVES

Necessity is the key to invention or discovery. Day by day rapid increase of our demand or needs make research interesting. From the above reviewed discussion it is clear that biosynthesis or green synthesis has profound advantages over physical and chemical synthesis because of its eco-friendly, economic and convenient method of synthesis. The most important thing is in green synthesis no toxic chemical is used or no hazardous by-product is produced. The phyto-chemical present in different parts of plant like bark, leaves, fruit, seed, root or flowers etc. Are mostly responsible for the reduction of noble metal salt ($AgNO_3$ or $HAuCl_4$)and responsible for its stability and capping to prevent agglomeration. Due to its small size, large surface area and non-toxic nature of synthesized MNPs, these have a vast area of application in present aspect and have a bright futuristic scientific research scope. Mainly these are used in bio-medical,bio-sensing, catalysis and effective anti bacterial applications in medicine. The synthesized MNPs should be **properly** characterized using UV-Visible spectroscopy, FTIR spectroscopy, XRD, DLS, and HR-SEM and the antibacterial, antifungal, antiviral, anticanceretc.which may be used in newera of medicinal aspect.

ABSTRACT

Education is considered as the backbone of a democratic society. For the better future of a democratic society, education is highly essential. The process of educating never ends with teaching rather it is completed with learning. The process of learning is completed by internalization of the subjects and their application in everyday life. The new generation students are quite different by their attitude and they are highly techno savvy. Learning through the class room teaching has become a task of boredom for them and at the same time they want education to be imparted in an attractive and interactive form.

In a country like India where education for all has still remained a challenge, providing education through attractive means is also a bigger question and a necessity of the hour. To provide education in a powerful manner there is a need of providing it to people through a user friendly and attractive medium to make learning interesting. These days along with entertainment, the biggest video platform YouTube has become popular among youth as the most popular communication platform which can play a major role in this regard and the study here is an attempt to provide an understanding about the perception of youth relating to YouTube as a learning platform.

Key Words: Social Media, knowledge, information, Development, Technology

INTRODUCTION

Wilber Schramm in his famous book *"Mass Media and national development"* (1964) says "Light is better than darkness and knowledge is better than ignorance". So knowledge is an essential requirement for human beings to survive in a society and education is the means for knowledge. Socrates speaks "Education is the kindling of a flame, not the filling of a vessel", It means education should be provided in such a way that it should inspire the students to gain more and more knowledge. It should help them to empower themselves by learning skills of life. It should help them to solve the challenges of life with the knowledge they have received from their education.

While discussing the above, we understand it that education is an essential requirement for the survival, growth and development of an individual in any society. If education is imparted in a proper way to fulfill the requirements of life, then the individual and the society survive in a better way. A properly imparted education perfectly shapes the personality of an individual making him aware about his and other's human rights. Real education never solves the problems for the person in a real life situation but it empowers him to solve his own life problems in a skillful manner. So in other words proper education promotes empowerment in a learner and enlightens him. In the contemporary social and educational scenario of India, imparting quality and meaningful education has various challenges and there is a need of removing these obstacles from the path. The basic problems those work like road blocks in imparting meaningful education are:

Language

Language as a medium of communication plays a crucial role in exchange of ideas and information. In Indian context, India is a multilingual country and at the same time there is not enough scope for the students in India to learn other languages than the mother tongue. Though the arrival of modern mass media has made Hindi popular in almost all the corners of the country but still the Indian students suffer from linguistic barriers till date. The popularization of English education and development of English as a window language at the world level has raised new challenges in front of the Indian educationists and students. Though speaking and writing of English are no more challenges to urban students but the same issue has remained as a challenge to the students of rural India which lacks from public schools and well trained teachers to impart English education in a better way. Both urban and rural students are equally talented but due to the constraint of English language, students from rural background suffer more than the urban students.

Lack of Communication Skills

Communication skills is one among the important requirements for imparting meaningful education among our students. Because having only knowledge is meaningless for a person if he/she is not able to express it properly at the time of need.

The Digital Divide

After the introduction of the digital technology in India a new form of class system has been introduced i.e. digitally literate and digitally illiterate. The digitally literate population has a better access to knowledge and information system where as the digitally illiterate population is still far away from it. In the digital class system, the digitally literate people are placed in the upper ladder whereas the digitally excluded people are getting placed at the lower ladder of the digital class system. They are getting deprived of the facilities of the digital society and the gap of inequality is becoming wider.

Banking concept of Education

Present educational system prevalent in our country is only based on the concept of retention of information and it is not much efficient to promote learning or developing life skills in a student. To speak in a better way if we analyze our present educational scenario we will find it that our educational system has a large amount of similarities with that of "Banking concept of education" conceptualized in Freirean pedagogy. In the banking concept of education, the teacher holds a key position and the student never becomes a part of the educational system which hinders learning. The process of learning is not participatory and it is completely authoritarian where the teacher imposes everything and the students work with the illusion of learning though they never become a part of the learning process. Thus the banking concept of education has the least scope for learning and at the same time, the banking concept of education being authoritarian and suppressive, kills the interest of students towards learning.

The Teaching Vs Preaching Debate

Teaching as a noble profession is involved with imparting knowledge within the students but in India most of the teachings are purely classroom based having no practical demonstration of the subjects. Again learning through observation and experimentation is too low in case of Indian teaching system. The classroom teaching in which the teacher goes on talking about subjects without creating realization among students also creates a problem for students to understand it and decreases the value of the education. Lack of practical demonstration and active participation between teacher and students is making the process of learning less interesting by changing the status of a teacher to a preacher.

Communicative Ecology and Traditional Knowledge System

Earlier while talking about communication, we have defined it as a process of human experience which plays a crucial role in information dissemination in the process of teaching. Culture as a part of the communicative ecology plays a crucial role to make communication process meaningful for imparting education. As India is a multicultural country so the communicative ecology is different from one place to another and it works as a big obstacle in imparting meaningful education. For example each society has its own model for educating its individuals and this traditional way of imparting knowledge has worked successfully for years among different communities. But before introducing any new approach to the learning system to make the process of learning more meaningful there should be a proper understanding of the traditional knowledge system and cultural values of society.
